DAIRYING.

DEVELOPING THE DAIRY HEIFER

"When I first started breeding dairy cattle I raised all the heifer calves, but there was something wrong; I didn't get results; they were sired by a good bull yet many of them were not equal to their dams as milk producers, and I was pretty nearly disgusted with the whole business. In fact, if it had not been for a visit I made to New York about that time, I would have undoubtedly sold my dairy cows and returned to my previous occupation of beef raising."

The above statement was made to a staff representative of one of our valued exchanges a short time ago by one of the prominent dairy farmers in Ontario. He went on to explain how the calves from even his best cows had been a disappointment, and with but one or two exceptions were not equal to their dams as milk producers. He could not locate the trouble until one day he visited the home of a farmer friend across the border. The latter was the owner of a most successful herd and one that was bringing him results. His methods of breeding were quite similar to those followed in the Canadian herd, but his heifers were much superior. "I at once discovered," he said, "that my failure had been due largely to the fact that I had not been paying enough attention to the feeding and growing of my young stock."

The above confession from a well known dairyman is worthy of careful study, as it brings out a striking example of what we have advocated on several occasions, namely, that the value of the mature animal depends largely upon the treatment received during the first two years of its life, and more especially during the first twelve months. Heifers must be well fed and given every chance to develop because if they do not grow out to proper size before dropping their first calf, they will never do it afterwards. In this connection it is rather unfortunate that statistics are not available whereby it is possible to tell just how many of our unprofitable dairy cows are the result of under feeding during their early years. Breeding, of course, is most important and should receive first consideration in the building up of a profitable dairy herd, but, breeding without feeding is the shortest road to failure. The highly bred animal because of her past environment is not as capable of standing improper feeding and neglect as is her ancestral sister, the scrub.

Feeding is most important, and the man who is raising his own dairy cows is making a big mistake if he attempts to economize on the feed allowance of heifers at any time. By that we do not mean that growing heifers should be given heavy rations of expensive millfeeds; far from it, but they should be given all the good, wholesome, cheap roughage they will consume. It matters not whether that is pasture grass in summer or dry roughage in winter, the effect is the same. Corn ensilage, roots, clover hay, and good quality stra ware not expensive feeds, but they will put the growth on heifers, and that is what is required rather than finish. In fact some of the best grown heifers the writer has ever seen were fed almost ntirely on corn ensilage, roots, and oat straw in winter and pasture in summer. They were given a light meal ration as they neared freshening time, but taking all in all the expense of raising them was not extremely heavy, and they almost invariably developed into fine, large heavy milking cows.

But there are other things to consider besides feeding. Heifers must be well cared for if they are to develop as they should. There is not much use in feeding them heavily if they are allowed to become covered with lice, sick with disease or fall heir to the many other ills that cattle are subject to when they are not properly attended to. Heifers that are heavy in calf should not be allowed to run loose in a shed or box stall because of the danger of injury from hooking or one animal taking advantage of another if got in a corner. Neither should two-year-old heifers be allowed to run loose in a shed or box stall unless they are dehorned. Young bulls and heifers should not be allowed to run together after they are eight months old at most, and it is a much safer plan to separate them several weeks before that time.

Then there is the question of handling and quieting heifers before they freshen, which should not be neglected, for as a general rule heifers that are not handled more or less are nervous and often cause trouble at freshening time. On the other hand those that are handled regularly are almost always docile and practically no trouble when they drop their first calves.

That in itself is quite a consideration as on frequent occasions it has meant the loss of a calf and sometimes the injury of the heifer her self. If a heifer is worth raising she is worth raising well, and any care and attention that tends to make for her improvement should not be neglected. The future of the cow is made during the first two years of her life.—O.U.J.

MILKING COWS REQUIRES SKILL

Milking was formerly, and is still, on too many farms, considered a necessary burden one that has to be taken up twice every day in the year, Sunday and all, and the sooner the work is done the better. Under such conditions no particular attention is given to regularity in the time or the order of milking the cows, the work being, as a rule, done when other farm work is out of the way. The milking has to be attended to, however, both in order to relieve the cows and to furnish the raw material upon which the farmer largely depends for the payment of cash outlays. It is but natural that the work of milking, when done in this way, is not considered particularly important labor. At best, the object of the milking from this point of view is to obtain all the milk in the udder of the cow at the time of the milking.

During late years another way of looking upon the work of milking has become more general, at least among dairymen and breeders of dairy cattle. A closer study of all conditions contributing to success in dairy husbandry has, of course, of late, been brought about by increasing competition, by high prices of feeding stuffs, and by a fuller knowledge of the sciences bearing on the production of milk and its products. This closer study has caused greater attention to be given to individual cows, and to details in the dairy than was formerly the case, and it has, also, brought the importance of the milker

What Should an Engine Weigh?

Abraham Lincoln was asked how long a man's legs should be and be replied, "they sbould be long enough to reacb the ground—and no longer." An engine should weigh enough to do its work—and no more. Years ago it was necessary to cast engine parts very large and beavy, with heavy base and flywheel, or the violent explosions and fast and slow speeds of the old-style engine would tear it to pieces.

Six years ago the Cushman Motor Works designed a new type of farm engine weigbing about one-fifth as much per H. P. as other farm engines, but so well built, balanced and governed that it ran more steadily and quietly than a farm engine was ever known to run. Some people laugbed, and said that an engine weighing only 190 lbs. must be a toy, but when they saw the Cushman at work beside beavy engines weighing five or six times as much, they realized that weight does not mean power, and tbat the Cusbman is a giant in power for its size.

Cushman Light Weight Engines

40 to 60 Pounds per Horse Power

4 H.P. Weighs Only 190 lbs. 15 H. P. Weighs Only 780 lbs.
8 H.P. Weighs Only 320 lbs. 20 H. P. Weighs Only 1200 lbs.

Cushman Engines have Throttle Governor and Schebler Carburetor, insuring regular speed even on jobs of irregular loads, like sawing. Their perfect balance also helps to make them steady, insuring unusual durability and freedom from engine trouble.

The 4 H. P. and the 8 H. P. are mounted on trucks, if desired, and may be pulled around by hand. These are very useful engines, as besides doing all work heavy engines do, they may be attached to machines in the field, as 4 H. P. on grain and corn binders and 8 H. P. on hay balers. All engines over 4 H. P. are double cylinder, which means steadier power.

The Cushman is not a cheap engine, but it is cheap in the long run. Engine Book free.

Besides doing all other farm work it may be used as Binder Engine.

Before Buying Any Engine Ask These Questions

How much does it weigh? If it weighs more than 60 lbs. per horsepower, why?

Is it throttle governed? A throttle governor insures steady, quiet economical power.

Advertise in the Farmer

more into the foreground. It has been found by experience that properly milked cows will better keep up their flow of milk than is the case with cows which are milked in a careless mnaner, whose udders are not thoroughly emptied of milk at each milking, and this flow will be maintained for a longer period of time. Carecul milking, therefore, permanently improves the animal as a milk-producer, aside from directly increasing the milk flow. The work of milking, from this point of view, is as important as any on the dairy farm, and nobody can do it properly but persons endowed with a good share of intelligence, patience an docnscientiousness. It goes almost without saying that when the milker brings suuch qaulifications to his work it will be highly respected and its importance appreciated, as it ought to be, by himself, as wel las by those about him.

COWS NEED REST BEFORE FRESHENING

Practically all observing dairymen agree that it is most profitable to give the dairy cow a rest between lactation periods, and experience has shown that she will porduce more milk annually than if milked continuously. Heavy milk producion is a severe tax upon an animal. The production of 8,000 or 10,000 pounds of milk is a tremendous strain upon a cow, and the individual that can stand up under such heavy work without a rest between periods is, truly, a remarkable animal; however, sooner or later, she will break down under the strain. On the other hand. it is a well known fact that the cow that has been dry for a reasonable length of time will start her next lactation period with a higher production than the cow that has been milked right through to calving time.

How long should a cow be dry? That is a question on which dairymen do not all agree. Some claim that four weeks is sufficient time, others say from six to eight weeks, and the nearer the latter the better. Of course that will depend to a large extent upon the cow and the amount of milk she is giving. Some cows will not milk more than ten months of the year, no matter how well they are cared for; but others will milk right up to the freshening time, and often more or less difficulty is experienced in drying them off. However, the consensus of opinion seems to be in favor of giving the cow a rest of two months each year. That will enable her to store up flesh and start the new year in the best of condition. Some cows, if they are highly fed, may appear to put on an excessive amount of flesh; but if the cow is a dairy animal that will do her no harm. She will milk that into the pail, and slowly, but steadily, that excess fat will go back to the owner in the form of milk. No healthy cow becomes thin without her owner receiving some immediate return for that decliine in flesh, either in the form of milk, butter, or a saving n feed. When a cow loses in flesh she does so for one or two reasons: first, because she is producing beyond her capacity, or, secondly, because her feed allowance is either insufficient or not properly balanced. In the first place, her owner stands immediate gain as a result of her extra production, and, in the second case, he stands immediate gain by a saving in feed, although in that regard he generally loses out in the end. The cow that is fed spasmodically seldom produces the maximum yearly production she is possible of doing, and her feed bill is generally larger than if a steady gait had been maintained.

The good dairy farmer will feed his land as well as his cows. Home grown feeds, especially silage, help the profit side of the ledger.

DE LAVAL

the world's cream saver

Thousands of De Laval Cream Separators have been sold to young people just beginning to run a farm, because a father or friend wanted to see them start right.

The older people knew from experience that the De Laval skims cleaner, runs easier and lasts longer. They also remember the service they have always received from the De Laval Company and its agents.

The superiority of the De Laval and the uninterrupted service back of it are responsible fo rthe fact that there are more De Lavals in use than of all other makes combined.

Any time is a good time to buy a De Laval Cream Separator—to start saving cream, as well as time and energy.

If you want to "start right," see nearest De Laval agent. If you do not know his name, write to nearest De Laval office

Finance and Foreign Exchange

—o—

As discussed by Sir John Aird, General Manager of the Canadian Bank of Commerce at the Recent Annual Meeting of the Bank

Contrary to the view expressed last year, that it was unlikely that we should again shew such large figures for some years to come, the unexpected has happened, and we have made a new record in both profits and total assets. Undoubtedly the continued high level of prices for commodities of all kinds has left its mark upon the balance sheets of financial institutions, and while this condition continues it will be reflected in the figures of our own annual statement.

Increased Earnings

The net profits have amounted to $3,074,000, after a most careful provision for all the doubtful items among the Bank's assets. These earnings exceed those of last year by $224,000, a satisfactory increase of 7.9 per cent., but which compares with an increase of 8.9 per cent. in assets. The figures show that the forces which have been steadily reducing the rate of earnings on the services performed by Canadian banks for the public, to which I referred last year, are still actively at work, and it is fervently to be hoped that the keen spirit of competition, so strenuously active in many directions, will not blind Canadian bankers to this tendency of the times. When it is considered that the three million odd dollars that we show as our net profits represent the combined earnings of over 500 offices, and the result of the efforts of a staff of over 4,000 employees, it will be more clearly recognized how meagre is the showing in comparison with the vast amount of hard labour and heavy responsibility involved.

The Pension Fund

We have paid during the year four quarterly dividends of 3 per cent., or 12 per cent. in all, and now that the war is over and we find it necessary to take up our building programme again, we have resumed our former practice and have written the sum of $250,000 off Bank Premises Account. This is perhaps more necessary now than ever, owing to the extremely high cost of all building operations, which has naturally caused us to limit our programme to only the most necessary work. The release of large numbers of our men from military service, and their return into the service of the Bank, has rendered a large increase necessary in the Bank's contribution to the Pension Fund.

There has been a decrease in our note circulation for the first time since the commencement of the war. The decrease is only $1,536.000, but if it is one of the first signs of a check to the inflation of prices, it is not unwelcome. The increase in deposits of $40,446,000 is the striking item of our statement, and it has taken place almost entirely in the more stable item of deposits bearing interest. The decreases in balances due to foreign banks and in bills payable are almost offset by the increase in acceptances under letters of credit, and none of these changes possess any special significance, save only that the increase in the use of letters of credit indicates a revival of foreign trade as a result of the ending of the war.

Increased Cash Assets

On the assets side of the statement we show an increase of $1,390,000 in cash on hand. The change is more than accounted for by the increase in Dominion notes held, there having been a slight decrease in our holdings of coin. Dominion notes in the Central Gold Reserves are $1,000,000 lower, corresponding to the decrease in our note circulation. There is a decrease of about $1,400,000 in the item of cheques on other banks, which may indicate a slight lessening in the activity of general business, but an increase in bank balances, which leaves the combined total of notes and cheques and bank balances $1,133,000 greater than the figures of last year. There has been an increase in our call and short loans in Canada and a decrease in those elsewhere, the combined effect of all these changes in assets being that our quick or easily realizable assets have increased by $16,892,000, and stand at 49.11 per cent. of our liabilities to the public. Our holdings of Dominion and Provincial Government securities have increased $10,700,000 during the year, largely represented by our share of advances to the Dominion Government which are being repaid out of the proceeds of the last Victory Loan. Current commercial loans, that is, those current loans not classified as "call and short loans," both in Canada and elsewhere, show considerable increases, amounting to $20,837,000 in all, which may be considered as another welcome indication of reviving commercial activity. We have disposed of the Eastern Townships Bank building in Montreal during the year, and this accounts for the reduction in Real Estate other than Bank Premises. The increase in Bank Premises Account is due principally to the acquirement of sites for a number of our newer branches, in pursuance of our general policy in this respect. The total of our assets has grown during the year by $39,333,00 or 8.9 per cent., which under the circumstances we consider satisfactory.

The Bank's Taxes

Some years ago, the year after the outbreak of the war, we took occasion to refer to the subject of taxes paid by the Bank and advised you that the total was about $650,000. It will no doubt be of interest to you to know that the sum taken out of the profits of the Bank during the past year, and applied to the payment of taxes, was nearly double that amount, or over $1.200.000. We have thought it well to speak thus frankly because the opinion seems to be more or less widely held that banks do not bear their fair share of the burdens of general taxation.

Out of the total of 1704 officers of this Bank who volunteered for the defence of the Empire, either in the army or navy, we have reinstated during the course of the year 996, and have still to hear from 253 of them. We have been glad to welcome these officers back to our service, and will do all in our power to assist them to become re-established in civil life. It is our hope that in the course of a reasonably short time they will find themselves at no disadvantage as a result of the loss in banking experience which naturally resulted from their absence. The opening of new branches and the expansion of our business have made it possible to take on the staff again all those who apply for reinstatement.

Employer and Employee

An unlooked for consequence of the war has been the unsettlement of the relations between employer and employed in every walk of life. One of the primary causes of this has been the extraordinary increase in the cost of living, but any one who is forced to grapple with the problems before the employer knows that this can be the cause of only a small part of his difficulties. The deeper and more complex part of them, no doubt, had their origin in that phase of the war, when it took on the aspect of a life and death struggle between the opposing forces. For a time everything had to be subordinated to the turning out of men, munitions and material for use in the war. The Government became, practically, almost the sole employer, the erst-while employer acting as its manager or agent to secure the necessary production. Under these conditions the usual balance-weights and counterpoises of business enterprise were lacking. To secure the necessary production was the only thing that mattered; the cost of doing so was a secondary consideration, and any demands made by employees were granted almost before they were asked. Thus new conditions arose, some shewing marked improvement over those existing before the war, but others such as are foredoomed to failure if put into practice under the usual conditions of peace. It is, perhaps, too much to ask of either employees or employers that they should at once grasp with a clear mental vision all the far-reaching consequences of these changes. Suffice it to say that the adjustments necessary now that business conditions have become more normal are many and difficult, and involve to the utmost a spirit of fairness and a willingness to compromise opposing points of view on both sides. Speaking for our own staff, both permanent and temporary, they have rendered us loyal service in difficult days, and we have sought to give generous and sympathetic consideration to the difficulties which have been particularly their lot, as salaried men and women, during an extraordinary rise in the cost of living.

The 1919 Victory Loan

In November last the Canadian Government issued its sixth War Loan, the money being required for purposes connected with the transition from war to peace. The Minister of Finance, Sir Henry Drayton, again asked for a minimum of $300,000,000, and the total subscriptions received were $676-242,790, almost as much as subscribed to the previous loan. The Minister of Fnance, and the country itself, are to be congratulated most heartily upon this new demonstration of the financial strength of Canada. There was a large reduction in the number of subscribers, the total number being 789,532, as compared with 1,140,057 in the case of the 1918 loan, so that the average amount subscribed was considerably larger, being $857, as against $610. It is interesting to note, as showing the popularity of the Victory Loans among small subscribers, that in the case of the 1917 loan $100,300,000, and in the case of the 1918 loan $104,500,000, was issued in $50 and $100 bonds. The corresponding figures for the 1919 loan are not yet available, and owing to the reduction in the number of subscribers the total will probably not be so great, but it is evident that about $300,000,000 of the last three loans has been obtained in this way.

Depreciated Exchange

The condition of the foreign exchanges is one of the problems with which we have had to deal during the past year, and it is one in which the people of Canada are deeply concerned, as it has a very direct effect upon their economic life. Canada is not alone in suffering from the effects of a depreciated exchange, in fact, it is a condition now familiar to almost every country in the world. The artificial expedients which have been resorted to in order to correct the situation, such as the shipping of gold, the sale of securities and an attempt at fixing exchange rates, are inadequate and may even prove dangerous. The rehabilitation of our dollar can only be accomplished by saving, economy and greater production. It has perhaps become fairly generally known among those who take an interest in the matter that our imports from the United States greatly exceed our exports to that country, and that in the case of Great Britain to reverse is true, our exports greatly exceeding our imports. Therefore in the case of our trade with the Untied States there is a scarcity of bills receivable which we can set off against our bills payable to that country; while in the case of our trade with Great Britain the reverse is true, and the bills receivable exceed the bills payable to such an extent that she has been forced to obtain credit from us for many of her purchases of food-stuffs produced in Canada.

Foreign Credits

There is much more, however, in the situation than this. We have been selling on credit to France, Belgium, Greece, Roumania, and to some extent to Great Britain, manufactured goods, the raw materials of which are largely imported from the United States, and we are called upon to pay for these raw materials in cash. In addition to this, the interest payments on our debt abroad have increased, as well as the heavy shipping charges which have to be paid on water-borne goods. In paying for the raw materials referred to we are forced to use up a large part of those funds ordinarily available to defray the cost of our normal imports from the United States. The scarcity of United States funds has thus been accentuated by the increased demand, while the source from which we have been wont in the past to make up any deficiencies, that is, the balance due to us by merchants and others in Great Britain, is not now available for this purpose for two reasons; first, that Great Britain is not settling in cash as in the past; second, that such part of this indebtedness as might be made available for the purpose is not now acceptable to the United States as payment, because that country has already a surplus of British debts which she is anxious to realize. If to these factors in the problem be added the effect of increased purchases of luxuries imported from the United States in the present era of free and easy spending, an idea will be obtained of at least some of the main reasons for the present situation.

British Imports

It should not be forgotten in any discussion of the position of the foreign exchanges as affecting Canada, that so far as imports to this country are concerned the position of the British and Continental exchanges is just as favourable as United States exchange is unfavorable. The difficulty in this case is one of supply. Judging by recent accounts, however, Great Britain is bending all her energies, in spite of labour troubles and other adverse circumstances, to resuming her place as an exporting nation, and now that the difficulty of securing vessel space is decreasing, we shall hope to see a decided increase, in the near future, in imports from the mother country of those goods of which we stand in need, and which cannot be produced at home.

Buy in Canada

On the other hand in our relations with the United States we should aim to decrease our imports, especially of those articles which are merely luxuries, or which can be produced equally well at home. The position of exchange at this moment is a lesson that our dollars can be more advantageously expended for a home-made article than for one manufactured in the United States, and it is to be hoped that this practical lesson will not be lost upon our people. Its influence should

be strengthened by merchants and importers discontinuing to import for consumption in Canada such unnecessary articles as we have referred to.

To sum up, then, there is no royal road to the rectification of the foreign exchanges. Hard work and self denial, such as will increase our income as a nation, and decrease our expenditure, are the only sovereign remedies for the disease. Harder work and greater diligence are needed to increase production, and self denial implies the cessation of purchases of imported articles which are only luxuries or can be produced at home. We doubt, however, whether ought save stern necessity can enforce these conditions upon our people.

P. E. I. URGED TO PRODUCE MORE BUTTER

(By Hon. W. M. Lea, Minister of Agriculture)

At the price now being paid for creamery butter, it is to be regretted that we are not in a position in this province to produce a greater quantity of this valuable article. High as prices for raw products of the farm may be, the sale of these lessens our soil fertility to such an extent that we either purchase expensive commercial fertilizers or be situated so as to be able to use natural occurring fertilizer, otherwise we reduce the earning capacity of our farms by such sale; but the more butter we produce the more fertility we add to our soil, when we sell butter fat off our farms we are marketing "Sunshine" alone, and for this reason the money received for this product is better money than from the sale of any class of raw products. However, even at present prices we can feed our crops at a porfit to the right class of dairy cows. We must bear in mind the fact that the butter and other live stock products of the world are not manufactured at a loss by the countries specialising in their products. Not only do they feed practically all their home grown crops, but import largely of foreign mill feeds as well, but our dairy cows can produce butter from grass alone and from the heaviest producing crops grown on the farms, crops which yield the greatest quantity or tonnage per acre, such as the different varieties of roots grown and the green feeds that may be sown over longer period and give us more time in which to plant a large acreage and a guarantee against crop failures possible to our grain and hay crops, and while it is possible to feed our grain or other crops for butter with profit at present prices of each, we must have the right kind of dairy cows, suitable housing, and have a knowledge of a proper balanced ration to secure the best returns as it is easily possible for us to waste feed, if any of the above conditions are lacking, but we may easily learn by experience to be economical and efficient feeders and by proper selection and breeding secure a paying herd of grade cows, which will average from six to ten thousand lbs. of milk per year. We have quite a number of herds in the best dairy districts giving that quantity and earning upwards of $200.00 per cow at our creameries and cheese factories. They are patrons of the creameries that manufacture the year around and hold their best customers by continuous yearly supply of the highest quality of butter, which usually commands 10 cents per lb. over the home made product. Not only do home makers lose at least this sum of money, but besides the work entailed in home manufacture there is a loss in weight, as we know that the best quality of butter may contain 10% moisture when this is worth 70 cents a pound the skilled creamery makers see that they incorporate the full amount allowed them by the law, and qualified as all home dairy makers believe themselves to be, the inspectors rarely find dairy butter containing over 5%, or at least 6% moisture, and much of this in a loose state leeching from the butter; there is a lot of unnecessary labor and loss in home dairying, and no country can hope to develop the industry by any such disorganization. The time is long past for individual effort in manufacture or sale of any farm product capable of being handled on a co-operative basis, and we must all endeavor to cultivate that unselfish spirit that aims for the most good to the greatest number, continually keeping in mind the truth, and withdrawal of our support may weaken the effect for the betterment of any form of co-operative effort, and it is only the most selfish and unpatriotic that will withhold their suport from a creamery until they see if it will prove a failure or success. We should all support it to the best of our ability and guarantee its success.

The men who are the most successful farmers are those who add the greatest amount of fertility to their farms during their tenancy and pass them on to those who may follow producing more each year. The amount depends principally on the fertility of our farms. The amount of fertility applied depends on the quantity and quality of feeds consumed on our farms, and the man who produces wealth from the production and sale of animals and their products at the same time creates wealth of soil and a more productive provicne from year to year is a producer and a builder. The man who sells raw products without returning fertility of some nature to make up the deficiency caused by their growth is a destroyer of soil fertility and of provincial wealth. All things are possible with fertile land; we can hardly pay too much for a rich fertile farm, nor too little for a poor run out one. Our success as farmers and our development as a prosperous progressive province will largely depend on the system of farming we follow whether we are adding to or reducing the earning capacity of our farms. No ambitious farmer should be satisfied to even hold the farm after cultivating at any given state of fertility when it is easily possible to increase the earning power from year to year by a judicious system of live stock farming.

NOTICE !

Having an attractive proposition to offer to any Stockman (Company or otherwise) seeking the services of an experienced "Farm Manager", would ask them to write for particulars to

Now is the time you need an

IDEAL GREEN FEED SILO

It provides succulent feed during the cold winter days, which enables the cows to give 25% more milk than if they were fed on a dry feed ration. And a silage ration is considerably cheaper than a dry ration.

At the present high prices of milk and butter-fat, no dairy farmer can afford to go through another season without a silo. Soon the rush of spring work will be on and the question of getting a silo may again be sidetracked.

Plan for your silo now

An Ideal Green Feed Silo will make better silage than any other silo, and will last longer. Thousands of Canadian cow owners have proved this to their own satisfaction.

Write to nearest office for catalogue, which describes the Ideal Green Feed Silo and gives valuable information about silage.

DAMP HENHOUSES

Damp, rainy, blustery weather causes more poultry ailments than cold weather. No matter how cold it is, there is no danger if the weather stays clear and the air dry. At such times there is nothing to prevent turning the hens outdoors for the usual time each day. In the house give them litter to scratch in and allow them to keep warm by healthy exercise.

Roup seldom appears in dry weather. Drafts and dampness usually cause it, and also various ailments in little chicks, especially early-hatched ones. In fact, poultry of all kinds suffer greatly from exposure to damp weather. The solution is a dry properly-ventilated house, and the fowls confined during the damp days, or until

A combination of good poultry stock, properly housed and correctly fed, is a sound proposition. Under such conditions, poultry is the crop which never fails.

THE HORSE

FEEDING HAY TO FARM HORSES

During the winter time on many farms, the horse's chief occupation is munching hay. Feeding hay to horses is considered such a commonplace job that anyone who is capable of filling a manger with it is supposed to be quite capable to feed horses in winter. Horsemen generally have much to learn on the subject of feeding this staple feed to farm horses. The average man allows his horse to be the judge of how much hay he should have, this being gauged by the animal's capacity, and thus many a good horse is ruined.

Hay for the Idle Horse

Idle horses call for as skillful management in feeding hay to them as do work horses. What is needed by the idle animal is a good maintenance ration, one containing sufficient nutrient to rebuild the tissues of the body as fast as they are broken down by the every-day activities of the vital organs. This can be accomplished only by regular and careful feeding on a good allowance of clean, palatable hay and a fair quantity of wholesome grain. Horses should not be confined to hay alone. The greatest mistake usually made in feeding idle horses is that of giving too much hay in order to save grain. This practice seriously impairs the digestion, if continued for any length of time. From 10 to 15 pounds of hay per day, according to weight of animal—that is, about one pound of hay for every 100 lbs. live weight of animal—is entirely enough hay when given with a grain ration of from six to eight pounds per day. A small amount of oats or bran is a large enough grain ration for idle animals.

Of course, if horses are exposed to the rigors of winter without comfortable shelter, more grain will be required than otherwise. But shelter is cheaper than feed.

Every farmer wants to winter his work horses as economically as possible, but it is to be regretted that some farmers practise economy in the wrong direction, and feeding hay in excessive quantities to save grain is one of the ideas. The important point to keep in mind is that horses must be so treated in winter that they will come out in the spring in the proper condition to take up work, and perform steady, every-day service.

No Life or Snap to Them

Some horses will eat much more hay than the amount mentioned above, but it is a mistake to increase the quantity, as a horse can only digest and assimilate a certain amount. Keep in mind that his appetite generally goes beyond his powers of assimilation. In many cases horses that eat large amounts of hay become hard-looking, while they have little life or snap in them. Men go on from year to year with their horses in this condition without knowing anything about its cause.

There are generally a few chores that a comparatively idle horse has to overtake daily or at longer intervals on the farm. The practise gives him the necessary exercise, but he should be fed with the same regularity and care as if at heavy work, but with a lessened quantity of grain. The one pound of hay per 100 pounds of live weight and one pound of grain ration per 100 pounds of live weight is, on the average, sufficient to keep work horses in trim, but half that amount of grain is sufficient for the idle or comparatively idle horse.

Hay for horses should be bright and clean and of the best quality. Extra quantity of poor hay to make up for loss of quality is a horse-killing procedure; laying the foundation for the diseases that assuredly follow such practices. The question of variety of hay to give a horse is not of such vital importance as the condition in which the hay is cured and kept. It goes without saying that it must be fresh and not overripe when cut, and if this is the case the kind of hay does not matter so much. Personally, the writer has a preference for timothy and clover, mixed in about equal proportions.

Timothy Versus Oat Straw

There is divided opinion about the feeding quality of timothy, but although timothy hay is not very rich in nutriments there is something about it that the horse dearly loves, so that it should be kept in mind that palatability has much to do with digestibility and therefore it is wise to cater to some extent to the animal's tastes. But woody and fibrous timothy hay that has been overripe when cut is very indigestible. Even bright, clean well harvested oat straw excels it in feeding value, and horses as a rule prefer it. Oat straw is largely fed to horses in Scotland but it is made entirely free from dust, chaff, etc., as the oat sheaves are put through the separator.

In dividing the quantity of hay set apart for horse feed daily, it is advisable to use only a small amount in the morning and also at noon, thus making the night feed somewhat more liberal, though not more than what the horse will clean up in a reasonable length of time, and then lie down for a comfortable night's rest. Also in connection with sensible hay feeding, it should be mentioned that horses should receive water before and never immediately after a meal.

Those who have never weighed a horse's daily feed should do so, to get some idea of the bulk of 20 pounds of hay from 30 or 40 pounds. Once a feeder is accustomed to the quantity by weight he can easily arrive at the same conclusion by what he carries in his arms or on his fork. Systematic

feeding of horses will pay the extra trouble to get into the expert daily rut of doing so. Horses kept in winter as herewith explained, will keep fit and ready every day of the year, like well oiled engines that have their mechanisms ready for immediate starting.

It is really wonderful how careful some men are about the engine of their motor car, tractor or the stationary one at the barn, and how careless they are about the animal engine in the horse stall. There can be no true economy in farm power till the horse gets the due attention in winter which his indispensable position on the farm merits.

VALUE OF THE HORSE BLANKET

One thing is evident in the horse-breeding business, that it is only the man who knows enough to care properly for his horses all the year round that can go in for keeping high grade or pure-bred stock. It is all very well to say that every farmer should get the best of horse stock to breed with, but stock of this class cannot be maintained by scrub methods. This article is being published in The Maritime Farmer with the purpose of encouraging farmers to get away from keeping the unsound and ill-bred runt. If a farmer cannot keep a team of scrub horses in flesh and heart it is a foregone conclusion that he never will do anything with pure-bred or high-grade animals. Better let live stock, of any species, alone unless one is prepared to give it high-class care.

Make Money This Winter—Saw Wood
There is big money this winter sawing wood. Coal is high. Wood will be scarce. Now is the time to clean up. The GILSON HEAVI-DUTI SAWING OUTFIT is the machine to do it with. Makes its own spark without the aid of batteries. You cannot afford to buy any engine until you know all about the Gilson Heavy-Duti. When you know about it, you will not buy any other. Catalog and information free if you act quickly. Write to-day.

Blanketing the Horse

The necessity or use of a blanket for a horse does not seem to be very well understood. But the proper use of a blanket is of first importance. So long as a horse has got a blanket and it is thrown on to him without much thought as to the horse's needs or feelings in the matter, it is not considered by some horse owners to be of any vital importance to the animal's health or condition.

The usefulness of a horse can be prolonged, and his efficiency increased by proper blanketing and grooming.

On arriving at the stable very warm and sweating, the horse should not be blanketed until he has ceased to steam, nor should he be left in a draft. If blanketed at once, little opportunity is given for him to dry off, the blanket will become damp, and the hair remain so all night.

How would the owner of a horse so treated like to be wrapped up in a heavy overcoat when he is steaming hot and, perhaps at the same time, confined in a stuffy, badly ventilated home. Everyone knows how dangerous it is for a heated person to expose themselves in a draughty situation. But to both these conditions many owners subject their animals. A little consideration of what they would do if they were in the same condition as the horse finds himself in, would go a long way in keeping the animal in comfort and efficiency. If a blanket is not used until the animal has ceased to steam and is somewhat cooled, whch will be in a quarter of an hour or so, the hair will be dry and smooth the following morning.

A Common Practice

The common usage that a large number of horses have to put up with is not at all conducive to horse improvement through proper stall care. It is common practice after the day's work to hurry the horses into the stalls, unharness, blanket them at once, feed and leave them for the night. In the morning there is eager endeavor to get to work early, the horses are fed, the blankets removed, the animals' bodies groomed but very little, the harness is put on, and in a few minutes the horses are at work. Animals thus treated stiffen in the joints and develop leg and foot diseases.

In a cold winter climate such as is found in Canada the use of blankets is indispensable. Horses prove more efficient and endure much longer if reasonably protected against sudden changes of temperature and exposed to cold, wet weather. An early use of blankets in the fall will arrest the growth of hair, and in the opinion of The Farmer will obviate the necessity of clipping. For horses that are used for farm work clipping is not advised, at least in the fall and winter months. There may be some advantage gained by clipping the upper half of the legs and under the abdomen in the spring time, but the growth of hair is controlled where blankets are used wisely. If a horse is clipped it will require extra blankets and close attentionn to their use to keep animals in heat and health. As soon as nights begin to get cool the heavy blanket should replace the light summer one.

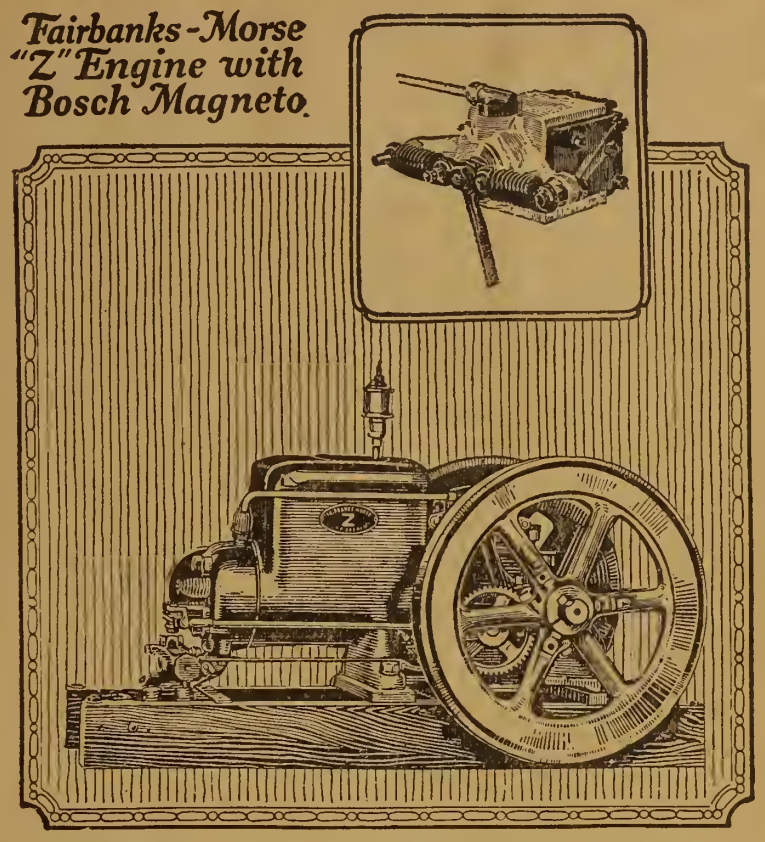
Heated Team in Zero Weather

Today, with the mercury near zero, the writer passed a farm team standing at the door of a store. They were steaming from the exertions of a hurried journey of several miles, hitched to a loaded wagon. Twenty minutes after the horse blankets, neatly folded, were still on the driver's seat board, and the horses showed evidence of feeling the cold. It is farmers of this class that have most to say about the inefficiency and expense of horses as a motive power on the farm.

There is as much need for the outdoor blanket as for the stable one. If horses are allowed to stand out doors, either for a short or for a long time, they should be well blanketed. If any one is going to stop but a short time, the temptation is strong not to blanket the animal. The horse cools off rapidly and may chill, so that it is best to blanket though only for a moment. It is best, on stopping the animal, to see that he is well protected at all times. If a driver would take some of the lessons that experience teaches him in regard to his own comfort, and treat his horse humanely, there would be less heard about sick and inefficient horses.

The Greatest Combination

Fairbanks-Morse "Z" Engine with Bosch Magneto



WHEN the full meaning of this "Z" message is realized—mighty few farmers in Canada will fail at once to call on the nearest "Z" Engine dealer. ¶ This example of master engine building must be seen. ¶ Type and pictures can but suggest this value establishing achievement. ¶ By adding this one possible betterment—Bosch high-tension, oscillating magneto—we complete a rare engine service, fully maintained by all Bosch Service Stations throughout Canada in co-operation with every "Z" Engine dealer—for all "Z" Engine owners.

COURAGE

Courage! What if the snows are deep,
And what if the hills are long and steep,
And the days are short, and the nights are long,
And the good are weak, and the bad are strong;
Courage! The snow is a field of play,
And the longest hill has a well-worn way;
There are songs that shorten the longest night;
There's a day when wrong shall be ruled by right.
So courage! courage! 'Tis never so far
From a plodded path to a shining star.

MEN AND MONEY—A STORY WITH A PURPOSE

(By Nellie McClung, author of "Sowing Seeds in Danny," "In Times Like These," etc.)

In a certain small prairie town in Western Canada, twenty-five years ago, two houses were built side by side. You will perhaps remember them when I tell you that they stood on thirty-three foot lots and were painted a stone color with brown trimmings. Each had a door and a large window in the front, with a small verandah, over which were two small windows; each had a gray roof and lean-to kitchen, and the houses were divided from each other by a stone colored and brown fence, painted with what was left over from the houses.

You do not need to be told that the same man had built them, owned and rented them, and you know he was a dull fellow, without imagination, or he would have put a dab of red paint somewhere in the trimming of one, and green in the other, or an extra gable in one, or another sort of kitchen, or put the chimney or a window in a different place or made some change to break the spell. But he did not do any of these things because he had simply built them to rent, and renters are expected to be glad of anything to live in, and not to expect too much for twelve dollars and fifty cents per month, strictly in advance.

The front door opened into a small hall, whose meagre space was partially taken up by a gray painted stairway, and which afforded the occasional caller a full view of the inward workings of the kitchen, unless the door at the other end was kept shut; but the careful housewife overcame all danger of such exposure by hanging curtains over the door space. The living room was to the right as you came in the front door, and the dining room was separated from it by an archway, and more curtains. The dining room had one window, whose upper portion contained squares of red, blue and amber colored glass; the large window in the front room followed the same design. The walls were plastered and the floors were of fir.

By these peculiarities, I am sure you will know the houses I mean.

Well, as I said, there were two of them side by side, and by a curious coincidence, they received their occupants the same day, and both mistresses were brides. William Brown, book-keeper for an implement firm, who had gone east and married Stella Morrow, of Peterboro, and Herbert S. Wilson, banker, who had married Miss Summers, one of the teachers, were the tenants, and the people of the smal ltown called that street "Honeymoon Avenue."

When the observant ladies of the Reception Committee of the Ladies' Aid called on the two brides, which they did in due course, they were unable to decide who had the best furniture. Mrs. Wilson had a green carpet and green chenille portiers; Mrs. Brown's were dull blue; Mrs. Wilson's china was the tea rose design, Mrs. Brown's was the gold clover leaf; Mrs. Wilson had house plants; Mrs. Brown had a bird; Mrs. Wilson had a silk eiderdown on her spare room bed, Mrs. Brown had a crocheted bedspread which her grandmother had made.

After careful discussion, the visitors of the Reception Committee were unable to institute a comparison, which should be abundant proof that the house of Wilson and the house of Brown had got away to a fair start.

At the end of the first year, the equality which had existed between the two families was at an end, for there came into the Brown home a small, pink, blue-eyed infant, who constantly mistook the night for day, and persisted in wanting everyone to stand at attention.

Mrs. Wilson, who ran in the first afternoon to see him, presented him with a handsome garment, replete with blue bows, which she had bought the week before at a church bazaar, because, as she explained to her husband, "it was so hard to get out without buying something." It was really a very handsome present for the young barbarian, who mistook it for something of an edible nautre, and even the first time it was put on him, chewed one o fthe dainty blue bows into shapeless squadigness. But this misdemeanor did not decrease his mother's admiration.

There were times, of course, in the first six months, when she wished he was not quite so imperative, and she often wondered how he could tell when she had gone down cellar for vegetables for dinner, and why he raised such a piercing wail every time she went out of the room. But she always rushed to him with breathless haste, fully expecting to find that some evil had befallen him. When she reached his crib and found that he was still intact, her thankulfness always drove out her indignation, and when he flashed his blue-eyed, two-tothed, dimpled smile at her, she forgave him freely, and marked his "board and keep bill" paid to date.

The observant caller would not have any difficulty in deciding which house had the best furniture after the first year. The Wilsons now had a new and handsome Turkish rug in their living room; the Browns had a cradle in theirs; the Wilsons had Japanese grass mats and swinging chairs on their verandah, the Browns had a baby carriage on theirs. But there was no envy on either side of the mud brown paling which divided the two houses; everybody was satisfied with what they had. Someiimes, indeed, when young John Brown, dreaming of wolves, bears and kidnappers, awakened with loud wailings in the middle of the night, the Wilsons, hearing him, were sorry for their neighbors and were very glad that the quiet and calm of their own lives had not been disturbed by one of these overbearing young things who know nothing of that unwritten law regarding the right of others to undisturbed sleep at nights.

Young John Brown awakened regularly at the hour of five each morning, and insisted upon his parents doing likewise. Perhaps it was the spirit of his industrious grandmother, the one who had made the crocheted quilt, which had ben inherited by him, for he loathed late sleping, and saw to it that both his parents began the day bright and early. Having accomplished this by the simple and unaided method of the human voice, young John settled down to a calm and refreshing sleep, during which time his mother, on tiptoe, hurried through her work, to be ready to take him out when he awoke.

Her neighbor joined a literary club that winter, and studied Maeterlinck, and Matthew Arnold, fragments of which she pased on to young John's mother,—who said when the baby was old enough to take with her, she would be able to attend the meetings too. But the first time she took him to church, he tried to usurp the attention which, by all laws of fair play, belongs to the minister, and so had to be taken out in disgrace.

John's father saw in his bounding energy large possibilities of future greatness.

"Notice the shape of his head, Stella," he often said, "it is a perfectly rounded head, indicating a well-balanced disposition,—see the full forehead, with observation and reasoning equally full—veneration and conscientiousness especially large. This boy will never shirk his duty:—Never mind, Stella, even if you can't get out to the Browning Club, or whatever it is, you're doing something when you are bringing up young John Brown. You'll have more to show for your time than the members of the Club, in the spring."

"Of course will," John's mother said happily—"I expect John will be walking then, and won't I be proud when he can step out with me in the afternoon, in his blue suit and white straw hat, and is able to pass the time of day with his neighbors. He tries to say things now, and I think that's very smart for a baby only ten months old."

"He's a wonder," declared Mr. Brown, with conviction.

When John passed his first birthday, began to walk on his fat, uncertain litle legs, he had his first photograph taken, and the friends on both sides of the house were remembered in the distribution. Most of them wrote back, with strongly expressed admiration; some with faint words of praise, and one unhappy aunt sent not a word, and was struck off Mrs. Brown's correspondence list forthwith. Mrs. Brown was too amiable a woman to be resentful even of such neglect, but she considered that any one who was not moved with tdmiration on beholding such a beautiful child's face, was too dull to bother with.

"When I go East, I'll go to see Aunt Grace, and ask for the picture. Evidently it is of no use to her," said Mrs. Brown.

Mr. and Mrs. Brown's good opinion of their son was further enhanced,

when, soon after his first birthday, he began to talk. Just what he was saying seemed to be unknown, except to the imemdiate family. But it was as plain as day to them. When asked what the kitty says, and what the cow says, and what the pig says, the answers he gave were strikingly similar in each case, but outsiders are often dull in such matters.

At sixteen months, he had learned one unmistakable trick—he saluted and responded when his name was called. "John Brown," called his father, when he entered the front door and John Brown, in whatever part of the house he happened to be, struggled to his feet, and placing his heels together, stood very straight, and raising one fat hand, answered:

"Present."

At least his parents said that he said "present," and it certainly sounded as much like that as anything else.

His next trick was to tell, with unfailing acuracy, where his papa's boy boy was, by patting his own blonde head, and giving utterance to an animated whirl of sounds, which seemed like a sucecssion of "da's," but which his parents had no difficulty in understanding. What the child said was, "Right here, right here!"

The Wilsons were brought over to hear John's tricks, and although he did them beautifully, and they laughed in apparent enjoyment, there was a slight lack of heartiness about their applause, and if John had been a real actor, he would have known that his audience was in full accord with him, and that for some reason he had failed to put it over; but John did not care anything aobut their applause anyway—he had two devoted slaves on the front seats, and he did not look past them.

When the Wilsons went home, they laughed a little about John's tricks. "The Browns are nutty over that kid," said Mr. Wilson—"they make me tired sometimes."

His wife suddenly went serious. "It's nice to be silly—sometimes," she said wistfully. "I often wonder . . . and wish——"

"I don't see it," he said; "rasiing a squalling kid does not appeal to me—it is too much like work—if you want to, you can adopt a half-grown one—past the howling age—I can't see mysel fparading up and down in my nightshirt, singing 'Beulah Land' the way Brown did last summer. Echoes of the coming across the fence was enough for me. A kid costs tooo much time, sleep and money, and I tell you, May, they're not worth it—Now that's the straight truth! Look at my father and mother—they raised eight, and my mother was an old woman with a bonnet, at forty. She never had a good time—she just slaved for us kids. Every last one of us now are married and gone, and the two old folks are there alone. We write at Christmas and send them a shawl and a pair of gaiters, that's all the communication there is between us—It isn't fair, but what can we do? I can't talk to my mother for five minutes—we belong to different worlds—She couldn't raise kids and read the newspapers too, and she dropped behind. Maybe she doesn't know it, but I do. It's nobodys fault, I guess—but it's uncomfortable, and I can't see the sense of raising a family, and losing all the fun in life."

They had argued the question before, and always to the same conclusion.

That afternoon when Mrs. Wilson was going down town for a hair-shampoo and manicure, and saw her neighbor hanging out a washing, with young John holding on to her skirts and clamoring loudly for attention she rejoiced in her freedom, and the pleasant life she had. Bert was right, children were too much trouble!

The next summer, John had a little brother, an exact duplicate of himself, blue-eyed, dimpled and imperative. In the hot nights, when the windows were open, the piping wail of the new baby often broke into the nightly stillness of the street. These fidnight distrubances helped to decide the Wilsons to make a visit to the Coast, though they had a feeling of real pity for their neighbors left behind to struggle with the heat and the two young children.

"Maybe they like," said Mr. Wilson, when his wife was saying that she felt mean about leaving her neighbor, "some people do—it is a real instinct with some people to care for kids—but I must say it's not so with me—and you can't do them any good by staying—you don't know how to mind a kid anyway."

"She didn't know, either," persisted Mrs. Wilson—"but she's learning—I could learn too—if I needed to. I wouldn't be afraid to try it"—

Then she added quickly—"But I am glad I don't need to learn just now."

That winter, the baby, whose name was Tom, had a serious illness, requiring a trained nurse and a specialist. For a few days it looked as if he had decided to give up the journey on which he had started out so joyously six months before. His dimpled face, now shrunken and wrinkled like an old man's, haunted his father as he went about his work—it was too cruel, that anything so little and so sweet should suffer pain.

"Brown walks like an old man," Mr. Wilson told his wife that day as they

"You Are Under Weight, My Boy"

"YES, sir."

"Do you know what that means?"

"No, sir."

"It means that your body is not properly nourished. You are not getting the right food, or else not obtaining full benefit of the food you eat! Are you easily tired?"

"Yes, sir."

"How are you getting along at school?"

"Not very well."

"Now, I am going to send a report to your parents, so that they may know your condition, and I want you to do what I tell you, so as to regain your normal weight."

"All right, sir."

"You can never expect to get far in athletics, or school either, so long as your blood is thin for lack of proper nourishment and your nerves starved and exhausted."

"We shall go a little easy on exercise, and I have asked your parents to see that you eat plenty of plain, nourishing food. I have also suggested the use of Dr. Chase's Nerve Food, so as to enrich the blood and tone up your nervous system."

"Is that a medicine?"

"Yes, I suppose you might call it that, but it is entirely different to most medicines, because it builds up tissue instead of tearing it down. It is what is called a restorative. It sharpens the appetite, improves digestion and helps you to obtain full benefit of the food you eat. 'We are not much on medicines around here, but Chase's Nerve Food has helped so many under-weight boys whom I know that I never lose an opportunity to recommend it."

"I hope it helps me, for I would like to be able to do 'stunts' like the other fellows, and I don't seem to have the strength now."

"You are ready to do your part then? That is what I want to know."

"Yes, sir, I am."

"We will weigh you every week, and I am sure we shall soon have you all right."

Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Ltd., Toronto.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Mrs. M. Summers

Box 309 WINDSOR, Ontario

NO WOMAN

CAN BE STRONG AND WELL

WITH WEAK KIDNEYS.

Women try to bear the daily burdens of the household, but the continual stooping, bending, never ending strain on the back, sooner or later, may end in some form of kidney trouble.

When the back aches or becomes weak it is a warning that the kidneys are affected in some way, and on the first sign of any weakness Doan's Kidney Pills should be taken, so as to strengthen the kidneys and prevent some future trouble.

Mrs. Joseph Jarvis, 152 Niagara St., Hamilton, writes:—"I was so troubled with my kidneys I could hardly sleep; I could not do my work, and was a burden to myself. I used Doan's Kidney Pills and they sure helped me, and I would not be without them in the house. I can sleep better now than I have for years."

Doan's Kidney Pills are put up in an oblong grey box; our trade mark a "Maple Leaf"; price 50c. at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

sat at lunch in the hotel. They had been out late at a dance the night before, and she had phoned to his office that she did not feel like cooking, and suggesting that they "eat out."

"I guess it would be a relief is the little kid did pass out. They can't afford nurses and doctor's bills like this. Brown was in today to see how much he could borrow on his Life Insurance, and I gathered from what he said, they are pretty well up against it!"

Then they talked of other things.

But young Tom Brown did not die. There came a day when the troubled look went out of his tired eyes, and he knew his mother when she bent over him.

When Brown came home to dinner, he did not get a chance to make his usual enquiry, "Well, how is he?" for his wife was waiting at the door, with the first real smile he had seen for months.

"Billy!" she cried—"Oh, Billy, he's better—he's going to get well!"

And then, quite without warning, she, Stella Brown, the brave, patient, tearless one, buried her head on his shoulder and cried, and cried.

Softly stroking her hair, he noticed for the first time that it had in it streaks of gray.

It was a hard pull for the Browns to recover from the financial depression following the baby's illness. The specialist, who had been twice to see the child, was able by that occult gift which many specialists possess, to divine the amount of their savings, and make his fee cover it exactly.

"I wonder how he knew how much we had," said Billy Brown, reflectively, as he wrote the check which signed away all their savings for the last six years.

"That's part of their course at college," said his wife gaily. "Never mnid, Billy, we have the boys to show for our time, and we're still young and strong. We'll start another savings account on the first of the month, and we'll have garden stuff to sell, and our clothes will do for another year. We've enough left from the Insurance money you borrowed, to pay the nurse and our own doctor, and the bill at the drug store, so we start even again —that's not so bad."

The two families did not see so much of each other in the years that followed, for the Wilsons moved into the big house which they built on another and more fashionable street, and sometimes months and months passed without the women seeing each other. The men met occasionally at the Business Men's Luncheons which were given once a week, and always regarded each other with real friendliness. Mr. Wilson, in speaking of his old neighbor, said to his wife:

"I like Brown—but the stories he tells about his kids certainly make me tired. The man doesn't notice that he's shabby himself, and getting into a groove. He works in his garden as long as he can see, and then gets up early and goes at it again. But he's bubbling over with enthusiasm all the time about the kids, and showed me their school reports. The kids are hustlers all right, and young John works in the printing office after school and is earning a set of books that way. The other fellow keeps chickens and has bought a bicycle. You'd think it was an automobile, to hear Brown talk about it. The man's simply dippy over those two youngters."

"Well, I don't wonder," said Mrs. Wilson, "they're handsome and clever and the most beautifully mannered children in town everyone says. Mr. and Mrs. Brown will realize all their own ambition, in the boys, and that's something. They see their own dreams coming true, and that makes labor sweet and satisfying."

"But they never have a trip or any fun," said her husband.

"They get their fun at home—and that's the best place," she said. "Teas and dances and clothes don't satisfy every woman, you know, Bert. Some of them have deeper ambitions than just to be well dressed and able to play cards. . . . I sometimes envy the Browns——"

"They're welcome to the kids,—so far as I am concerned," he said shortly. "It's cost poor Brown all his salary to raise those kids so far, and now comes the most expensive time, for they have to be educated. He never takes a holiday—he does curl, but he never goes away for bonspiel."

"But they seem happy," Mrs. Wilson urged; "there aren't two people in town who stick together like the Browns—Don't you remember that Sunday afternoon we saw them out walking with the boys? I thought they all looked so contented and happy, and the boys are such handsome youngsters. They may be poor, Bert, but they've something to show for their time."

Her husband shrugged his shoulders irritably.

"I'll tell you what they have," he said. "They have a small six-roomed house, on a poor street, in need of repairs, five thousand dollars Life Insurance, and that's all they have in the world. His salary just covers expenses—he'll borrow on his insurance again to send the boys to college. He'll skimp and save and work to the end of his days. He'll never take his nose from the grindstone, and she's the same!"

"The boys represent their life work," said Mrs. Wilson persistently. "They haven't got their money in the bank, the way we have; they have it in the boys—the way we haven't. They've worked to better advantage than we have."

"I don't see it," he said, and he went out of the room with every indication of impatience.

One morning at breakfast a few weeks later, Mrs. Wilson said to her husband:—

"Did you notice the school repott this month?"

"No," he answered tartly—"why should I?"

"There's no reason," she said quietly, "and no reason for my noticing it, only that I always do read it. Did you ever have a sore nail, which, someway—you like to hurt? I don't know why,—Well, I read the school report for some such reason as that—and it always hurts."

A long silence fell upon them. What was the use of going over all the arguments again?

Before he left, he said more gently: "What were you going to tell me about the school report?"

"Nothing,"—she answered—"except that the Brown boys are ahead again. John passed his entrance, with honors and Tom is one year behind. Both names are the first on the list."

"That's because 'B' is the second letter in the alphabet, I guess," said Mr. Wilson. "Well, I'm glad you told me—I'll know enough to keep out of Brown's way for a few days."

Maxwell

"Home" Washer

—the washer that not only washes the clothes mechanically, but does it better than they can be washed by hand. There's no "skimping" by the "Home" Washer—light or heavy articles are cleaned with equal thoroughness. There's no tearing of delicate fabrics, either And it does the work in half the time! No more long-drawn-out, backbreaking washdays anywhere there's a Maxwell "Home" Washer; Just put the clothes in, and the rest is hardly work at all—because the "Home" Washer is so light, noiseless, and easy-running. Enclosed gears make it absolutely safe: "springs" make cover lift easily. Made of best quality cypress, handsomely finished. Runs by hand-power or water-motor. See it at your dealer's.

THE LARGEST IN OUR LINE IN CANADA

Live To Old Age in Comfort

Much care is advised to men and women who are just turning forty.

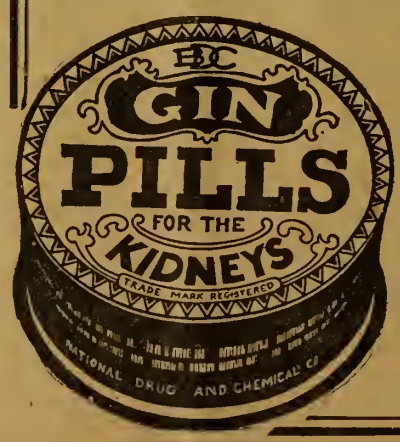
At forty, many ailments that have lain dormant, become active. Kidney and bladder troubles show themselves, and it is only through exercising great care and caution can these dread diseases be overcome.

At the first sign of pain in the back, or across the groins, or when dizziness, constant headaches, swollen joints, rheumatism, sciatica or gravel bring suffering or discomfort take

Gin Pills FOR THE KIDNEYS

Gin Pills, taken in time, will prevent serious complications. They strengthen weakened kidneys, relieve congestion, soothe inflammaton, and help the vital organs to purify the blood so that the poisons, uric acid and waste are duly eliminated.

Gin Pills contain no alcohol. Their great efficacy depends on the valuable principle derived from the Juniper Berry, which, combined with seven other valuable diuretics and antiseptics, result in a pill that is, we believe, the best ever prepared for allaying the pain caused by deranged kidneys.



Get Gin Pills from your druggist or dealer—they are sold for 50c. a box—with a money-back guarantee.

He said it laughingly but his wife's eyes were very listless and weary as she sat leaning her head on her hands.

She was still sitting there, when the maid came to clear away the dishes.

(Continued in the next issue)

THOSE WHO COME BACK

In the months that have passed since the signing of the Armistice Canada has been bringing home those who have survived the war. On the whole her greeting to her sons has had no lack of genuine enthusiasm and warmth, and perhaps spectacular display. Her cities have been almost daily bedecked with flags, her municipalities have been busy with receptios, and her homes have been bright with the light of thanksgiving for the return of the boy who was "over there." Her politicians and preachers, her press and platform, her fraternal societies and her civic and provincial leaders have all joined in a great chorus of welcome. Much has been said and written of Canada's gratitude for her sacrifice; and there has been many asurances that her debt to her soldier offspring Canada will not forget. With the completion of repatriation this great national chorus has at last been silenced and the hands of reception committees have been, perhaps somewhat wearily, folded, for the war is of the past.

But this not to be the end. Canada realizes that this is not the last she has heard of those who have just returned to her fireside. She knows, as a mother knows, that while she cannot forget her beloved dead "over there" she must also be mindful of her living children who have wandered home from the far country and who will help to keep her house in order. Those of her family who remained at home know too, that the men who have returned to them are not quite the same as when they went away; that these home-comers are very different from the men they knew in the pre-war days. Canada is still asking anxious questions about "those who came back" and about the so-called problem of the returned soldier. How have they changed? What will their influence be in the national life? Will they settle down in time to the old pre-war routine? What has their war experience done for them?

In the last five years over half a million Canadians have worn a garb to which they were not accustomed and have performed duties for which they were not previously trained. The strange and unaccustomed khaki is off, and they have turned their energies to more peaceful labors. But they have not put off that wonderful something of the spirit which they donned with their soldier's uniform, and which belonged to it during these anxious days of peril when the world was under arms.

Not alone is it a change of years. Not merely that the lad who went away has come back a man; nor that the man who went has come back with hair perhaps a bit whiter and with face a bit more lined. The difference is indeed a "something of the spirit." It is first and foremost a changed outloog on life. The geographical horizon has been widened. Men have learned that they are "Canadians" rather than dwellers in Toronto or Montreal. Canada means more to them now than when they went away. Before the war one part of Canada knew little of and cared less for how the other part lived, nor did one part consider very unselfishly what the other part thought. East was East and West was West. Life was at best provincial. Men knew other countries, but they did not know their own. It was often the proud and impressive boast of a dweller in the Maritime Provinces that he had "crossed the Atlantic six or eight times, but that he had never been west of St. John, N. B." Ignorance of his own country and knowledge of another was looked upon as a virtue or and evidence of broad culture. The horizons were too frequently those of provinces or even countries or towns and there was little thought or knowledge of the land out yonder. Even in the schools little was heard of the homeland. The boy in Meeting Creek, Alberta, seldom looked even in imagination eastward beyond the prairies or westward beyond the distant hills, and the lad in Guysboro, Nova Scotia, seldom turned his thoughts to a place far removed from the Atlantis mists. The locality where each resided meant to him Canada.

War made strange companions. An effort was made by some provinces to have their provincial units intact at the front and to have them reinforced only by the provinces in which they were originally recruited. Fortunately for the fuure of Canada this plan could not always be carried out. And so it hapened that men from British Columbia, Alberta, Saskatchewan, Manitoba, Ontario, Quebec, New Brunswick, Nova Scotia and Prince Edward Island lived at times in the same billeting area, or even in the same dugout in a shell-swept sector in France and ate bully-beef or "mulligan" served by the same cooks. It was in front of Vimy Ridge that Vancouver Road met Nova Scotia Road and Saskatchewan Road, and continued forward again as Moosejaw Road with New Brunswick Road and Gaspe Road not far away. It was here too that Quebec Trench linked up with Winnipeg Trench. This mingling in a strange and death-infected country of names remote at home was symbolic of the strange mingling and comradeship of the men to whom these names were lear. Sandy MacDonald from Grand Narrows, Cape Breton, went over the top with Pat O'Leary of Toronto on his right, and Pierre LeBlanc of Tadousac on his left, while Ivan Slovaski of Regina, and Percival Chicchester-Jones, who wore a monacle back home in Victoria, B. C., were nearby; and they faced death and won, and proved themselves great, and mopped up the enemy trench together. Or they managed the same howitzer during a counter-attack. In these splendid moments the imaginary lines of races and creeds and provinces was blotted out. These men were conscious only that they were Canadians fighting for the great ideals of their common country. They can never be provincial again. "These men have done much to advertise their native povrince," I heard a speaker say with more enthusiasm than judgment of some returned officers. He was wrong for he was still

When Your Liver Becomes Sluggish

Your Bowels Become Constipated.

Constipation is, without a doubt, the commonest of all the ills that mankind is afflicted with, and one if neglected, will cause no end of trouble and sickness.

The way to keep yourself in good health is to keep the liver active and working properly by the use of Milburn's Laxa-Liver Pills.

Mrs. L. Wainman, Orillia, Ont., writes:—"From a child I was always very badly constipated, and I can well remember, when quite young, my mother giving me senna tea nearly every morning, and I got to dread it.

"After taking Milburn's Laxa-Liver Pills for a while I am not troubled with constipation any more."

Milburn's Laxa-Liver Pills are 25c. a vial at all druggists or dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

MINARD'S "KING OF PAIN" LINIMENT

The old reliable remedy for rheumatism, neuralgia, sore throat and sprains.

Best Liniment Made

MR. A. E. LAUNDRY, EDMONTON, writes:—"I fell from a building and received what the doctor called a very bad sprained ankle, and told me I must not walk on it for three weeks. I got MINARD'S LINIMENT and in six days I was out to work again. I think it the best Liniment made."

Minard's Liniment always gives satisfaction. For any ache or pain. It gives instant relief.

Minard's Liniment Co., Limited

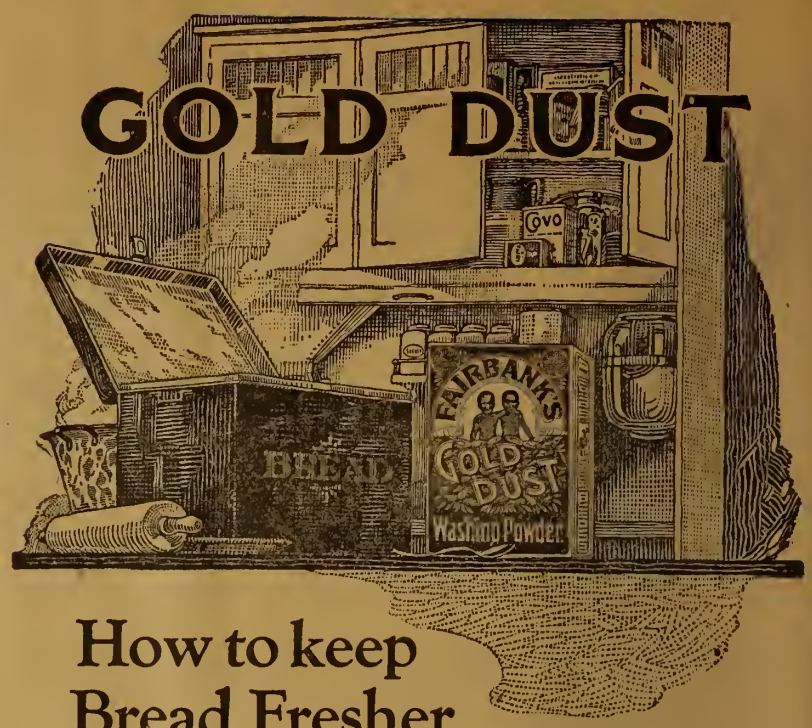
thinking provincially. "Over there" they advertised only Canada, for they were known only as "Canadians."

On those who come back the war has had an eeffct, closely related to the above, on the much talked of, but little understood, question of the French in Canada. "Over there" our boys lived when on rest with the French people and they grew to know and admire them. and to understand their temperament. They saw their suffering and how heroically and cheerfully they bore it all. The majority of them learned a new language. They picked up at least a smattering of French. Little enough this may seem on the surface. But deeper it should mean a greater harmony of races at home. It should mean too, a greater emphasis on French in our schools. For it will mean a determination on the part of our boys not to lose, if possible, the little French they have acquired. It means the realization that in our country there are two tongues, the two great languages of the world, which today give expression to the ideals of freedom; and a knowledge of these two, however small, must mean a greater harmony on the new Canadianism fostered by the war. It must produce in the end a sympathy and an understanding, too often lacking before the war in the relation of race with race.

Those who come back will likewise have greater religious tolerance. Creeds mean less intolerance to them now than when they went away. Even as provincial lines are less distinct, the intolerance of creeds is less emphatic. We have heard much about the "religion of the trenches,"—much that was foolish sentimentalism, little that was of fact. The religion of the trenches was not a new religion; it was as old as Chistianity itself. But it was bereft of the trappings by which in pre-war days it was too frequently obscured. The basis of true religion anywhere is sacrifice and service, unselfishness and humility, justice and courage, fidelity and duty, and the bearing of one another's burdens. It was stated hundreds of years ago, it is as old as history. 'Do justly, love mercy and walk humbly with your God." Bear ye one another's burdens." Quit ye like men, be strong." "Be ye faithful unto death." "He that saveth his life shall lose it." "Greater love hath no man than this, that a man shall lay down his life for his friend." This is surely not a new religion. But in the soft days of peace its principles were well nigh forgotten. The war made it a reality. For "over there" the men lived it daily and nightly. It was not put on merely when they dressed for parade; it was not displayed as it too often is in peace time with their Sunday clothes. It needed no church with storied windows, nor pulpit with gorgeous trappings to expound it. It was not accompanied with cathedral aisles or mysterious altars, by pealing organs or surpliced choirs. It was indeed a "something of the spirit"—the law by which men governed their lives, the law, too, under the power of which they died. In the war zone men were not captivated by frock-coated melodrama or amateur philosophy, but they were silently interested in the things of God. Hypocrisy got short shift in the trenches. Intolerance was not permitted. Both were foreign to religion. The men suffered daily for a cause or gave away their lives for someone's sake, saw one another in their true persepctive; they were stripped of all the petty affections and the unreal gossamer of life. They saw only realities.

And brotherhood was not a dream; it had a real meaning; and the ideal of Jesus "that ye all may be one" was in pat, at least realized. The men who stood waiting, waiting, in the darkness, waiting to go over the top to break the Mindenburg line or to die in the attempt, had little interest in the thin delusions and foolish toys that in times of peace divide heart from heart and make men unmerciful to his brothnr. For the Great Leveller was always near by, and they stood on the brink of that West where there is neither race nor creed. They knew only that they were men from the same great country, bound by common bond, with the same duty and the same objective, on the same great quest, and willing to die for the same Ideal, the Ideal born in a Man-



How to keep Bread Fresher

YOUR bread can't keep "fresh"—even for a day—in a stale bread box.

A tablespoonful of Gold Dust to a gallon of hot water takes wonderful care of Bread Boxes because Gold Dust dissolves every particle of grease in nooks and crannies. Now, scald with hot water and air thoroughly.

With this simple Gold Dust recipe you never need worry about stale or "mouldy" bread boxes.

Busy housekeepers know there is only one Gold Dust. They always look for the Gold Dust Twins on the package.

"We have been using FIVE "ROSES flour and can gain a loaf of bread on every baking." —*Miss H. R., Brougham, Ont.*

"Always go back to FIVE "ROSES, as I have more bread "with same amount of flour."— *Mrs. C. H. McN., Englehart, Ont.*

"I use 7 quarts of FIVE ROSES "flour in my recipe. Other flours "I have used take 9 quarts."— *Miss A. P., Marshville, Ont.*

"Am positive one can get more "bread out of a bag of FIVE "ROSES flour than from any "other kind."—*Mrs. N. H., Copetown, Ont.*

"Always an extra loaf from the "same quantity of flour." —*Mrs. A. M., West Summerland, B.C.*

"The most profitable flour a "poor man can possibly obtain." —*Mrs. T. S. McC., Rodney, Ont.*

SAVE A LOAF
at Every Baking

COMBINED with its great nutrition and enticing eating qualities, FIVE ROSES is the acknowledged flour for *economical* baking.

It actually *saves* flour and the money that that flour costs. This on account of its bigger yield due in turn to its glutinous strength and water-absorbing capacity.

Exactly how much it will save *you* depends upon how much baking you do, and upon how much bread you make at one baking.

Read what thrifty housewives write us, in the margin. It points the way to patriotic economy.

You know how much FIVE ROSES flour you can bake in a year. By saving a loaf at every baking, figure out for yourself how you can reduce your own High Cost of Living.

FIVE ROSES FLOUR
FOR BREADS, CAKES PUDDINGS, PASTRIES,

ger over nineteen hundred years ago, which is the monopoly of no religious faith and which can appeal alike to men of all creeds and of none. And they trusted one another to be "faithful unto death," to "quit like men" honestly, justly and fearlessly.

Again, the Chaplain's creed or church was seldom thought about or considered. The Padre for the most part was a welcome and beloved figure. To the men he was usually a Pilgrim of Love, irrespective of the church to which he belonged. "He went about doing good"—that was his main interest to the soldier. And in hard and dangerous places "he was with them always, even unto the end." His congregation was always one of many sects and creeds, as church doctrine names them. Indeed it could never be classified. The Roman Catholic priest buried the Protestant dead or the Protestant chaplain buried the Roman Catholic dead near where they fell on the field of honor, or he took their last message in the hospital ward. The Anglican rector gave communion to the Presbyterian or the Methodist as he repeated in his temporary dugout or shell-hole or gun-pit, "Whosoever will may come." Men kept their own faith and their own creed, but they had respect for one another's. Religious intolerance had no place in the trenches. It will have no place in the hearts and minds of those who come back.

MAKE PLANS TO STORE AWAY SUPPLY OF ICE THIS WINTER

An ample supply of ice is of greater economic importance in the country home than in the city residence. Folks in the city can buy perishable supplies as needed, but the remoteness of many country homes from markets often makes it necessary to use canned, corned or smoked meats use canned, corned or smoked meat producs all through the seasons of the year when the table should be supplied with fresh meats.

In the country, ice is appreciated not only for its use in the preservation of fresh meats, butter and other table supplies, but it is well nigh invaluable in the production of high grade products.

Ice is a luxury which everywhere can be had almost for the gathering. The cost of harvesting and storing is not to be compared with the comfort that it brings. The cost of packed ice of course, varies in different localities, but on the average the total cost of harvesting, hauling, storing and packing is about $1 a ton.

With the natural advantages of abundant streams, lakes and ponds of clear, pure water and the cold winters there is little excuse for most farm homes not being equipped with facilitise for storing sufficient ice to last through every summer. The harvesting is done at a time of year when the men and teams are not too busy, and after the construction of a suitable ice house, the cost is insignificant.

Source of Supply

The stream or pond from which the ice is taken should be fed from a source free from contamination or pollution. If the stream is so sluggish that water weeds thrive in it, all vegetation must be removed to prevent its freezing in the ice. Decaying vegetation forzen in ice is objectionable because as the ice melts, the refuse is deposited in the ice box or refrigerator, making it dirty and dangerous to health. Ponds in which green spawn grows profusely can be rid of these pests by copper sulphate. The crystals can be placed in a cloth sack, hung to a pole and drained through the water until the salts are dissolved. One or two treatments at the rate of one pound to one hundred thousand gallons of water will keep down such growth and make the water clear and pure.

Cubic Formation Best

To keep well, ice must have a minimum surface exposed to air or to the packing material; it must have thorough insulation to protect it from heat and air; it must have good drainage and it must be packed to prevent as nearly as possible the circulation of air through the mass.

The more nearly the mass of ice approaches the solid cube, both in shape and texture, the easier with good drainage and insulation, will be the keeping problem. Experience has shown that the cube formation is the best. A mass of ice twelve by twelve by twelve exposes less surface than the same tonnage piled in any other form.

Farmers who have only a small quantity of ice to harvest will need only two saws, two ice tongs, two ice hooks and a pointed bar. In co-operating with neighbors to fill community houses, these tools may belong to individuals or the complete outfit might be bought by the community organization. The advisability of cutting square or oblong cakes must be decided by the harvester. Oblong cakes twenty-two by thirty-two inches have the advantage that they can be lapped so as to break joints as they are stored and thus reduce the possibility of air passages in the ice heap.

The function of an ice house is to prevent outside heat from passing into the interior and melting the ice; such passage by interposing in the walls a material which will resist its transfer from the outer to the inner side of the building. The best insulators appear to be those containing the greatest amount of entrapped air confined in the smallest possible spaces. No entrance should be allowed near the ground line as the cold currents of air at the bottom will filter through.

Insulation is Needed

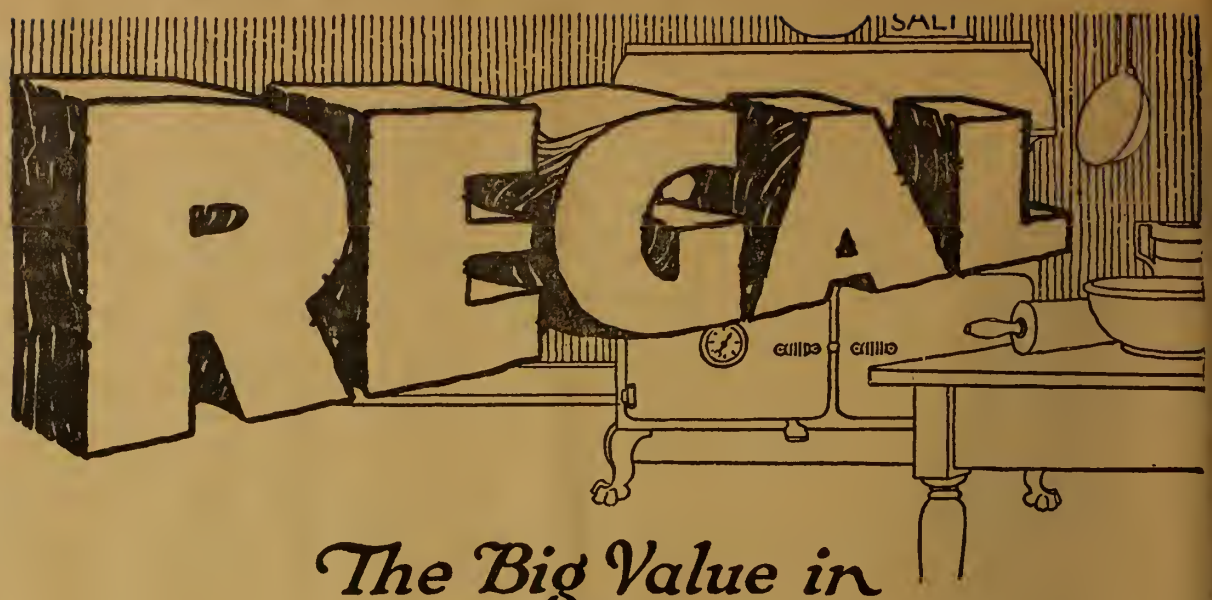
If the foundation and walls are air tight at the bottom, an opening at the top has little effect as, when the warm air enters it will remain at the top of the room. A layer of insulating material should be placed on the floor and the ice stacked on it. There shoul also be a layer between the ice and the walls. Ice should never be stored directly on the ground which is a conductor of heat, especially when wet, as all ice house floors are sure to be. Planing mill shavings are better than sawdust for insulating. They are elastic, they do not settle rapidly and do not absorb moisture and most important, are free from dirt. There are several makes of commercial insulator which are better than either sawdust or shavings and cheaper in the end, but their initial cost is somewhat greater.

Thorough drainage is esstnial. If the floor is below the level of the ground, sufficent drainage usually can be obtained through the soil, especially if the soil is porous. With a clay soil, it may be necessary to excavate a foot or two and fill in with cinders or gravel and to place a three inch porous tile under the floor. This drain should be properly trapped or sealed to prevent warm air from enteing the floor. All floors should slope towards the centre of the floor to prevent the ice from falling against the walls of the building and in houses having water-tight floors, to carry the water to the drain.

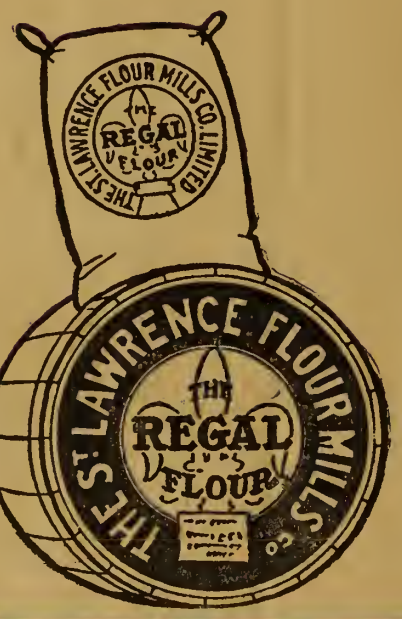
There is bound to be some melting of ice, causing moisture to settle on the walls and ceiling. If the building is of wood, it absorbs the moisture and rot and decay follow, so wooden houses should have a ventilating system that can ve controlled. The ceiling should be sloped to the centre in order to carry the warm moisture laden air to the ventilator. In houses with some form of commercial insulation that will take a cement finish on the interior no ventilation is necessary. The building should be constructed so that there will be a circulation of air through the outer wall and at the eaves to the ventilator on the roof as these air currents tend to break up heat radiation through the walls and roof.

Quantity of Ice Needed

Owing to the different conditions under which ice is handled, the locations of the buildings and the quan



The Big Value in
FLOUR



IN THE KITCHEN, the big event is baking day. And the important thing on baking day is to use "REGAL"—the ideal flour for bread. "REGAL" means bread of uniform texture, lasting freshness and wholesome qualities.

tity packed, there is a wide variation in shrinkage. Generally speaking it wil ltake a ton and half of ice to cool the milk from each cow. From forty to fifty cubic feet of space are needed for a ton of packed ice. About 50 per cent. more ice should be packed than actually is needed. This amount will allow for a heavy shrinkage and for generous household use.

OUR APPLE FUTURE

The apple is king in the Annapolis Valley, and we are now gathering the fag end of the biggest crop we have ever had.

Our orchards have been taxed to the very limit, and our orchardists, will have to put back into their orchards vitality to replace what was used this season, or else the slump in the crop of 1920 will be enormous.

Orchards will have to be liberally fertilized, so as to ensure a vigorous an dhealthy growth, and nature will have to be assisted in the polination of the coming blossom.

The fact has been established that the Bee is our most efficient ally in that respect, and it is up to us to make uuse of all the Bees that can be secured, so that their work in our orchards may result in more fertility and consequently more thoroughly developed apples.

It has been established beyond question, that when the apple blossom is not sufficiently pollinized, the result is a poor dwarfed apple, that does not develop or mature; that is simply a useless incumbrance to the tree that bears, it, and that eventually lets it go in what is usually termed the June drop.

The Dominion Atlantic Railway is working hard to interest our growers in the value of the Bee, is showing films illustrating the matter, and showing them free all over our Valley, in fact in every community no matter how remote from the Railway, asking only that the people shall apply for them. They are also willing to assist the farmer to procure Bees so that it is all up to them, as to whether the present production increased from year to year, or whether we go back and accept just what nature gives us, while we fold our hands and look on.—Advertiser.

CARBONATE OF LIME IN APPLE SYRUP; KEEPING CIDER

Why is powdered calcium carbonate or carbonate of lime used in making apple syrup? What is your idea of keeping apple cider? Is benzoate of soda or salicylic acid, one ounce to the barrel, 4 to 0 gal., advisable?5—W.M.

Carbonate of lime is added to the apple juice and the precipitate removed to reduce the acidity. It is a harmless addition, for, even if you get in too much, it is so insoluble that it is all filtered or strained out later, and you have a better syrup as a result.

Opinions differ as to the use of the preservatives you mention. We do not think they should be used if the cider is to be offered for sale, unless the fact is clearly stated to the buyer and even then there may be some local health regulation against it. But we are unable to share the prejudice against the preservatives when used in small amounts in cider or similar fruit juices for domestic use. The quantities which you quote are quite small, in fact rather too small to be much good unless the cider is very fresh indeed, and even if you doubled them you would not get as much of either acid in an ordinary drink of cider as you would if you ate a dish of cranberry sauce or chewed a few wintergreen leaves. It would be quite another matter if cider so preserved made up a large and regular portion of your daily diet. After all, the one sure preservative is heat, but the flavor of apple juice is so delicate that it is some what the worse for sterilization.

"Making two blades grow where only one grew before."

1920 Fertilizer production will be an uncertain proposition

"Shur-Gain Fertilizer buyers should order a full supply at once and arrange for deliveries in January or February at latest. Strikes at the phosphate mines, railway car shortages and soft coal strikes have delayed raw material shipments to us and will affect the consumer too.

THE REASONS FOR A FORWARD MOVEMENT

FIVE Christian Communions in Canada are engaged in a Forward Movement. They call their various constituencies, and the people at large to a livelier and more sacrificial Christianity. They are making a great financial appeal. It is fitting that the public should know the reasons.

THE DECLINE OF THE DOLLAR

The sharp rise in prices the world over has affected seriously the position of all men working for a fixed salary. Missionaries are in this category. Stipends that were ample in 1900, and nearly adequate in 1912, are utterly insufficient in 1920. There has been no general increase in these stipends. There cannot be, until the Canadian people scale-up their giving in accordance with the decline in purchasing-power of the Canadian dollar.

NEW STANDARDS FOR ALL

The Anglican Synods, the Baptist Conventions, the Congregational Union, the Methodist Conferences, and the Presbyterian General Assembly, have set new standards for the salaries of Clergymen actively engaged in Canada. But, for the Missionaries and for the Superannuated Ministers, no increases have been possible. One of the aims of the Forward Movement is to show the impossibility of maintaining missions, even on a pre-War basis, without greatly increased revenues.

THE CALL FROM ABROAD

Despite this financial difficulty, new opportunities for the extension of Christian teaching have appeared. In India, literally millions of "outcastes" are pleading for Missionary preachers and doctors. In China Missionary teachers are required to help formulate the National system of education. Hospitals, Missionary nurses, doctors and dentists, are heartily welcomed by the people. From other lands comes the same story.

THE HOME RESPONSIBILITY

Here in Canada the rapid growth of our cities, the expansion of the West, the great immigration of the last twenty years, and the depopulation of rural areas, make a four-fold problem.

Finally, the decline of the dollar has created difficulties in financing the various Colleges established and maintained for the training of the Clergy. The men of faith doing mssionary work abroad are the product of these Colleges. The Church must continue them in action.

IN UNITY OF FAITH AND PRAYER

These are the facts. Faced with such conditions, the Church leaders, at first, were appalled. Putting aside for the time being differences of religious temperament, considering only their common belief in the Everlasting Father, the Almghty Son, and the everpresent Holy Ghost, they prayed together. Then they arose, thrilled with a glimpse of the wonderful Missionary opportunity, to appeal together to the whole body of Christians in Canada.

THE GREATEST OF ALL GIFTS

You are a believer in the Lord Jesus Christ, and in the Gospel He proclaimed. Your country has become great through Christianity. The hope and love of the Gospel have warmed your heart and illumined your life.

You will be asked by the representatives of your Church to show practical proof of your convictions. Be prepared—not to give a trifle out of your abundance, but to taste the full sweetness of Sacrifice.

"For God so loved the world, that He gave His only begotten Son, that whosoever believeth on Him should not perish, but have everlasting life."

The United National Campaign

Representing the Simultaneous but Independent Forward Movements of the Anglican, Baptist, Congregational, Methodist and Presbyterian Communions in Canada.

Lawndale Stock Farm

Jerseys and Shorthorns (Pure Bred)

Jersey Offerings for the Winter of 1919—20

A few registered mature cows due to freshen the coming fall and winter.

Yarmouth North, - Nova Scotia

COSSAR STOCK FARM

Lower Gagetown, N. B.

Importers and breeders, Clydesdales, Dairy Shorthorns and Border Leicester Sheep

Orders now booked for EWE and RAM LAMBS for fall delivery, several extra good animals for sale out of Ewes clipping 10 to 12 lbs. and sired by an Imported Ram weighing about 400 lbs. with a clip of 18 lbs.

BREED LEICESTERS the Sheep with THE HEAVY FLEECE.

G. C. Cossar, Proprietor. J. Meiklejohn, Agent.

Elmwood Stock Farm

OFFERS FOR SALE:

Two choice young Holstein Bulls, 15 and 19 months old, sired by Dutchland Pieterje Count, whose four nearest dams have records averaging 28.61 lbs. in 7 days, a grandson of Colantha Johanna Lad, "the world's greatest bull," 101 A.R.O. daughters, 4 over 32 lbs. and 7 over 30 lbs. Three of them world's records for 365 days.

W. L. ETTER, - Shubenacadie, N. S.

Pure Bred Shorthorns For Sale !

Am offering for sale my herd of pure bred registered Shorthorn cattle. These cattle range in age from 7 years to 3 years, or a little less, with one bull calf two weeks old, and are all fine in type and color.

I have also exceptionally good grade cattle of various ages for sale. All will be sold at a reasonable price and offer an unusual opportunity to anyone desiring to start a herd of choice stock or to renew an old herd.

J. E. HETHERINGTON, - Codys, N. B.

Dispersion Sale of Pure Bred Ayrshires

Having sold my farm and offered my entire herd of pure bred Ayrshires for sale, I still have eleven head left, among the lot my stock bull Silver Nugget, just turned two years old. He is a grandson of the famous Ayrshire cow Gardrum Bonnie Jean, whose official record in one year was 14,141 lbs. of milk and 552 lbs. butter fat. The following year she gave over 15,000 lbs. of milk. The sire of this bull was sold to the Experimental Farms at Ottawa for $500.00. This bull is the equal of his sire in every respect. Also Eastcourt Dora, a cow that has an unbeaten show ring record and was third in the 1914 Dairy test at the Winter Fair, and a half sister of the Ayrshire Cow at the Agricultural College, that won over all breeds in 1919, bred to calve for the fall fairs. Among the lot are several two year olds which were sired by Gardrum Gold Boy, the bull sold to Central Experimental Farms, Ottawa. There are also a few yearlings and calves sired by Lotus Perfection, a grandson of Jean Armour. Will be glad to meet any intending purchasers at Truro Station.

GEORGE RITSON,
Upper Brookside.

N. B. The farm is about three miles from Truro Station.

BULL'S CREEK FARM

R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a heifer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. Inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

Phone or write,

Holstein Herd Averages 18812 lbs. Milk

A herd of 13 purebred Holsteins last year averaged 18812 lbs. milk and 638.57 lbs. fat.

Do you realize the money there is in such cows? It is estimated that the average annual yield of all cows in this country is under 4,000 lbs. These 13 cows produce as much milk as 62 cows of the 4,000-lb. class.

Why feed, milk and shelter any more cows than you need to produce the milk you require? If interested in

HOLSTEIN CATTLE

send for booklets—they contain much valuable information.

Northern Electric

POWER AND LIGHT

The Name Behind Canada's Greatest Electric Farm Plant

YOU can link the name Northern Electric with the id[illegible] power and light plant for your farm as Canada's electrical engineers link it when specifying the Nation's telephones.

First in the electric farm plant field is the North[illegible] Electric name. The experience gained through years of successful electrica[illegible] nufacturing is your personal safeguard for the lasting and steady dependab[illegible]y of

Northern Electric
POWER and LIGHT

The unit plant is simple in construction and of efficient design. It has no belts or pulleys. It is self-cranking; self-stopping; and its oversize Titan battery assures ever-ready current for both power and light needs. It is truly the leader for Canadian farms. We also have a belt-driven plant for use with ordinary farm engine, for those who desire this type of plant.

Your farm has need of time-saving, money-making, labor-saving electricity. Hundreds of Canadian farmers could tell you what it has done for them and their farms.

From coast to coast there are Northern Electric distributing houses—the one nearest you is always at your service. There, in stock, is the plant for your farm and everything electrical required for its installation. Make your whole plant Northern Electric—we willingly assume the responsibility for its perfect service.

If you now have electricity, either from Central Station or a private plant, buy Northern Electric appliances. We can supply your every electrical want.

We have prepared some interesting Power and Light literature.
May we send it to you? Fill out the coupon now.

"Go Teach All Nations Beginning at Jerusalem"

"THAT'S it," says a critic, "'beginning at Jerusalem!' You should correct paganism at home before going abroad to look for it. I do not believe in Foreign Missions."

And yet Jerusalem was not Christianized when the Apostles went to Antioch; when Philip taught the Ethiopian.

A Word of Reminder

The man who does not believe in Foreign Missions stands today clothed and educated because of Foreign Missions. When did English culture begin? With the visit of St. Augustine, a Foreign Missionary from Rome! Who evangelized Rome? A Foreign Missionary named Paul, of Tarsus and Jerusalem. What if he had gone to the Ganges instead of to the Tiber!

Certainly Canada needs more Christianity, but the necessity of the world cannot be overlooked while we are busy improving our own spiritual life.

The Mission Established

Five Christian Communions in Canada, Anglican, Baptist, Congregational, Methodist and Presbyterian, have an extensive mission work abroad. They have sent overseas many devoted men and women. By their work, barriers have been broken down and in every land there is an eager call for more missions, more teachers, more doctors, more hospitals. Now, owing to the declining value of the dollars in all lands, it is necessary to double the expenditure in order even to hold the ground won. Until that is done, not one item of an advanced Missionary programme can be undertaken.

The Great Opportunity

All men, who think honestly, realize that the Gospel of Christ is unique in splendor, in majesty, in civilizing influence. It has made the modern world of thought, of industry, of progress. It must go out over all the earth to ease international relationships, to put an end to the cruelty and misery existing in the dark places of the earth. There is free entry for the Gospel in every nation under Heaven. Lift up your heads, O ye Gates of India, and be ye lifted up, ye everlasting Doors of China and Japan and Africa, and the King of Glory shall come in.

The Call to Action

Canadians, Churchmen or non-Churchmen, you met the charges of the war with cheerfulness, since it was waged to establish righteousness in the earth. Can you neglect the call of the Church for adequate means to continue by peaceful suasion the work which for four years was done by batteries and bayonets? Your Church appeals directly to you, civilized and educated by Foreign Missions of an ancient time, to meet your obligation to that same Great Cause today.

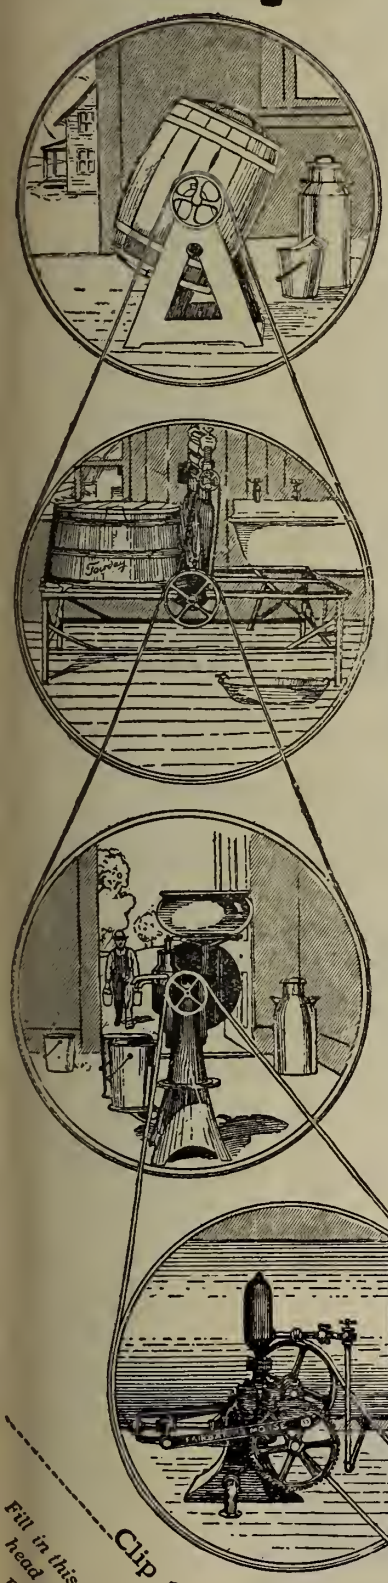
If You Want Greater Comfort, Efficiency, *and* Economy,
Install a Fairbanks-Morse "F" Power and Light Plant



Thousands of rural dwellers in Canada have discarded the old messy and dangerous oil lamps for Electric Lighting Systems.

BETTER light by merely pushing a button—and an end to cleaning and filling lamps and lanterns—are advantages which appeal to every rural family. But the "F" Power and Light Plant does more than light the house, outbuildings, yard, etc. It does away with much of the drudgery of wash-day. The "Z" engine will run the washing machine and supply current for an electric iron. House-cleaning becomes much less irksome when you can avoid the dust and labor of sweeping by using a vacuum cleaner which operates from the "F" Power and Light Plant. Toast and coffee can be made at the table with an electric toaster and percolator, saving many steps and much waiting.

Water wherever you want it, and when you want it let the "Z" engine do the pumping. No more turning the cream separator or the churn—the "Z" engine will furnish power all day for a few cents.

When the "F" Power and Light Plant is installed, you will find it the biggest help you have on the farm, and also the best value, even at its low price, of any power and light plant on the market.

You owe it to yourself to investigate the "F" plant and see its advantages demonstrated; to learn the comfort and convenience it makes possible; to learn how it saves labor and money enough to pay for itself.

Send the coupon in the right corner to our nearest branch and we will give you full particulars and tell you where you can see an "F" plant in operation.

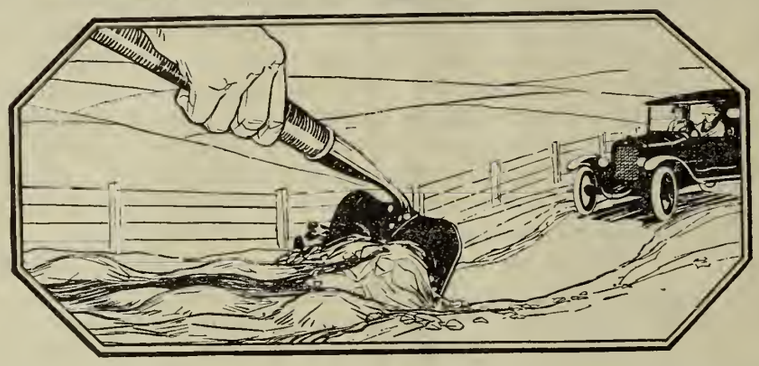
Overland

TRADE MARK REG.



Like Riding On Roads With The Bumps Scraped Off

THERE is only one way to enjoy the greater comfort introduced by the new Overland 4—

And that is by riding in this car with its 130-inch **Springbase!**

Gone is the usual bouncing, swaying and jolting. Instead, due to the three-point suspension **Triplex** Springs there is more of a **smooth gliding** sensation.

The passengers are not only free from ordinary road-blows, but the car itself is shielded, prolonging its life and reducing upkeep.

The light weight of this new Overland 4 means economy of fuel and tires.

And it is fine looking, and luxuriously cushioned; it is fully equipped from Electric Starting and Lighting to Electric Horn. Let the Overland dealer show you why the three-point suspension **Triplex** Springs give heavy car comfort and road steadiness to a light car for the first time.

Tuberculosis in Live Stock

Detection, Control and Eradication

By John A. Kiernan, Chief of Tuberculosis Eradication Division and Alex. E. Wright, Assistant Chief, Washington, D.C.

HOW TUBERCULOSIS SPREADS FROM A DISEASED HERD TO A HEALTHY ONE

Tuberculosis may be intorduced into a healthy herd by any of the following means:

By the addition of an animal that is affected with the disease; therefore animals should be purchased only from herds known to be free from tuberculosis, or from herds under supervision for the eradication of the disease.

By feeding calves with milk or other dairy products from tuberculous cows; this frequently occurs where the owner purchases mixed skim milk from the creamery, and feeds it to his calves without first making it safe by boiling or pasteurization.

By showing cattle at fairs and exhibitions; reports have indicated that numerous herds have become infected through mingling with infected cattle at shows or by occupying infected premises.

The shipment of animals in cars which have recently carried diseased cattle and which have not been disinfected properly.

Community pastures; pastures in which tuberculous cattle are allowed to graze are a source of danger.

In most cases the outward appearance of the animal bears no relation to the degree of infection. The disease frequently develops so slowly that in some cases it may be months or even longer before any symptoms are shown; therefore he on the safe side and have your herd tested.

(Continued from last issue)

The Intradermal Test (Into the Skin)

The intradermal test for detecting tuberculosis is used to a considerable extent, especially on range cattle not easily controlled. When made by those who have become skilled in its application, it is very accurate. In this test the tuberculin is injected between the layers of the skin, only a few drops being used, and it is usually applied in the region at the base of the tail, where the skin is soft and nearly hairless. The intradermal test is satisfactory also for the diagnosis of tuberculosis in swine and, when so used, the tuberculin is applied into the skin of the ear near its base.

The reaction from the intradermal test consists of a swelling at the point of injection and is observed from 48 to 108 hours after the injection. The character of the swelling varies, and a proper diagnosis of tuberculosis by this test can be made only by an experienced person.

The Ophthalmic Test (Into the Eye).

Still another method, known as the ophthalmic, is used to some extent and has been found to be of considerable value in what is known as "check" testing; that is, it is used in connection with either of the previously described methods. Sometimes a tuberculous animal that fails to react to those tests shows evidence of the disease upon the application of the ophthalmic test. The ophthalmic tuberculin is placed in one eye and the other eye is used as a check. A reaction is indicated by a characteristic discharge from the eye receiving the treatment, which may occur in from 3 to 10 hours after the application or even later. Some swelling and inflammation of the eye and lids are often noted.

Post-Mortem Appearances.

Animals affected with tuberculosis may show the effects of the disease in almost any part of the body. In advanced cases the lesions are easily found, but when the disease is of recent origin or if a slightly diseased area has been encapsulated or closed up, it is often very difficult to find evidence of the disease. Lesions in advanced cases generally appear as nodules or lumps, which are tubercles formed as a result of the disease. These lumps may be found in great numbers in the lungs and abdominal organs. The lesions are of various sizes and may contain pus, either soft or hard; many times it is gritty. Tubercles are often found in various numbers attached to the walls of the thoracic and abdominal cavities. Lesions of the disease also occur in the lungs, liver, and spleen. The lymph glands, to some extent, are usually affected, and, when cut into, show diseased areas characteristic of tuberculosis.

Lesions of the disease may be found also in the skin and in or on the bones. In animals only slightly diseased, the lesion may be hidden so that it is impossible for even the most skillful person in the post-mortem work to find it. A microscopic examination of the lymphatic glands or other tissues often reveals the presence of tubercle bacilli when no lesions can be seen by the naked eye, a condition showing that the disease is just starting. When animals have reacted to the tuberculin test, a very careful post-mortem examination should be made. The action of tuberculin is often discredited when on post-mortem the lesions are not plainly seen, but experience of many years has shown that very few animals reacting to the test were not affected with tuberculosis to some extent even though some were very slight.

Methods of Eradication

Cattle owners who do not know whether tuberculosis exists among their animals should ascertain the fact by having them tuberculin-tested and physically examined by a qualified veterinarian. In many cases thousands of dollars and very valuable breeding animals might have been saved by taking up tuberculosis-eradication work in time. Three main projects comprise the general campaign of eradication, as follows:

1. Eradication of tuberculosis from pure-bred herds of cattle.

2. Eradication of tuberculosis from circumscribed areas.

3. Eradication of tuberculosis from swine.

It is important to eradicate tuberculosis from pure-bred herds of cattle at the earliest possible date because the spread of the disease is greater among such animals than among grade cattle. The reason is plain; pure-bred animals are shipped extensively to every part of the United States for breeding purposes. A pure-bred bull or cow may be shipped from Maine to Texas, or from the State of Washington to Florida. If it is diseased and is introduced into a healthy herd, it not only fails to fulfill the purpose for which it was intended—the upbreeding of the herd—but it actually causes heavy damage by spreading the disease to healthy animals.

Accredited-Herd or Honor-Roll Plan.

The breeders of pure-bred registered cattle fully appreciated the above-mentioned fact when, together with the live-stock sanitary officials of practically all the tSates, they adopted what is known as the accredited-herd plan, the principles of which are that herds found to be free from tuberculosis on two successive annual tests are placed on the Honor Roll, and a certificate is given to the owner by the State and the Federal Government. The certificate entitles animals of that herd to be shipped interstate without further tuberculin testing for a period of one year. This plan is becoming well known to breeders throughout the United States. The progress of the accredited-herd plan is given in Table 2.

The methods of eradicating tuberculosis from grade herds are, of course, the same as for pure breds. No owner can rest assured that his herd is free from tuberculosis unless it has been properly tuberculin tested. To make a satisfactory test all the cattle should be in normal condition and, so far as practicable, the cattle should be stabled under usual conditions and among usual surroundings. Feeding and watering should be conducted in the customary manner, with the exception that feed and water should be given only after the temperature has been taken. Careful physical examination of each animal should be made before or during the application of the test. If animals react to the test they must be separated from the rest of the herd.

Eradication From Areas

The unit territory to be worked will depend mainly upon the extent to which the disease has spread. In some States practically every county contains numerous tuberculous herds, so that, to control the disease effectively, all the herds must be tuberculin tested. In other States, however, the disease is confined to the beef and dairy herds recently established or to which new animals have lately been added. In the latter case it would not be necessary to test all the cattle, but the examination of the herds should be sufficient to demonstrate most satisfactorily that no diseased herds are overlooked. This can be done by testing several herds in each section of the county wherever there is a suspicion that the disease may exist.

As a general plan, it is best to take up the work by counties, and substantial cooperation should be obtained from the county government. Each county should pay (1) part of the expense of exterminating the disease by employing inspectors to make the tests, (2) part of the indemnities paid for tuberculous animals, and (3) its share of the cost of cleaning and disinfecting infected barns, stables, and sheds. When a large percentage of the herds of a county are diseased, it is advisable to clean up the herds within a township or possibly one-third or one-half of the area. The progress depends upon the degree of infection found and the cooperation furnished by the owners.

In 1910 the Bureau of Animal Industry took up the eradication of tuberculosis from the herds in the District of Columbia, which has an area of 60 square miles. At that time 1,701 cattle were found. Every animal was tuberculin tested; of the total number,

321 cattle, of 18.87 per cent, were tuberculous. The reactors were removed from the herds and, in most instances, were slaughtered. The infected barns, sheds, and premises were cleaned and disinfected.

Each year since the inauguration of the campaign all the cattle have been tuberculin tested with the result that the infection has almost disappeared.

There are States in which tuberculosis exists to less than 1 per cent among all the bovine population. The plan of carrying on eradication in several counties at the same time in those States is practicable and is being conducted in a number of States.

Before undertaking the work in any area, large or small, the cattle owners should be consulted, and unless they are willing to lend their earnest cooperation and know the sacrifice they may have to make, it is inadvisable to start. The better the organization and the more nearly perfect the plans are made, the more efficiently the work should progress.

The larger herds, especially around cities and those supplying milk locally and for shipment to other cities, should be tested before the small lots. If it is known that the herds are but slightly infected, the intradermal method should be employed, as faster progress can be made with it than with the subcutaneous test. If reactors are found in using the intradermal test, the entire herd should be tested subcutaneously within a short time. The ophthalmic test may also be used in conjunction with the subcutaneous in "check" testing herds. General experience shows that it is sound practice, if there is any doubt, to use all three methods of testing with tuberculin. Such a policy is especially applicable to cattle which have been tested frequently, and among herds which are or have been extensively diseased.

Eradication from Swine

With the gradual elimination of tuberculosis from cattle, the disease among swine will grow correspondingly smaller. It is not necessary to tuberculin test all the swine herds because, with the exception of valuable breeding animals, it is more economical to slaughter the diseased ones when fat than to undertake to exterminate the disease in any other way.

In the case of suspected, valuable pure-bred swine, their freedom from tuberculosis can be determined definitely by the intradermal method, which is practicable and reliable.

The injection is near the base of the left ear; the other ear acts as a check for comparison. A reaction is manifested by a swelling in the region where the tuberculin was injected. The swelling may appear any time from the 24th to the 104th hour after injection and will remain for several days. As in the case of cattle, diseased swine should be removed from the farm, and the sheds, farrowing houses and the lots should be thoroughly cleaned and disinfected.

Measures of Prevention

Since, after many years of study and experience, no satisfactory cure for tuberculosis among animals has been found, prevention of the disease is extremely important. State and Federal Governments have made vigorous efforts to stop the spread of the disease by regulating the movements of cattle, and recently, with that object in view, action has been taken in some localities to regulate the movement of cattle from one county to another. Regulation of intercounty movement should be encouraged because it brings the matter nearer home to the live-stock owner. It is he who must take a very important part all through the campaign of tuberculosis eradication, and if he is in favor of measures to prevent the spread of the disease and faithfully abides by those measures, eradication will be accomplished more speedily.

From what has been said already about the dangers of shipping diseased cattle, it is plain that the movement of tuberculous cattle, except for immediate slaughter or to quarantine, must be stopped whenever possible. After diseased animals are found and removed from the premises, a very thorough cleaning and washing of the inside of the barn and other buildings where the animals have been should be made. This must be followed by the proper application of some approved disinfectant. The use of disinfectants without first doing the necessary and proper cleaning is ineffective for the reason that the germs of the disease must be exposed. All utensils or anything else that may have become contaminated by use around the diseased animals should likewise be cleaned and disinfected. The manure and refuse must be hauled from barnyards or lots to plowed fields, spread thin, and exposed to the sunlight. The yards and lots, including feed troughs, water troughs, and fences can then be sprayed properly with the disinfectant.

All this means much work but it must be done to prevent infection from spreading to the healthy animals. Proper sanitary conditions on premises where live stock are keut is of great importance in keeping the animals healthy and able to resist disease. Sanitation, in its broad sense, includes the admission of abundant sunlight and fresh air properly regulated.

Disposal of Reactors

The disposal of reactors depends largely upon the State laws and live-stock regulations of the State in which the herd belongs. If the animals are pure bred and registered and of unusual merit, they should be segregated, preferably on farms set aside by the State or by the pure-bred cattle associations, for the purpose of retaining tuberculous cattle in quarantine. If the condemned animals are grade cattle, or pure breds not specially valuable for breeding, it will probably be more economical to have them slaughtered than to hold them in quarantine. Of course the fact is recognized that in States and communities where tuberculosis exists extensively the slaughtering of all reactors is impracticable. In such instances the infection can be reduced on all the farms by keeping the tuberculous animals separate from the healthy ones. The tuberculous cattle are kept under quarantine restrictions until no longer profitable; meanwhile the healthy animals are safe from the danger of infection.

Retesting

It is rather uncommon for tuberculosis to be eradicated from an infected herd after one tuberculin test. After the removal of reactors the herd should be retested at the expiration of six months, and a second retest may be advisable six months later, but the practice of testing herds more frequently than that is not usually advised. After two or three semiannual tests the herd should not be tested oftener than every 12 months. While the subcutaneous test is considered preferable for gentle cattle, the ophthalmic and intradermal methods of testing may be employed to advantage as adjuncts to it; and it is believed that in some instances herds may be freed of tuberculosis earlier by the judicious use of all three methods. No general outline can be given as to when all three tests should be employed; the matter should be left to the judgment of the veterinarian under whose direction the work is carried on.

TABLE 2.—Status of cooperative tuberculosis-eradication work, including all herds under supervision, April 1, 1919.

Marking Animals for Identification.

It is very important to mark properly all cattle which react to the tuberculin test, so that they may be easily identified as affected with tuberculosis. One method that is quite generally used is that of branding; a letter "T" about 2 inches high is branded on the lower jaw, or sometimes it is placed on other parts of the body where it can be seen readily. In addition to the branding it is advisable to tag the reacting animals so that one may be identified from another, and in that way the results of the post-mortem examination can be connected up with the reporting of the tuberculin tests. The tag is usually placed in the ear of the animal and contains a seriol number as well as the word "Reactor."

Another method that is sometimes used is the punching of a letter "T" out of the ear, and it has been quite satisfactory.

The marking of cattle that have passed the tuberculin test is a matter that is being handled in different ways throughout the United States, and it is believed that the present methods of marking will be improved. In some cases a metal ear tag is used and in others certain marks of identification are tattooed in the ear. Tattooing has an advantage over the tagging in that it is less expensive and probably more permanent.

It is not often necessary to require special marks on pure-bred registered cattle, as the owner usually has a method of identification, and this method of marking can be used in connection with the tuberculin test as a record; but on grade animals it is desirable to use some system of marking that will show that the cattle have been tested and found apparently free from tuberculosis.

A system of marking swine so that the origin of those found to be tuberculosis on post-mortem examination can be learned would be very desirable, and some experimental work along this line is now being conducted by the bureau in cooperation with owners and packers. The results so far obtained indicate that the tattooing of a number or some mark of identification into the skin of the hog is the most practicable method but of course it entails additional labor and expense which would amount to a great deal if carried on throughout the country. It is hoped a more practicable and economical means of marking swine for identification will be developed in the future, as much good in the campaign for the eradication of tuberculosis in live stock can be accomplished in that way.

Many shipments which contain tuberculous swine are traced back to the farm by a system of reports kept by the Bureau of Animal Industry. By developing the methods of tracing tuberculous cattle and swine from the abattoir back to the farm where they were raised, efforts can be directed in eradicating the disease from these herds.

Appraisement and Indemnity

In addition to the various benefits derived from eradicating tuberculosis, provision for the appraisement of diseased cattle with indemnity for those slaughtered is a further incentive. Federal legislation and supplementary laws in numerous States now divide the burden of loss, so that the Government, the State, and the owner of the cattle all bear a share of it. Briefly, the Federal law provides that the Secretary of Agriculture may reimburse partly owners of animals destroyed on account of tuberculosis in cooperation with States, counties, and municipalities. The bases upon which Federal indemnities are paid are:

1. No payment shall exceed one-third of the difference between the appraised value of such animal and the salvage value.

2. No payment shall exceed the amount paid or to be paid by the State, county, or municipality.

3. In no case shall any payment be more than $25 for any grade animal or more than $50 for any pure-bred animal.

4. No payment shall be made unless the owner has complied with all lawful quarantine regulations.

Legislation regarding indemnities for tuberculous cattle varies somewhat in different States and, for detailed and current information on the subject, the reader is referred to his State live-stock sanitary officials or to the inspector in charge representing the Bureau of Animal Industry in cooperative tuberculosis-eradication work. The names and addresses of these officials may be obtained by addressing the Bureau of Animal Industry, U. S. Department of Agriculture.

N.S. Fruit Growers in Annual Convention

The Fifty-Six Annual Convention of the Fruit Growers' Association of Nova Scotia, held in Kentville, N. S., opened on Tuesday evening, January 20th, V. B. Leonard, Centre Clarence occupying the chair.

The mecting opened with prayer by the President, Mr. H. S. Shaw, invoking God's blessing on all the deliberations of the organization while in Convention.

Mr. Leonard then called for the President's address, which was given as follows:

President's Address

Members of the Nova Scotia Fruit Growers' Association:
Ladies and Gentlemen:—

It gives me very great pleasure to welcome you all to this the Fifty-sixth (56th) Annual Meeting of this Association. Your executive is not surprised to see so many present on this occasion, as these meetings are increasing in interest and importance with each passing year. This association has become the recognised clearing-house for the latest results of the many experiments being conducted at the various experimental fruit stations located in our valley, as well as the annual meeting point for all the more progressive fruit growers who come to compare notes on the year's successes and failures. Your executive has done their utmost to make this season of the Association one of the best in its history, and will shortly invite your most serious attention to the program which has been prepared for this meeting.

The year has been a most unusual one—one in which the fruit grower has been called upon to undergo trials peculiar to his occupation. The month of April began the season with frosts so severe that many feared that the prospective fruit crop had been totally destroyed; but blossom time brought to us again orchards a perfect mass of bloom, and all soon realized that we were face to face with a record crop.

But just when our hopes were highest, a severe outbreak of scab made its appearance in even the best kept orchards, causing the usual damage to fruit and leaf. To add to our troubles the barrel situation early took on a serious aspect, as insufficient preparation had been made for a record crop. Heroic efforts were made by both manufacturers and dealers to supply this deficiency, but in spite of their best attempts, serious loss as well as much inconvenience was caused the grower as we all too well remember.

Then help was both scarce, inexperienced and expensive, cars in sufficient numbers to supply the more distant markets were impossible to obtain, while S.S. freight rates were excessively high. As a final climax to our troubles, there came the severe frost of October 20th when some 300,000 barrels apples were still on the trees. Truly the season of 1919 was one of trial for the fruit grower and will not soon be forgotten.

From this hasty review of the season's operations I must pass to a consideration of the lessons which the year has endeavored to teach us.

In the first place we have been reminded again of the prime necessity of thorough spraying every year no matter how favorable the year may be for the production of clean fruit. The process of spraying is so disagreeable. The rush of work at the proper time for spraying is so great that the most of us are only too ready to grasp any reasonable excuse to avoid it. The previous year's experience had shown that the first spray was not necessary in the production of clean fruit, so that many jumped to the conclusion that it could be safely omitted in most years. Then the power sprayers in the country seemed to have entered into a general conspiracy to break down at the very time when spraying was most needed, with the result that other sprays were also in too many cases omitted. We are safe in saying that many thousands of dollars are annually lost to the country because orchardists do not pay strict attention to the spray calendar which is annually sent them by the department. In order to insure clean fruit every year we must spray thoroughly even when the weather conditions do not seem to demand it. There is good reason for believing that the lesson of the year is being taken to heart by a large number of our growers.

Then again the season emphased the great value of orchard property. During the war, owing to the urgent demand for food from the starving millions of Europe, fruit growers turned their attention more largely than they had ever been doing, to the production of food stuffs. The splendid prices which rewarded these efforts, as well as the small crop of fruit which wartime brought us, led very many of our growers to depreciate their orchard holdings and ultimately to neglect them; but the phenominally high prices which many growers last year received, after the apple embargo had been lifted, together with the record crop of this year, has called attention anew to the great value of our orchards. Dr. Cumming has truly said that the orchards are the chief asset of the valley.

In regard to location we have all that can be desired; then we have the orchards which with only ordinary care produce large crops; there is also an increasing demand for fruit. Furthermore, we have a short rail haul to the seaboard, which, when reasonable freight rates are again established, can land our fruit in the best markets of the world at a good profit to the grower. Then again our strongest competitor Ontario, has in the words of Prof. Crow, during the last four years, dropped back in orcharding twenty years. Quebec lost two years ago, as a result of the severe winter, almost half of her fruit trees, while British Columbia has a handicap of 3000 miles of a rail haul to contend with in reaching the markets of Great Britain.

It would seem then that the Nova Scotia orchardist has every reason to place a very high value on his orchard holdings.

The season has also witnessed a wonderful increase of interest in the co-operative movement. This has been noticed not so much in the number of new societies organized as in the increase of membership in societies already in existence. Owing very largely to the heavy losses which growers sustained last year through selling out early to spectators, together with the many disadvantages which the independent shipper experiences in these days to market his fruit there has been an unprecedented rush towards the co-operative societies. It has become more apaprent each year that the day of the successful independent shipper is over, for the large buyers who come to us since the organization of the Fruit Companies and who as a rule are our best class of customers, will only go where he can get quantity as well as quality. Then again the transportation companies will pay little attention to the small shipper. Government assistance is only obtained in response to the demands of the well organized. In fact the independent shipper meets nowadays with so little encouragement in his effort to market his own fruit that he sooner or later acknowledges this fact and joins the nearest co-operative association.

It is a very happy augury of the times that there is a much more amicable relationship existing between co-operators and speculators. There should be the best of feeling existing between the two classes, for the speculator represents an organization which has accomplished much for fruit growing in the days that have gone. Not all the hard things which have been said about the dealer are true; when he has acquired wealth it has generally been the reward of industry business sagacity and a willingness to assume risk which the ordinary man will not and dare not assume. It is no secret I suppose that there exists today in this valley a strong affiliation between speculator and co-operator which has already secured for our growers important privileges which they could not have obtained in any other way.

But I must now pass to a brief consideration of some of the more important problems which now more than at any other time in our history confront the fruit grower. In addition to our home and foreign markets as an outlet for apple production, there have sprung up among us of late quite a number of evaporating and canning factories, which number is bound to increase as the years go by. Now these factories are already relieving to a great degree far more than we have begun to realize the pressure on other apple markets. One canning factory at Kingston has alone absorbed this year over 100,000 barrels and this is but one of the several factories scattered all along our line of railway, all planning to do a bigger business next year. Now other canning factories are planning to establish themselves at other large apple centres. When all these factories are at work at full capacity you will readily see that they will require a large amount of fruit to keep them in operation. This means then in the future a very ready market for a considerable proportion of our fruit. Now it is the opinion of those best qualified to know that these factories will in time absorb all the lower grades of apples which we have hitherto been crowding on the English market to the detriment of our better fruit, a practice which this year they are showing their disapproval of by sending us returns which represent a net loss. The evaporators will do a good thing for fruit growers, or, what is truer, fruit growers will do a good thing for themselves if they allow the evaporators to market this class of fruit for them. It will during some years require a considerable amount of courage and perhaps entail occasionally a serious loss, but will taking one year with another result in a net gain to the apple trade.

Then as fruit growers we are up against the most serious problem of increasing cost of production. One item of course which today is reducing our profits almost to the vanishing point is the excessive freight rates which the shippers' merger is imposing upon us. The S.S. owners must be made to see that unless rates are materially lowered apple consignments to Great Britain will cease, for we cannot go to the heavy expense of growing and packing fruit to have all out profit absorbed by the S.S. companies. I hope that some action will be taken by this meeting which will serve to show the S.S. companies that a drastic reduction in freight rates is a matter of life or death to the apple trade.

But there is another item in the cost of production which I wish to call attention to and that is the matter of wages. Each year since the war began has seen a rise in wages. Now, of course, wages are governed very largely by the cost of living. When the cost of living is high, then wages must be high, and vice versa. But the general tendency of labor today is to demand excessive wages. This tendency the fruit grower, if he expects to continue in business, must resist with all the force at his command. I take it that no fruit man would for a moment be a party to paying less than a living wage to his employe, but as a business man he must realize that he cannot afford to pay wages above a certain point. To do so is to court immediate failure.

As the cost of living is bound to remain high for some time to come, we will be obliged for a time at least to pay higher wages than pre-war times; but we can greatly help the situation by engaging our help at the proper time and not waiting till the last moment, and then, in order to insure sufficient help, offering wages above the normal, thus unsettling those who have already made contracts with their employers. As growers we should stand or fall together, so that it is to our own interest to work together in the matter of wages as in every other matter.

But no persidental address will be complete without a passing reference at least to the farmers movement which is making such rapid progress across Canada. If this movement is to acquire the momentum which some prophesy it will, and ultimately sweep the farmers into control of federal affairs, then it stands us in hand to be fully awake to what is going on about us and see to it that we are fully represented by our own fruit men when that day comes. Of course this raises the question of politics, and this being a government aided organization, the matter cannot very well be discussed from this platform, and your president does not wish to introduce it only to call attention to it as one of the great world economic movements in which we are vitally interested.

In conclusion, ladies and gentlemen I thank you for the honor you have done me in choosing me to be your president for the past year, and would ask you to co-operate with me in giving an earnest consideration to all the important subjects which shall be presented to you by the various speakers who have been brought together for your benefit on this occasion.

After the acceptance of the address by the meeting, the President took the chair, which he occupied for the remainder of the evening.

Mayor James H. Yould of Kentville was then called, on and extended the most cordial welcome of the citiz ns of the town of Kentville, to the visiting delegation.

One subject that Mayor Yould hoped would be discussed during the Convention, was the subject of good roads, it being one that all organized bodies should be interested in. He told of work along this line having been started in Kentville, $50,000 already having been expended in the improving of their roads, certainly a progressive movement, and told of other improvements inaugurated in their town, showing that Kentville is forging ahead.

Mayor Yould closed his remarks with the sincere wish that the deliberations of the convention be productive of much good.

Mr. R .S. Eaton, replied briefly to the address of welcome, thanking the Mayor for his cordial welcome to the Fruit Growers' of Nova Scotia, speaking also of the growth and progress of Kentville, the coming of the Co-operative Selling Association to their town, being a sure indication that it is now regarded an active centre.

The Hon. J. Everett Kinsman, Centreville, N. S., then addressed the meeting, first congratulating the president on the very satisfactory and complete address presented.

Mr. Kinsman glanced back fifty-six years to the first meeting of the fathers of this Association, who gave it such a start, and to the growth of the Association during those years, which has made possible the splendid

markets for our fruit, seeing to the quality and shipping and securing for us our Specialists, which are second to none, which have been able to benefit the farmers in so many ways.

But in spite of progress made, he urged further effort. Production should be increased 100% both in apples and strawberries.

By orchard improvement the 3,000,000 barrel mark should be reached. Increased production will bring increased market. He felt the trade now given to British Columbia must be secured, and suggested that the building of warehouses and specializing on the putting up of fancy boxes of apples would be a means to this end. Packing only No. 1's and letting the canners take care of the seconds and thirds. The home market should be secured and held.

The Hon. H. H. Wickwire, Kentville, then addressed the meeting.

Mr. Wickwire said he had followed with pride the growth of the Fruit Growers' Association during the last 33 years, and that though great progress had been made, in this time of reconstruction and unrest it was never more necessary for everyone to give attention to the interests of our common country. It was a time of opportunity for the Annapolis Valley, and individual effort must be made.

In order to re-construct we must produce and pay our debt. Individual effort, unity of purpose, and co-operation of all the thoughtful men of this country was needed for this greater production.

Mr. Wickwire made a strong plea for Education as the foundation for all progress. See that the young men of our country are educated, so that they may compete with those of other countries. Do not make it of first importance to get them at work in the fields; educate them first that they may bring intelligent interest to their work. In any line of work a better job at less cost can be done by the man who is educated.

Mr. Wickwire then spoke of the improvement of roads in Nova Scotia, and told of the way in which this work was being carried on, and how financed, urging that the example of Annapolis Co. be followed, in increasing the road tax from 40 to 60 cents per $100.00.

He said it was certainly to the interest of all to work for good roads, none should be indifferent, it is in the interest of better transportation, and at a gathering of an intelligent body such as this, the matter should be discussed.

Mr. Wickwire in closing his remarks, hoped that the Fruit Growers might have a profitable session, and paid a tribute to the speaker following him that evening, for the large part played by him in all progressive measures.

Mr. Geo. E. Graham, General Manager of the D. A. R., to whom Hon. Mr. Wickwire referred, was the next speaker.

Mr. Graham told of the work being done along the lines of Colonization and Industrial Development, and claimed that an intelligent class of settlers are needed in the Annapolis Valley. To look after this immigration problem the D. A. R. had recently appointed a representative, namely, Mr. D. J. Murphy, whose work consists of locating vacent farms and finding out all information necessary and transferring that information to England, where hundreds of applications for such were being received.

Mr. Graham then spoke of the great need of increased production and the improvement necessary in the Boxing of Apples if Nova Scotia is to get and hold the trade that she should have. Eventually any branch of trade has to study what the consumer desires, only in this way can success be met.

The product must be improved. British Columbia was getting ahead in this, she was developing a wonderful trade right under the nose of the Nova Scotia Fruit Grower.

As a result of the War there is an abnormal taste for luxury in the general mode of living. There is now an eager demand for the best fruits at good prices.

During 1919 Halifax received 15,000 boxes of apples from British Columbia. Washington and California and other cities, such as Montreal, Toronto and Ottawa in like proportion. This should not be, there is no reason why Nova Scotia Fruit should not compare favorably with British Columbia fruit. The apples should be properly graded as to color and size, and boxed attractively, in order to get the trade and to hold it.

The cost of transporting British Columbit apples is 42½ per hundred pounds against your 20 cents per hundred. Nova Scotia should surely have the preference.

Nova Scotia in 1919 transported about 2,000,000 barrels of apples, 43% overseas, 46% West, 11% American points.

The increased use of fruit juices in Nova Scotia since prohibition was over 100%.

After the conclusion of Mr. Graham's address, Mr. Murphy was introduced to the audience, and spoke briefly of the work connected with his department.

This was followed by some excellent moving pictures, showing the beauties of the Annapolic Valley, the proper methods of Apple packing and Bee Culture. After which the meeting adjourned.

Wednesday Morning

Meeting opened, President in chair.

The first business was the appointing of the Resolution Committee, which was as follows: Mr. M. K. Ells, Port Williams, Chairman; Mr. F. H. Johnson, Bridgetown, and Captain Rawding, Waterville.

Election of officers was next in order, which resulted as follows:

President—Mr. V. B. Leonard, Centre Clarence.

Vice-President—Mr. M. K. Ells, Port Williams.

County Vice-President:
Arthur Harris, Annapolis.
J. Howe Cox, Cambridge.
William O'Brien, Windsor Forks.
John Macaloney, Halifax.
J. W. Hebb, Bridgewater.
Goudy Nichols, Digby.
W. H. Corning, Cheggogin.
C. S. McGill, Shelburne..
Prof. Shaw, Truro.
Cameron Bryan, Durham.
Sanford Purdy, West Chester.
F. R. Trotter, M.P.P., Antigonish.
J. A. MacMasters, Boylston.
Mrs. Alexander Anderson, Baddeck Falls.
Dr. A. S. Kendall, M.P., Sydney.
Father MacPherson, Glondale
Donald Urquhart, West Bay.

These Vice-President having been appointed last year, were returned as enbloc.

Secretary—Mr. Frank Foster, Kingston.

The resignation of the former treasurer, Mr. Geo. Munroe, was then read and it was moved and seconded that a resolution be drawn re the appreciation of the Association of the services of Mr. Munroe, who for so many years had held this position with credit.

Prof. Blair, Kentville, was then appointed Treasurer for the ensuing year.

Representatives appointed to the Nova Scotia Farmers' Association: Mr. Ray Clark, Mr. V. B. Leonard.

The Auditor's report was then read, vouching for all accounts and the auditors, Mr. J. E. Smith and Mr. Ernest Johnson, re-elected.

The report of the Transportation Committee was then given by Mr. Ells. felt that the organization should have a representative on the Shippers Association to facilitate better and cheaper transportation. It was pointed out the United Fruit Companies have a representative at the same.

After a little discussion of the question it was moved and carried that Mr. Frank Foster represent the Fruit Growers at that Association.

The Financial Statement for the year just past was read by the Secretary as follows:

Financial Stateent

Nova Scotia Fruit Growers' Association
In account with G. W. MUNRO, Treasurer

CREDITS

1918, Dec. 31—		
Balance on hand		$ 456.09
Glace Bay coupons		80.00
Glace Bay Bond, matured and paid		2,000.00
Received from Departmest of Agriculture		300.00
N. S. Government Grant		300.00
Annual Subscriptions		138.50

DEBITS

Printing and stationery	$ 32.35	
Expenses Annual Meeting	53.57	
Expenses and Services Annual Meeting	169.17	
Annual Report	315.75	
Executive Expenses	7.10	
Railway Commission Moncton Expenses	19.65	
Subscriptions Canadian Horticulturist	8.40	
Subscriptions Maritime Farmer	105.00	
Expenses Secretary	45.47	
Salary Secretary	100.00	
Invested in Town of Dartmouth Bonds, $2,000	1,945.86	
Postage, War Stamps and Exchange	3.85	
1919, Dec. 31—		
Balance on hand	468.42	
	$3,274.59	$3,274.59

Balance on hand Dec. 31st, 1919 $468.42

Moved and seconded that this be adopted.

The Secretary then reported the reinvesting of $2000 Glace Bay Bonds in Town of Dartmouth Securities buying at 97.30.

Acting on the suggestion of Mr. Ray Clark that the Secretary's salary be increased $50, a motion to that effect was carried unanimously.

The death of Mr. Peter Innis, Coldbrook, an old and valued member, was referred to, having taken place since last they met.

The matter of raising the Association Fee was touched on but no action taken.

A Resolution was then read from the Ottawa Garden and Florist Club.

Resolved that it is in the interests of florists and other similar commercial industries throughout the Dominion of Canada connected with horticulture, nursery stock, vegetable and fruit growing, that more greenhouse space be provided at the Central Experimental Farm, Ottawa, for the purpose of experimenting with commercial florists, plants such as carnations roses, chrysanthemums, etc., for experiments with vegetables, and for the breeding of hardy and better fruits, and that the Department of Agriculture be requested to provide these additional greenhouses as soon as possible.

The adoption of this resolution was moved and carried.

Letter read from C. W. Barter, Fruit Commissioner, Ottawa, asking that two representatives be sent from the Association to the Potato and Onion Growers' Convention at Ottawa, February next.

All present seemed to think it a good move, and it was moved and carried that Mr. Harry Palmeter, Long Island, asd Mr. Frank Foster, Kingston, be the delegates at that Convention, and a suggestion was made that the representatives while there should discuss the standard potato barrel.

Prof. Blair then gave a very interesting address on Orchard Management.

Prof. Blair showed how moderate amounts of fertilizer usually gave better results than excessive fertilization and spoke on the two methods used in orchard management, cultivation and sod mulch.

He gave facts and figures of different experiments tried on the Experimental Farm in Kentville. He urged them not to plow too close or too deeply to young trees, and to beware of excessive pruning of the same, which was so apt to be injurious, and to never thin out the young trees just for the sake of appearance, give more attention to the old trees in this line.

Prof. Blair considered 100 lbs. nitrate soda per acre the minimum that should be used in the orchards, and the minimum of slag, 500 lbs.

At the close of Prof. Blair's instructive address, a most interesting paper on "Bees, their Value to the Orchard", was given by F. W. L. Sladen, Dominion Apiarist, Ottawa.

This paper will be printed in full in a further issue.

After this address the meeting adjourned.

Wednesday Afternoon

President in chair .

The first business was the appointing of an Assistant Secretary, which had been left over from the morning business. This choice had been left to Mr. Frank Foster, who chose as his assistant W. L. Harris, Annapolis Royal.

On omtion it was moved and carried.

Cargo Inspector H. D. Johnson of Halifax, then addressed the meeting, telling of many improvements necessary in the packing, brought to his notice as cargo inspector.

The putting of one new prime hoop on each barrel, the redriving of bilge hoops, being careful that the nails were not driven too far in, seeing that the head was properly nailed, the lack of which often causes serious loss, were all valuable suggestions given by Mr. Johnson.

Mr. Johnson had been 7 years in Halifax in his present position, and after seeing the serious damage done by the way in which the apples were handled from dock to ships hold, had at last studied the matter out, and invented an automatic working platform, which carries 6 barrels on their sides to head of gangway, unloading itself when in passing the end of platform at ship's rail, it reaches a descending platform. The barrels rolling off and passing into a series of cages to the required part in the ship hold.

Three cages are built of iron, about square in shape, having steel springs sufficiently stiff to prevent barrel rolling in its descent. These cages are spaced six inches apart to enable the placing of curves in the route by means of ropes at sides to pull to and fro the line of cages.

Making a road in the form of an S and to further regulate or control speed, a hook fastened to the top of each cage can be hooked over the cage above, making a road with shorter curves, this will not likely be necessary, but is there to use if called for. At the bottom a spring padded platform absorbs all shock and rolls barrel out of the way of one following.

This is called an Equalizer and is necessary because of the lack of uniformity in the size of barrels.

Inspector Vroom supported what Mr. Johnson had said; he had seen the working of the apparatus and thought if worked out, it should revolutionize the handling of barrels of apples.

He said Mr. Johnson had not had the support of the steamship people he should have had, and suggested a Committee be appointed to inspect this appliance.

Mr. Vroom said it had been brought to the notice of Mr. Moore, Chief of Market Division, who was very favorably impressed, and promised to see about its use in Montreal.

Mr. Johnson has applied for patient both in Canada and the United States.

Col. McCain spoke favorably in regard to the device which he had seen work, and spoke of the deplorable way the barrels were handled by the workers, no attempt being made to look after a bilge hoop needing attention.

N. S. Dairymen in Annual Session

The Seventh Annual Convention and Creamery Butter Exhibition of the Nova Scotia Dairymen's Association was held in the N. S. A. C., Truro N. S., on January 22nd and 23rd.

Mr. Harold Falconer, the president of the Association, presided at the session and conducted affairs in a prompt and businesslike manner.

The President's Address

Gentlemen:

It is with much pleasure I welcome you at this opening session of our Seventh Annual Convention, and trust that each and everyone of you will spend a pleasant and profitable time for the next two days. We all take special pleasure in welcoming our old friend, Mr. G. H. Barr.

In arranging or programme we found that we would require considerable more time than we had in former years, as Mr. Barr has a new meature for the convention this year in the samples which he has sent here from th Dominion Educational Butter Scoring Contest. This feature, as you will see by the programme, will be taken up at this afternoon's session.

In reviewing the Dairy Industry in Canada for the past year, the first in the reconstruction period after the great war which has devasted the world to such a great extent, some of the outstanding features are the high markets, the Orangization of the National Dairy Council and the conducting of the Dominion Educational Butter Scoring oCntest. As we all know, the markets for the year just closed have been the highest in the history of the world, so that notwithstanding the high cost of production the returns have been very favorable. In the organization of the National Dairy Council the Dairy Industry has taken a very great step in advance. I might j ust mention one or two things which alone would justify the organization of the National Dairy Council: First is the market reports and news letters sent out by the Dairy Department at Ottawa each week this past summer, and which one Creamery manager told me had saved his Company enough money on one week's butter to enable him to pay the cost of his Company's tax for the upkeep to the National Dairy Council many times over. But there is one outstanding feature which is the outcome of the National Dairy Council, this is the Dominion Educational Butter Scoring Contest where each province in our fair Dominion is putting butter each month during the summer in competition with all the other provinces in the Dominion and a detailed report of the result is sent to each Creamery competing and I understand is available for any who apply for the same.

In reference to some of the problems which will come before us for discusion is, the Financing of the Association, The Maritime Dairy School, The Development of Cow Testing, The Future of the Asosciation as regards place of holding convention and Insurance. These subjects will all be brought up under their proper place during the convention.

In closing I would like to impress on you the importance of getting into all the meetings on time, and if we are to receive all the benefit we should, each and every delegate and member, take part in the discussions.

I thank you for the honor you have conferred on me in making me Prsident, and for your indulgence in listening to these remarks.

I will now call in Mr. W. A. MacKay for his report as Dairy Superintendent.

Mr. W. A. McKay read his eighth annual report as Dairy Superintendent for Nova Scotia. The report shows the splendid progress that is being made along dairying lines. It is so replete with interesting facts that it will be published in full in the next number of the Maritime Farmer.

(Sgd.) CHARLES R. B. BRYAN.

Jan. 15, 1920.

We will also publish the report of Dairy Inspector Mr. R. S| McLennan in the same number. Mr. McLennon severs his connection with the Department of Agriculture in the near future, much to the regret of his fellow dairymen, in order to devote his full time to a creamery business which he is establishing in Truro.

Maritime Dairy School

Mr. J. D. McKenzie, chairman of the committee appointed last year to promote the establishment of a Maritime Dairy School at Truro, reported progress. Th old committee was reappointed to continue the work.

Herd Improvement

Mr. H.R. Brown delivered a thoughtful and forceful address on the subject of Heird Improvement. He outlined the work that is being accomplished along Cow Testing lines in Nova Scotia. This work is the basis of increased average production in the herds. Dealing with the breeding phase of the subject Mr. Brown said a lot of depreciative remarks were beinb made about the scrub bull, but his pure bred brother of low production ancestry was not above reproach. Pressure should be brought to bear on breeders of pure bred stock to force them into the system of keeping records by educating the Agricultural Societies and general public to insist when purchasing bulls that they be shown the record of production of the dams. When Societies and private individuals insist on the purchase of only R. O. P. stock the breeders must fall in line or go out of business. The third factor in herd improvement was the feeding problem and creamery men as they converse with their patrons may do a lot of good by conducting a better feeding propaganda. "Every patron a keeper of records," should be the slogan of every creamery man in the province. In closing Mr. Brown thanked the creamery men for their past co-operation and especially thanked Dairy Supt. McKay and the Agricultural Representatives who had very materially assisted him in his work during the past year.

Mr. Geo. Barr, of the Dairy Division Ottawa, expressed his appreciation of Mr. Brown and his work, referring to him as one of the livest wires of the department and one whose work and ideas are frequently held up as incentives to other members of the staff. Every farmer should know just what every cow in his herd is producing and then weed and feed accordingly. Every effort should be put forth to swat the scrub bull whether of the mongrel or pure bred type. Mr. Barr strongly urged the creamey men to do their utmost to get each one of their patrons to keep records. He also led a discussion on the advisability of confining cow testing to one day per month weighings and testing instead of three times per month as at present.

Th Educational Butter Scoring Contest

The work of this commendable featur as carried on by the Dominion Dairy Division last season, as referred in these columns several issues ago, was outlined by Mr. Barr, who had samples of western and Maritime Province butter for examination by the Association. Mr. Barr's summary of this work will appear in a future issue of the Maritime Farmer.

At the Thursday evening session a series of educational motion picture films depicting dairy scenes were shown. Dr. Cumming explained that during the coming season pictures of local scenes would be made and shown in various sections of the province. Dr. Cumming also addressed the audience on the subject of "Rural Problems." Dr. Cumming has devoted a lot of thought to this subject and as a close student of human nature marshalls facts and figures that are especially convincing.

At the conclusion of Dr. Cumming's address Mr. Barr was asked to present the prizes awarded at the Butter exhibition. The addresses were interspersed with a number of vocal selections by Miss Phillips ,of Truro, and Mr. Geordie Cameron, of Scotsburn.

A butter scoring competition was the main feature of the Friday morning session. In this competition the majority of the creamery men present took part. A list of the awards will be published in our netx issue.

Following the competition Mr. Harvey Mitchell led a discussion on the Butter Exhibit. Mr. Mitchell hit straight from the shoulder, without fear or favor and the various defects which were attributable to careless workmanship and disregard of well recognized modern principles were clearly set forth.

Mr. Barr followed in a similar strain during which there was a free and easy discussion of the various butter samples, some of which were good, bad and indifferent. The 96 exhibits graded 5 specials, 28 No. 1's, 33 No. 2's and 30 off grade.

Mr. Barr said three factors must be considered in the butter trade. The manufacturers, the dealers and the consumers. He advised the manufacturers and dealers to get together to produce and put on the market the uniformly good grades that the consumers demand. Referring to the comparatively small percentage of specials at the exhibition he said there was absolutely no reason why all the samples were not in the special class, if due attention had been paid to the essential details of care of cream and manufacturing principles. Pasteurization, he said was the keynote of sucessful butter making. Safety first and safety all the time by proper pasteurization should be the dairymen's slogan instead of pasteurization for special orders only.

Officers for Ensuing Year

The election of officers resulted as follows:

Directors—J. D. McKenzie, Rev. M. M. Tompkins, Ronald Rutherford, R. T. Stewart and R. B. McLennan.

At a subsequent meeting of the Directors Mr. J. D. McKenzie, manager of the Bridgewater Creamery, was elected president and R. B. McLennan, of the Truro Creamery, vice-president.

W. A. McKay, Dairy Supt., was re-elected Sec'y-Treasurer.

Auditor— C. R. B. Bryan.

Delegates to the National Dairy Council: Harold Falconer, Stellarton and Capt. Hugh Dickson, Truro.

It was unanimously decided that the next meeting of the Association be held in Bridgewater and that henceforth from year to year in differ-

FEBRUARY 3, 1920

A NARROW NATIONAL POLICY

At the recent meeting of the council of Agriculture and the United Farmers, held in Manitoba, it was decreed that the Dominion Government be asked to continue sales of wheat, until such time as the markets of the world are normal.

This we take it, is part of the **New National Policy**, this particular feature of which has been devised largely for the benefit of the Grain Growers of Alberta, Saskatchewan and Manitoba.

The Maritime Farmer does not propose to criticise the demand, except to absolutely condemn the restriction which surrounds it.

A guarantee of the price of wheat was a war measure and as such was accepted loyally by the farmers of the Maritime Provinces.

Then when the United States in 1919 decided to guarantee $2.26 per bushel for wheat, Canada was, through the demands of the Grain Growers, forced to adopt a very similar policy.

Again, the farmers of Nova Scotia, New Brunswick and Prince Edward Island fell into line and "paid the piper."

The war is over now and if prices are to be guaranteed for farm products, then in the opinion of the Maritime Farmer, the generosity of the people of Canada should be taxed as well for those farmers who do not grow wheat, as for those who do.

If we are to have an inflated price for wheat —then let us have the same measure of protection extended to the dairy and other products of the Maritime Provinces.

If this thing is to be perpetuated, in the name of all that is fair and reasonable, insist that the Dominion Government fix a minimum price for our milk, butter, cheese, potatoes, apples, etc., which farmers must produce in the Maritime Provinces.

The **New National Policy**, of which so much has been said, invites Maritime Province farmers to continue to pay fifteen to twenty dollars a barrel for flour, from fifty to seventy dollars per ton for feed, any old price for oats, and at a time when investigations are being conducted with a view to lowering the price of milk, the production of which depends on a supply of mill feeds at open market prices.

Recently the farmers of Eastern Canada have been compelled to pay increases for flour and feeds, because the Grain Growers, having agreed to accept a fixed price for their wheat, demanded a new arrangement the minute the terms of the original agreement ceased to favor their pockets.

Has anybody a guarantee that the same loose methods will not be followed in 1920, provided the Dominion Government is foolish enough to adopt the suggestions of the Grain Growers, or as they are now styled, The United Farmers of Alberta. Saskatchewan and Manitoba.

With these organizations we have no quarrel. But when they solemnly ask that the one commodity they specialize in be given special preference, while the farmers of Eastern Canada are to be taxed to the hilt to pay the bill, the Maritime Farmer protests to the utmost against such a rank injustice, unless the same consideration be given our own farming industries.

Before this outrage is permitted, Maritime Province farmers should insist upon a hearing at Ottawa. The various farm organizations should send delegates to Ottawa to call for a fair deal all round.

Boost wheat prices if you will, but protect the farmers of the East is the motto of the Maritime Farmer.

The Maritime Farmer has bought hundreds of thousands of dollars worth of feeds for farm organizations in the Maritime Provinces, during the past few years, and it knows only too well how the pockets of the farmers of the East will be taxed if this feature of "The New National Policy" is brought into effect.

The Maritime Farmer is intended to serve the interests of **ALL The Farmers of the Maritime Provinces.** It knows no class and takes its orders from no political organization.

When the Grain Growers' Guide sought to buy the Maritime Farmer (and we might have sold for a big figure), we declined to sell, preferring to maintain our independence in order that we may best serve the farmers of Eastern Canada and maintain a Maritime Province viewpoint.

We have no interest in the price of wheat except to offer the strongest possible opposition to any proposal which will cost the Maritime Provinces hundreds of thousands of dollars in 1920-21, provided this policy as suggested at Winnipeg be adopted.

When we decided that a farm paper in the Maritime Provinces, (absolutely independent of western control) might be a good thing for the Maritime Province farmer to have, we little thought that the need would be so quickly and effectually established.

If we must have artificial prices for wheat let us have artificial remuneration for milk, butter, cheese, eggs, potatoes, apples, and the other produce of the farms of Nova Scotia, New Brunswick and Prince Edward Island. If we are to be specially taxed for the benefit of the West, then the West must be taxed on our produce.

Maritime Province farmers would do well to look after their own interests. We understand them better than they do in Winnipeg, and are therefor in a better position to present our side of the argument. Let us do that. The farm associations of the three provinces should wake up.

We invite an expression of opinion on this subject, one which means so much to this part of Canada.

It was said that New Brunswick was represented at the Manitoba conference, which decided on this injustice to non-wheat growing provinces. The representation would seem to have been of a very doubtful character. New Brunswick may well pray to be preserved from such advocates of her interests.

If you agree with this article, drop us a line. If you don't, write us in any case and give your reasons for desiring to heavily tax Eastern farmers for the benefit of a class, the members of which have more crop failures than any other branch of agriculture in Canada.

Possibly it may be that we are to be asked to pay for the Western Crop disaster of 1919.

Well, the Maritime Farmer is against that, as strongly as the English language will enable this paper to express its opposition.

Just think a little more of the Maritime Provinces. The West should take care of itself.

So far as organization of the farmers is concerned, the Maritime Farmer has done its bit to bring that about. We believe, however, that organization should be achieved along sane lines, and in our own interests. We have as much brains here as in the West. Then let us use them in our own defence against such wild schemes as that with which this article deals.

GREATER PRODUCTION CANADA'S NEED

"While we and the rest of the world are failing to produce on a sufficient scale to provide for human comfort and to pay our debts, the price of everything has so increased, that although all clearing-house and trade returns show higher figures in money, these generally represent transactions based on smaller quantities of merchandise, and because we think in terms of dollars and not of merchandise, we are living in a fool's paradise."

These striking words are from a thoughtful and comprehensive address which Sir Edmund Walker, president of the Canadian Bank of Commerce, delivered on Tuesday, 13th inst., at the annual meeting of the shareholders. Sir Edmund is not a pessimist. On the contrary, he is an optimist, and in respect to the potential possibilities of the Dominion no one is more confident in his faith.

But he is an expert diagnostician in respect to financial, industrial and economic subjects, having for it by a practical banking experience extending over a period of more than half a century. And as such he is able to discern the weak as well as the strong points obtaining in the industrial, social and economic life of the country to-day.

Like other close students of the situation, Sir Edmund realizes that while on the one hand the financial requirements of the Dominion are greater than at any time in its history, we are not, on the other hand, producing at even normal capacity. True, the factories of the country are busy, but it is somewhat rare to find a plant running to full capacity owing to the shortage of labor and the indisposition of a proportion of work-people to bend their energies to securing the maximum of production. The writer was informed only a few weeks ago by one of the best authorities on the subject that quantity production in Canada was on much about the same scale as five years ago, when the capacity of the plants of the country was much smaller than it is to-day.

Unless there is a continuation in the development of the industrial resources of the country of that same spirit of superb co-operation which was manifested in winning the war, Sir Edmund points out that "we may lose all that victory seemed to secure by indulgence in countless theories, many of them aiming at the disintegration of

society, instead of again co-operating in one ideal—the restoration of order and the improvement of social conditions, so that the happiness of the greatest number may be secured. The rising curve of prices cannot be made to turn downward without an increase in production nor can we face the heavy obligations left by the war except by greatly increasing production."

Further on he gives us a glimpse of what some of these obligations are. The public debt, for instance, will be $1,950,000,000 when the current fiscal year ends in March next compared with $336,000,000 six years ago, while the sum total of the interest charges on the aggregate foreign debt of the country now amounts to about $190,000,000 annually, of which $125,000,000 is payable in Great Britain, and Europe, and $65,000,000 in the United States.

Besides urging the necessity for increased production, Sir Edmund pleads for a curtailment in imports, and particularly in merchandise designated luxuries, in order that both a favorable trade balance in the external trades of the country may be maintained and that the interest charges on money borrowed abroad may be liquidated without our having to resort to the harmful expedient of shipping gold, a contingency that would seriously impair Canada's credit. Provided Canadians bend their energies in the right direction, Sir Edmund Walker is quite confident that the country will be able to win out in spite of its heavy obligations.

Sir John Aird, the general manager of the bank, also gave a careful and lucid resume of the situation during the course of his address before the shareholders. His reference to the situation in respect to foreign exchange was particularly interesting and illuminating. As to the cause of the abnormal rates obtaining he said: "It has perhaps become fairly generally known among these who take an interest in the matter that our imports from the United States greatly exceed our exports to that country, and that in the case of Great Britain, the reverse is true, our exports greatly exceeding our imports. Therefore, in the case of our trade with the United States, there is a scarcity of bills receivable which we can set off against our bills payable to that country: while in the case of our trade with Great Britain the reverse is true; and the bills receivable exceed the bills payable to such an extent that she has been forced to obtain credit from us for many of her purchases of foodstuffs produced in Canada." Sir John points out that a still further factor is the credits granted France, Belgium, Greece and Roumania, and to some extent Great Britain, for manufactured goods, the raw materials for which are largely imported from the United States, and have to be paid for in each. Still another factor is interest payments on our foreign debt. "The rehabilitation of our dollar," he declared, "can only be accomplished by saving, economy and greater production."

Sir John again referred to the gold mining industry, and urged that in order to increase production the Government should take steps to encourage the exploration and development of the gold-bearing areas of the country.

Dealing with his own bank he showed that its net profits for the year, at $3,074,000, were the largest in history.

INCREASE ORCHARD PLANTINGS NOW

This is an opportune time to extend our plantings of apple trees. The experience of recent years in this province has demonstrated that commercial production of high quality apples that are in good demand on a variety of markets is practicable and fraught with no greater dangers than in many other apple sections of the Dominion. The ability of our growers to realize top prices for their apples on the largest competitive market in Canada, (Montreal), and to do that practically at the first attempt, has added greatly to their confidence in their own province and its climate as being adaptable for commercial apple production. Thus, our growers have added confidence in their ability to grow good apples and market them successfully in open competition with the apples from long established fruit growing sections, hitherto considered as more favorably adapted.

Speaking of the apple industry in Ontario, in the October issue of the Canadian Horticulturist, Professor J. W. Crow said, "The disposition of our apple orchards has been so serious that Ontario will soon be reduced to the necessity of importing apples to meet our home requirements. Our orchards have not been taken care of as they should have been, and many of them are rapidly dying out. This condition existed even previous to the war, and during the past five years has been intensified by the shortage of labor. Possibly not over 1 per cent. of the orchards of the province have been given proper attention during the past few years. Added to all this the heavy freeze the winter before last has had a disastrous effect. In Northumberland county, which is one of the heaviest apple-producing sections of Ontario. I am inormed that 50 per cent of the apple orchards have been destroyed. The loss among even the better cared for orchards runs as high as 30 per cent. There is no reason to believe that conditions in Northumberland county are exceptional. It is evident from this that the industry has suffered a severe blow and that many years will be required before normal production will be restored."

In the Province of Quebec the situation is far worse for a recent census of apple trres there showed a loss of approximately 1,000,000 trees since 1911, or nearly one-half the bearing trees. This was due to the the severe winter of 1917-18, but the cause went farther back than that as many orchards were dying through old age and neglect previous to that winter. As yet, this great loss is not being replaced by new plantings.

In the State of Maine about one-half of the Baldwin trees were killed by the winter of 1917-18.

The orchard situation is extremely backward in Europe, having suffered heavily from the war. The bearing trees have been neglected and are ruined in the war area, and in great areas where the actual fighting did not take place, they have been very much neglected.

It is highly improbable that the price of apples will ever get back to pre war levels. In the great neglect of European orchards, the shortage of seedling stock, increased prices for everything and the great damage done to orchards in Quebec, Ontario, Maine and the Eastern United States, by the severe winter of two years ago, lies the opportunity of the present for the enterprising fruit grower in New Brunswick and eastern Canada—in contrast to the bogey of over production preached so often a decade ago.

There is a great scarcity of fruit trees and small fruits and in most places the prices for apple trees have doubled since last year. The enormous reduction in the amount of French Seedling Stock available for propagation purposes and the consequently greatly increased price of same, plus the increased cost of all other steps in the making or growing of the trees, have caused this large advance in prices. **By spring or before then the prices of the most popular varieties will, no doubt, have advanced—and some varieties will not be available at any price.** There is no probability that nursery stock will be any cheaper in 1921 or for the next three or four years, so if you have been thinking of planting more orchard or filling in vacancies, don't delay doing so in the expectation that prices will be cheaper.

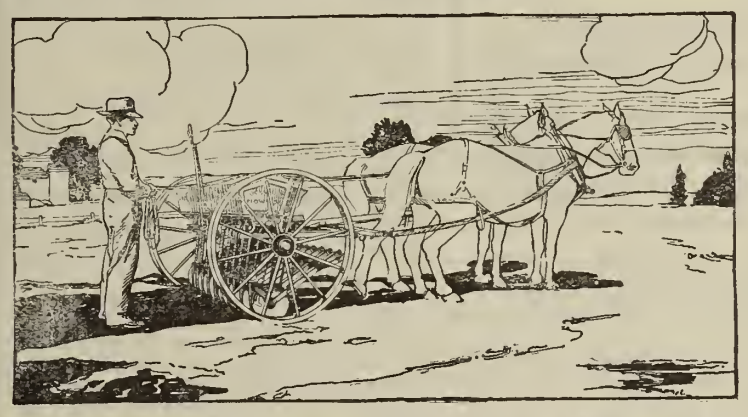
Prices for apple trees are running from 50 to 60 cents in Ontario and from 75 cents to a dollar in the United States but are still quite reasonable here at from 35 to 50 cents according to the varieties and size of order.

If you want any nursery stock, write immediately to the New Brunswick Fruit Growers' Association, Fredericton, N. B., stating your requirements and asking for a list of available varieties and prices. Already a number of the varieties are practically unobtainable so send your orders in at once—not in two or three weeks time, but now—otherwise you will very likely not able to obtain what you want.

COCKSHUTT

Proper seeding and efficient fertilizing are big factors in securing a bumper crop

The use of commercial fertilizer at seeding time is a common-sense method of restoring your land's fertility. The best skill of our designers, coupled with actual field experience, has resulted in the Cockshutt Grain and Fertilizer Drill, with positive, variable feeds—acting entirely independently, handling any kind of seed and fertilizer and depositing them in the ground in any desired quantity



Cockshutt Fertilizer Drill

The underlying principle of all Cockshutt construction—light draft with an ample margin of strength—is secured by all-steel construction, high grade bearings and ample provision for oiling. Both wheels are drivers, so a maximum of power is secured and proper work is done at all times. The multiple Disc Gear is a most accurate device for controlling the flow of the seed. The fertilizer feed can be changed to suit any fertilizer used. The Discs are set at just the right angle to open a proper furrow for the seed and fertilizer. They do splendid work. Made in either Disc type with 9, 11 or 13 discs with 7" spacing, or 9, 11 or 13 Hoe type with 7" spacing, and zig-zag feature.

The choicest of seed and the finest land will not give you a proper crop unless you seed right. For best all-round service you need a Cockshutt Fertilizer Drill—it's great popularity is due to merit only. See it at your dealer's or write today for Pamphlet "Cockshutt Fertilizer Drills."

N. S. FRUIT GROWERS IN ANNUAL CONVENTION

(Continued from page 294)

S. C. Parker suggested the best way to look after the bilge hoop was at home.

Dr. Cumming then made a few brief remarks, which he did not consider in the way of an address.

As the Association was largely responsible for the Agricultural College, he thought they would be interested to know that this year, as far as attendance and interest, is the best. They have had 105 students enrolled in courses as compared with 43 last year, with 48 returned soldiers additional taking special work.

The Short Courses were very successful, 146 farmers and their sons, with 50 returned soldiers, being in attesdance.

Dr. Cumming told of attending the Seed Selling Fair, recently in Prince Edward Island, and how six different men had spoken of getting their start in improved seed growing and improved methods of farming at the Agricultural College. He spoke also of the real effort being made by the College to get the farmers to grow Clover Seed in Nova Scotia.

Prof. Brittian, who was to have addressed the meeting, being on leave of absence, taking a post graduate course at Cornell, Mr. Good representing him gave an address on General Results from Orchard Spraying and Dusting.

Mr. Good thanked the fruit growers for the assistance they had always given them in their work and spoke of their indebtedness to Mr. Sanders for many suggestions and helpful criticism.

He first referred to the appearonce of the apple sucker in Nova Scotia which had been discovered in Wolfville. In appearance it resembeles the apple aphis and was a destructive pest causing leaves, blossoms and young fruit to drop, but at the present time there was no cause for alarm as it had made no great headway. Although it was an unwelcome settler there were others that were worse.

Mr. Good told of the methods of combating these insects and fungus pests and of the good results obtained from the use of lime sulphus, espescially in the control of apple scab.

He warned them against too heavy spraying in the case of the fourth application as it was apt to be very injurious. The method of employing the lime sulphur had more to do with the results than the strength. Do not use lime sulphur at high pressure, always in form of a mist.

The spray should not be blamed always for the dropping of the apples. Very often it was due to imperfect fertilization.

If a spray was wanted that could be used any way at any time Mr. Good suggested 2-10-40 or 3-10-40 Bordeau, the best results at less cost being received from this, than from any other formula.

The question of dusting or spraying was then taken up by Mr. Good, who claimed both were alright, properly applied, the posibilities of either method had by no means been exhausted.

He had found the best results from dusting obtained when done in the early morning before the dew is off.

A discussion of this paper followed arguments being brought forth for and against. Mr. E. H. Johnson, Wolfville, had only one year's experience in dusting but obtained good results; he had found from experience that put on the dry leaf it was practically no good, the time to dust was when the trees were wet, and he considered that one point in its favor, it can be done in bad weather, whereas the spray has to be put on in fine weather, when perhaps the time was needed elsewhere. Where he had dusted well he had almost perfectly clean fruit. Mr. H. J. Johnson, Lakeville, said he was very well pleased with the dusting results, found it saved a lot of time over the spraying method. Found it best put on the trees when wet and a heavy breeze not favorable to dusting. He had applied 4 dustings to his orchard, 72,000 lbs. in all. His Gravensteins were perhaps not as good as in 1918 when sprayed but on the whole was as well pleased with results. Mr. Ells had applied three or four dustings, but in so sketchy a manner, as he did not have a dusting machine of his own, that he was not qualified to speak of results.

Mr. Foster then read a letter from J. P. Raymond, Berwick, who claimed very good results rom dusting, but complained the price of dust was too high. He had used sulphur dust from Niagara Spray Co., also from United Fruit Cos., keeping plots separate through the season. As far as he could tell one gave as good results as the other and both very good. Perhaps the Niagara dust spent a little farther, as it apepared to be more finely ground. He had been dusting for the past three years.

A very interesting discussion followed on the paper given by Prof. Haden in the morning on "Bees, Their Value to the Orchard." In answer to the question as to which variety he would advise, Black or Italian, Prof. Slader said in his locality it made little difference, perhaps the Italian Bees resist disease best, are also more asily handled and more profitable. In a climate where the summers were below 70 degrees Black Bees were more favorable.

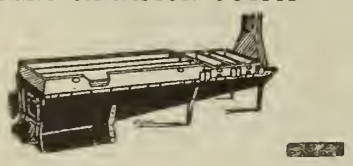
To the question if it was feasible to import by the one or two pound package, he said it could and was done but it was best only as a last resort. If so parcel post was the best way to have them imported, a week before dandelions bloom the best time to receive them and of course the combs must be ready to give them.

Besides the danger of them dying on the way, dealers were not always reliable and very often disease was introduced among them.

Here's the Evaporator to Solve the Syrup and Sugar Problem

Thousands of grove owners do not work their groves for very little reason. Lots of them just can't make up their minds. Yet if we were to put a proper outfit in their grove and they saw it work so easily and the money there was in it—for one season—they would fight to prevent us taking the outfit away again, even if the cost were a good deal more. An unworked grove these days is like an untapped reservoir with thirsty people around. A big demand and no supply. Why not put a

GRIMM CHAMPION OUTFIT



in your grove. One of a right size to work your bush to full capacity. Then there will be no waste and every dollar extra means more production. We can fit out any grove from sap spout to Champion Evaporator. Get in touch with us right away.

Prof. Slader said the best way was to take care of your own and bring them up and invest in an Italian Queen. Good management of bees more to be urged than race.

It was moved and seconded that in the publication of the new report that the picture of the ex-president as well as of the new president be included, the ex-president's picture not having been printed in last year's report as has always been the custom.

Mr. Foster drew the attention of the meeting to the fact that all had not paid their dues and urged all who were not already members to join. A one dollar fee for which they received their choice of the Maritime Farmer or Canadian Horticulturist for a year, the yearly printed report and the honor of being a member of the organization.

Meeting adjourned.

Wednesday Evening

President in the chair.

This meeting opened with an address by Prof. W. T. Macoun, Dominion Horticulturist, on "Recent Experiments of Interest to Nova Scotia Fruit Growers." Prof. Macoun told of travelling through every province in Canada and visiting the thirty Experimental Stations and sub stations throughout.

Owing to the wire variation of climate in Canada what method would do for cultivation in one part would be of no use in another. He said that he was not afraid to say that the fruit growers of the Annapolis Valley were second to none in intelligence and if they did not live up to their knowledge it was not because they did not understand. Prof. Macoun said the best time for the germination of fruit pollen was when the temperature was at from 70 to 75 degrees Fahrenheit.

Wet or cool weather is adverse to fertilization. More experiments are needed in the different soils. It had been shown that moderate thinning gave the best results and that severe pruning retarded fruitfulness. Every fruit grower should be a constant reader to keep in touch with the best results.

Prof. Macoun drew attention to the origination of new varieties of apples at Ottawa which were being tested out at the Experimental Station at Kentville for use in the Annapolis Valley.

Mr. Osborne, Mr. Margeson and Mr. John Buchanan took part in the discussion following this paper.

Mr. McMahon asked what varieties were found most suitable to Nova Scotia and was told that the Milwaukee had been proved by Prof. Blair to be the hardiest, getting 125 barrels to the acre. Appearance and quality of the red variety seem to take preference.

Prof. Macoun said there were 30 men in America breeding new apples. He himself had already named 100 new varieties and he prophesied that in the next 25 years the varieties they will have will be entirely different from those they now raise.

This discussion was followed by an address on "Transportation and Co-operation," by A. E. McMahon, Kentville, manager of the United Fruit Growers Co. Mr. McMahon in opening his remarks hoped that Prof. Biair would introduce three or four varieties of apples that would take

(Continued on page 314)

Choose the best Fertilizer!

Instead of *pricing* the next fertilizer you buy—investigate first the **quality.** For it is *quality,* not mere bulk, that gets results. The time to ask the price is when you have made sure of quality.

We can prove to you—and the proof we furnish will be borne out by your own experience later—that Monarch Fertilizer is the best that money can buy.

Its qualities are the result of knowledge—not guesswork. It contains Nitrogen or Ammonia, Phosphoric Acid and Potash. The Ammonia, which is the plant grower, is derived from materials which dissolve in the soil-water in proper order as the season progresses. This results in a crop that is not only larger, but better in quality—and stronger.

Our free booklet, "Fertilizer Results by Satisfied Users," gives evidence that you ought to see. Write for a copy to-day.

DAIRYING.

CARING FOR THE DRY COW

It is not so very long ago that the dry cow received very little care or feed from her owner, but by this time dairymen have learned that the dry cow needs and must have as much feed as is given to a producing cow. And she also must be well cared for during the entire period of pregnancy.

Sixty-five per cent. of the total development of the embryo calf takes place during the period of gestation—and most good, well managed dairy cows are dry for less time than this—so, during this time the cow must receive enough feed to maintain her strength, and enough more to produce from seventy-five to one hundred pounds of live flesh. The feed that goes to produce the embryo corresponds to that which the producing cow expends in making milk and butter fat.

The cow that is left to shift for herself in the old way in an old field or dry pasture may look fairly well because her prodigious appetite at this time enables her to consume lots of very coarse feed, but when the calf is dropped, it will be found that it takes a great amount of feed and much time to get such a cow to producing profitably again. Besides this the cow is injured permanently, and her producing life is shortened. Also the calf from a cow carried through the dry period in such a manner is seldom of any great value, being a weakling from the start.

On the other hand, the cow that is carried through the two or three months in which she is dry on a good pasture, with plenty of feed to keep her in condition or on a good stable fed ration, comes into milk under circumstances that make for maximum production from the start. In the matter of feeding, there is a saving of feed in keeping the cow in condition because she produces from the start on regular feed, while the thin cow must be fed the maximum ration for some length of time before she proddces at all profitably. The cow treated in such manner produces well for some time longer than the other, remaining dry the next time for only a short while, and in addition she lives long and bears up well. Also, her calf is a good one and such as will help to build up the herd, while by the other methods the effects of years of careful breeding are undone.

However, the too fat cow seldom has a good calf, and much may be wasted in keeping the cow too fat. Fortunately there is a safe medium ground, and it is not hard to find.

The feed for dry cows need not differ materially from the feed given producing cows and the amounts need not differ much. To prevent overfattening at the expense of lessening the bone and muscle of the embryo, the dry cow should not be fed as much fat producing grain concentrates as the producing cow. Oats and bran are the most excellent concentrates for feeding the dry cow. As calving time approaches the cow needs some laxative feed. Oil meal is an excellent concentrated laxative. Silage is a good succulent laxative, especially in winter.

The chief rough feed should be good legume hay, preferably alfalfa, or ,in its absence, clover hay. Not too much of the coarser roughages should be fed, though some is good to make the feed more bulky.—K. Perkins.

WE HAVE NOT TOO MANY GOOD COWS

The high price of good cows does not indicate that there are too many cows. When it costs from $100 to $125 to buy an ordinary cow. it looks as if they were not very plenty. You cannot buy a good cow for less than $125, and pure bred cows command a stil higher price.

Nor is this too high a price, the way feed and labor are. It costs heavily to raise a cow from the calf up. The figures named do not much more than pay the farmer for what he has actually laid out to get his cows. This is not speculation, then, but good common sense on the part of the farmer when he says, "I must have so much for this cow. I know what she costs me, and I feel that I have a right to expect cost back, with some margin for profit."

It is very possible that we have too many poor cows. That has always been the case. Few farmers but will admit that they have some cows that are not doing as well as they should. The cost of feeding and caring for these inferior cows is just as great as it is for the best grade of cows. Here is the real test of the situation. Shall we not put better cows in the place of the poor ones? If not, why not?

So what we want is not fewer cows but better cows. All the poor ones ought to go, not to take their places in the pastures of new owners, but they should be put entirely out of the way. To do this will call for a great widespread inquiry into the qualities of all the cows of the country. Cow testing should be pressed by individual farmers and by organizations for that purpose. Nothing the dairy farmers of any comunity could do would be more worth while than to constitute themselves an investigating committee of the whole, to determine which are the cows to keep and which are the ones to let go. At a very small expense per member farmers can find out just what any cow of their herd is doing. These inquiries ought to extend over a period of time long enough to prove without doubt the real worth of every cow; and that settled, definite action may be taken.

No, we have not too many cows, but we do need better cows.—E. L. Vincent.

GROOMING CATTLE GOOD BUSINESS

There is nothing that will improve the general appearance of a herd of cattle more than the frequent use of the currycomb and brush. It sleeks them up, puts their hair in fine condition, and goes a long way towards keeping them healthy and free from vermin.

Currying cows and heifers regularly was not a common practice in our own herd until a few years ago. It was not considered necessary, and required, as we then believed, too much time to be profitable, but that is not the case today. A visit to the farm of one of Canada's most prominent breeders some few winters ago found the owner and his men busy brushing off the finest herd of cattle it has ever been my privilege to inspect. They were as clean and sleek as a well-groomed horse, and the owner told me that he could not afford to keep them otherwise. He explained that his cattle were healthier, were better feeders, and produecd more milk as a result of the regular brushing they received, and that he would not think of keeping a herd without grooming them regularly. I was impressed with what he told me, with the sight of his herd, but most of all with the financial returns he was obtaining from them, consequently I decided to employ some of his methods of management on our own herd as soon as I returned home. Regular grooming was one of the methods immediately adopted and the results have been far beyond my expectations. The cattle are producing better, lice and vermin are unknown, they look better, are easier to keep clean, and the milk is more cleanly and wholesome. In short, regular grooming and frequent clipping has made a marked change in the results obtained from our herd and more than pays for the time required. The work can be done in a very few minutes provided it is done regularly, and no manure is allowed to cake on the flanks or lower parts of th eanimals.

The work is best done, I believe, by the use of a circular comb and a stiff brush. With us the latter is used for removing the finer particles of dirt and dust; it should used exclusively around the legs and under parts. The comb is used in parting the hair and allowing the brush to reach the animal's head. After brushing, an old bran sack or woolen cloth rubbed over the animal wil remove

(Continued on page 320)

The world's welfare will be, to a great extent, determined by the dairy farmer's efficiency in the production of dairy foods.
(Signed)
P. M. SHARPLES
"There are no substitutes for dairy foods."

Does your present separator skim clean at any speed?
—SHARPLES *does.*

Does your separator produce cream of even density at any speed?
—SHARPLES *does.*

Has your separator a simple bowl, no discs, washed in a jiffy?
—SHARPLES *has.*

Has your separator a knee-low supply tank and automatic oiling?
—SHARPLES *has.*

Is your separator made by an all-American manufacturer, the world's largest and the pioneer American Separator manufacturer?
—SHARPLES *is.*

THE Sharples is the "Suction-feed" separator. All others are "fixed-feed" machines. No matter what the make of your present separator, the Sharples is so much more efficient (so far ahead mechanically) that it will pay you to scrap your inefficient "fixed-feed" and install the Sharples Suction feed.

THREE CHEERS AND A TIGER FOR PERCY H. MOORE ANO HIS FAMOUS COW

Not many men connected with Maritime Agriculture is beter or more favorably known than is Mr. S. G. Moore, of Truro, N. S. Mr. Moore farmed extensively and practically in the rich Shubenacadie district, where he conducted dairying operations successfully with a high grade of Guernseys. He was also a breeder of Oxford Down Sheep and a prominent exhibitor at the Halifax exhibition along these lines.

It is only quite natural that a live young man brought up in an environment of this kind should early in life follow up the practical teachings and ideas gleaned on his father's farm by taking the opportunity of a two year course at the Nova Scotia Agricultural College and rounding out his B. S. A. degree at the Ontario Agricultural College. This was the coruse pursued by Percy H. Moore, one of Mr. Moore's sons, who not only made an enviable record for himself in his college career but has also made good in his chosen avocation since leaving college.

After graduating he was for a time connected with one of the United States Departments of Agriculture, from which position he received a call to become Dairy Commissioner for British Columbia. His next call was to superintend the Dominion Experimental Farm at Agassiz, B. C. From Agassiz he went to take charge of the Colony Farm at Essondale, B. C., where he is still in charge.

While looking over a recent copy of The British Columbian, published in New Westminister, B. C., we were pleased to note that Mr. Moore had recently been appointed director of the Holstein-Friesian Association of Canada for British Columbia, to fill the vacancy caused by the resignation of Dr. F. S. Tolmie, following the latter's appointment as Minister of Agriculture for Canada.

The British Columbian said: "A firm believer in the value of Holsteins from a milk producing standpoint, Mr. Moore has acquired a reputation since he took over the management of the Colony Farm some years ago. Mr. Moore is also secretary of the B. C. Holstein Association."

Depicted in the same page on which the above mentioned notice appeared was a splendid photo of the Holstein cow Zarilda Clothilde 3rd De Kol, developed and owned by the Colony Farm. This cow has recently completed a great record of performance which has smashed all previous Canadian milk production records. She gives first place by just an ace to only one cow in the world, Tilly Alcurtra, of California. Zarilda Clothilde 3rd following a record second to none in following a record second to noe in Canada. The British Columbian says: "Yesterday official word was received from the headquarters of the Holstein-Friesian Association of the United States, giving statistics of Zarilda's performance during the past three hundred and sixty five days, during which time she was on an official test under the auspices of the Canadian government stock department. During the year Zarilda has produced not less tan 33,153.6 lbs. of milk or 1194.17 lbs. of butter. This is 88 lbs. of milk less than the record of Tilly Alcartra, a California Holstein which bids fair to smash a world's record this year. Zarilda's nearest Canadian competitor is Jemima Johanna, of Rierside, a Holstein owned by W. C. Houck and Sons, of Black River, Ont., which has a record of 30,373 lbs. of milk to her credit.

For the past five years Zarilda has been topping off records on a par with an Olympic runner, but this year is her best. Incidentally it will be her last official test, for Mr. P. H. Moore, superintendent of the Colony Farm, beliees Zarilda has played her part in attracting the attenion of Canada and the United States to British Columbia and more particularly to the farm, and he will now devote his attenion to several promising Holsteins which he is grooming at the present moment and from whom he confidently expects to grab off a world's championship during the next two years.

Despite the fact that she lost out to Tilly Alcartra in the recent test, Zarilda holds quite a few records herself which have yet to be approached either in Canada or the United States. These are for six months, one, two and three years. Her average during the past three years is: Seven days, 822 lbs. of milk and 29.68 lbs. of butter; 365 days, 31,145 lbs. milk and 1,082.17 lbs. of butter.

As a two year old she broke a Canadian record with a seven day test, which resulted in 445.1 lbs. milk and 18.39 lbs. of butter.

At four years and two months she broke a world's record for seven days, viz., 817.4 lbs. milk and 28.87 lbs. butter. This record has never since been approached. At six years she broke still another world's record which stood until last year when it was captured by a California cow. These figures were: 7 days, 831.3 lbs. milk, 31.12 lbs. butter. In 30 days she produced 3331.7 lbs. milk and 122.25 lbs. butter. In 365 days she produced 30,-467.3 lbs. milk and 1,071.34 lbs. butter.

No other cow in Canada and only one in the world has ever produced over 33,000 lbs. of milk in a year, or 63,620 lbs. in two years, or 93,400 lbs. in three years.

Upon receipt of the wire from W. H. Gardiner, superintendent of advanced registry of Holstein cattle, of Delavan, Wis., Mr. P. H. Moore was naturally elated at the success fo Zarilda. To the British Columbian he stated that this is a concrete example of the value of purebred stock as compared with grades. ' farmer who invests, if only in one or two thoroughbred animals, to form the nucleus of a pure bred herd, is going to be o winner,' states Mr. Moore. 'They cost money to purchase, but the results justify any dairymen going in for blooded stock, if only for purely commercial and not for show purposes.' "

WHY
DE LAVAL
CREAM SEPARATORS
ARE BEST

There's a reason for everything, and surely one for the superiority of DE LAVAL separators.

The DE LAVAL was the first continuous discharge centrifugal cream separator. Invented in 1878, it has led ever since. The great DE LAVAL shops in both America and Europe are devoted solely to the production of centrifugal separating and clarifying machines.

Large staffs of DE LAVAL experimental and developmental engineers, in both America and Europe, constantly devote their time, skill and knowledge to the further improvement of the DE LAVAL Cream Separator.

Every single step of cream separator advancement, for forty years, has been DE LAVAL conceived or developed.

On the other hand, practically every feature of construction ever used in any other cream separator has been one that run-out DE LAVAL patents let free. Such features have then always been out of date in the later improved DE LAVAL construction, and most of them were never quite good enough to have been actually used in DE LAVAL construction at all.

It might aptly be said that DE LAVAL has forgotten more about cream separators than its imitators and would-be competitors ever knew.

And then it must be remembered that the cream separator, with its necessarily high revolving speed, great capacity, ease of operation, simplicity and durability, is a very difficult machine to build right, and can only be built right with long experience, highly skilled employes and a vast amount of special equipment. Hence there's nothing strange about the fact of DE LAVAL Cream Separator superiority.

BUTCHERING THE GOOD SIRE

Aaggie Cornucopia Pauline Count 13th was a purebred Holstein bull, who met a premature fate at the hands of the butcher before his real worth was known. This herd sire was sold for $50. While he headed the herd of his owner, he sired 11 daughters who, it was later found, averaged in yearly production 572.1 lbs. butterfat. When the daughters were of breeding age, the sire was sold to avoid inbreeding. At three years, one daughter, Springdale Clothilde Vale, produced 18,829 lbs. of milk and 735.25 lbs. of butterfat, more than 900 pounds of butter in a year, making a state record for junior three year olds. Colantha Clover Lawn, another daughter, produced 15,300 lbs. of milk and 597.4 lbs. of butterfat. The lowest production among these 11 daughters is 508.9 lbs. made by a two-year-old. Five daughters were three years old, six two years old, when records were made. Co-operative bull associations would prevent the loss of such valuable herd headers.

Stringy milk is generally caused by bacteria which enters the milk after it has been drawn from the cow. It is not caused by feed or any abnormal condition of the cow. Milk affected in this way is not unhealthful, but it certainly is not appetizing. The bacteria which causes the trouble live in water ordinarily, and may enter the milk from the cows' bodies or from utensils. Where trouble is had from this condition, the utensils, especially the strainer cloth, should be boiled. If this treatment does not eliminate the trouble, the fresh milk should be heated on the stove to a temperature of 100 degrees, let stand for 20 minutes after, then cooled as quickly.

There were 80 cows entered in the dairy test at Guelph this year, and the first three places were won by Holsteins, with a Jersey in fourth place. The champion cow was Roxie Colantha Queen, a four-year-old Holstein, owned by Mrs. C. C. Best, of Jarvis, Ont. She produced in three days 253.5 lbs. of milk testing .4 per cent. butter fat. Her total score was 280.6 points. Lady Comet Ormsby won second place for J. G. Currie, of Ingersol, with 278.84 poits, while A. E. Hulet, of Norwich, Ont., captured third money with Butter Girl Schulling. Fourth place was taken by a Jersey, Brampton Bess Bevan, owned by J. A. Bagg & Sons, Edgley, Ont. Her production was 173.2 pounds of 4.9 per cent. milk and her total score was 259.10 points. Fifth place was taken by another Holstein, Cornish Lodge Margaret Mercedes, owned by Haley & Lee, Springford, Ont.

LIVE STOCK.

SHEEP AND EXTERNAL PARASITES

The production of a good crop of wool depends upon the farmer's feeding management and general winter care given shoop. It is not generally realized that a relationship exists between feed consumed and wool production. When a sheep is well nourished and thrifty, the wool fibre pushes out strong and full, and there is sufficient flow of oil from the root to keep it bright and smooth. When a sheep is poorly nourished, on the other hand, the wool is poorly nourished also, and it is thin, weak and dull. The man who wants to produce ether much wool or good wool must keep his sheep well fed. A sheep produces its best wool, as well as its larges amount at the age of one and two years. After that time the wool begins to grow coarser, duller and less in quantity. In extreme old age a very poor wool is frequently produced, for the reason that the fibre is poorly nourished. In this old wool there is often times no opening or medulla in the centre of the fibre, and it therefore fails to take a dye in the process of manufacture. There are far too many lambs sold every year out of the farm flock while many aged ewes are retained that might much more profitably be disposed of than the fine wool-bearing youngsters.

External Parasites

It is as necessary to take precautions against the external parasites that play such destruction, not only to the wool crop, but the general health of the flock. Dipping is the only way to free a flock from pests. Ticks cause the flocks untold annoyance, and for these dipping is thoroughly effective. Ticks and red lice do more damage than many are aware of, because the evidences of annoyance that they give sheep are not so marked as in some other troubles, but they are none the less a severe check to their well doing. Dipping, followed faithfully each year, will completely remove the baneful results from the presence of these parasites. For the eradication of scab, thorough dipping stands first among remedial measures.

Dipping does more than destroy the pests. It also cleanses the skin, cleans the wool, and, particularly encourages the best growth of the latter. To get the fullest returns in these directions, dipping should be done twice each year—in the spring shortly after shearing, and again in the fall. Not only is the growth of wool better from the semi-yearly dip, but it adds to the function of the fleece as a protection to the sheep.

Sheep that are dipped never have ragged fleece; dipping keeps the fleece intact. There is no call for them to rub against wagon wheels and other implements left around where sheep have the run of the yard. It also lessens the tendency for sheep to lose their wool in spots too early in the season.

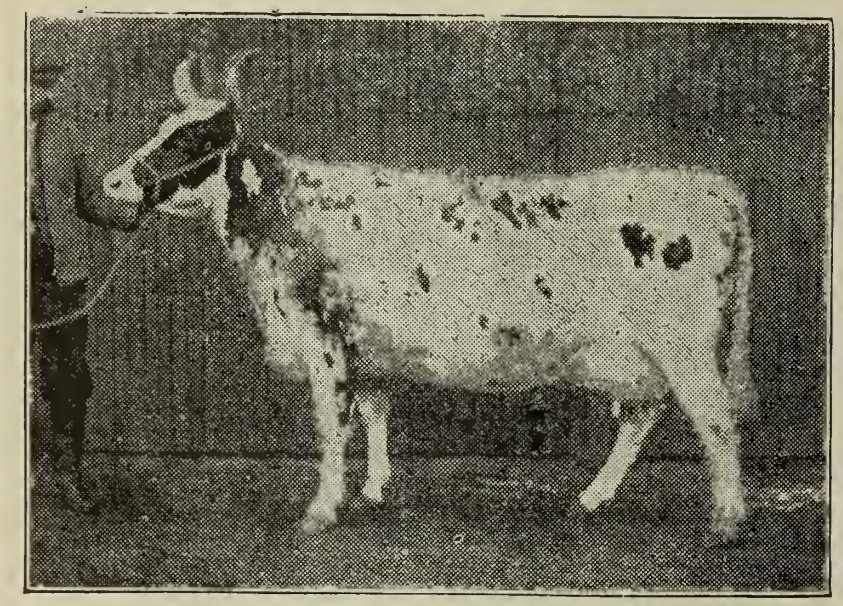
Necessity of Fall Dipping

It is hard to measure the damage that is done to the fleece alone, to say nothing of the thrift of the sheep, by overlooking dipping in the fall. It is quite common to see sheep around the farm in the wintertime with fleeces badly torn through irritation from parasites and dirt that collect. Such fleeces are also likely to become cotted, especially if the sheep have not been dipped in the spring so as to encourage the secretion of the wolk.

A fibre of wool is covered with scales that overlap each other similar to the shingles on a roof. To keep these scales down and prevent them from warping, there must be a liberal supply of yolk in the fleece. If this yolk is not secreted, owing to the unthrifty condition of the skin, the scales rise and the fibres become matted, and finally so bad as to be known as cotted.

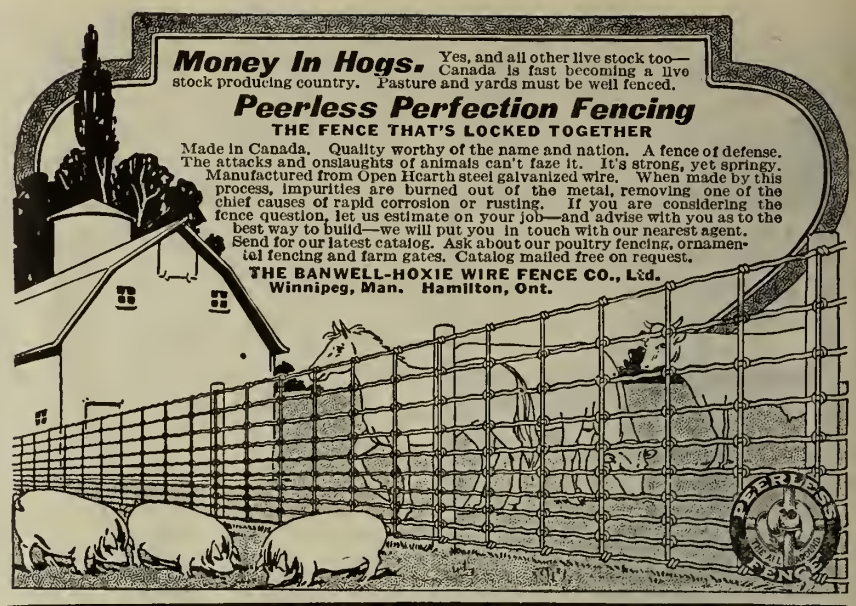
Ticks and red lice are not the only external parasites; there is the scab mite that is so small that it requires the aid of the microscope to see it. Though invisible to the naked eye it is perhaps one of the most troublesome and unthrifty of parasites. It is easily spread through contact with affected animals, or with objects against which they rub. Any appearance of the ailment should be promptly treated. An animal suffering will dig itself with its hind feet, or rub against some object until the skin is lacerated. One sure sign that the sheep are affected is the presence of sweat spots in the fleece. Dipping twice, with a period of a week or so between dipping times, will generally accomplish a cure; but all the places in the yard or sheep barn that they have come in contact with will require to be disinfected and lime washed.

But if a farmer finds that his sheep are badly infested with ticks and lice in the winter time, dipping by plunging them in a tank is entirely out of the question. The difficulty can be overcome by pouring the dip along their backs and rubbing their sides with both hands so that the whole of the under part of the wool is saturated. But even in doing this, shelter inside a barn or shed free from draughts must be provided for them, till the sheep are dry. Several applications by this means, about a week apart each time, will be necessary before the tick trouble is overcome.



The above is a picture of "Gardrum White Floss"—45352—the Ayrshire cow owned by the Nova Scotia Agricultural College at Truro, N. S., which won in the Dairy Test over all breeds at the late Winter Fair at Amherst, N. S.

In 72 hours under test she gave 198.1 lbs. milk, 8.74 fat, scoring 270.97 points. She is by Gardrum Prince (Imp.) and is strong in Garclaugh blood in Scotland. Her dam, "Scottie's White Floss", had 2 R. O. P. records made at 3 years and 5 years of 8233 lbs. milk, 341 lbs. fat, testing 4.1%, and 12, 166 lbs. milk, 512 lbs. fat, testing 4.5% respectively, and was sired by "Scottie"—19718—who has 24 daughters qualified in the R. O. P. The granddam of "White Floss" was "White Floss of Brookside" out of Royal Star of Ste Annes.



Money In Hogs. Yes, and all other live stock too—Canada is fast becoming a live stock producing country. Pasture and yards must be well fenced.
Peerless Perfection Fencing
THE FENCE THAT'S LOCKED TOGETHER
Made in Canada. Quality worthy of the name and nation. A fence of defense. The attacks and onslaughts of animals can't faze it. It's strong, yet springy. Manufactured from Open Hearth steel galvanized wire. When made by this process, impurities are burned out of the metal, removing one of the chief causes of rapid corrosion or rusting. If you are considering the fence question, let us estimate on your job—and advise with you as to the best way to build—we will put you in touch with our nearest agent. Send for our latest catalog. Ask about our poultry fencing, ornamental fencing and farm gates. Catalog mailed free on request.

Winnipeg, Man. Hamilton, Ont.

CANADIAN SHEEP BREEDERS' ASSOCIATION

The following agreement has been made between the Canadian Sheep Breeders' Association and the American Shropshire Registry Association by which there is a mutual reciprocity in registration.

1. Animals from the United States, American bred or imported from Great Britain, sold to a resident of Canada, must be recorded in the American Shropshire Record in the name of the Canadian purchaser. American Certificate of Registration must give date of sale and delivery and, in the case of females, servce certificate, if bred. It is understood that animals, on entering Canada, must be ercorded in the Canadian Sheep Breeders' Record.

2. Animals from Canada, Canadian bred or imported from Great Britain, sold to a resident of the United States must be recorded in the Canadian Sheep Breeders' Record in the name of the American purchaser. Canadian Certificate of Registration must give date of sale and delivery and, in the case of females, service certificate, if bred. It is understood that animals, on entering the United States, must be recorded in the American Shropshire Record.

3. It is understood that the recording of ancestors to complete pedigrees is to be discontinued immediately by the American Shropshire Registry Association and the Canadian Sheep Breeders' Association, respectively.

4. It is further agreed that the Canadian Sheep Breeders' Association will not accept for record Animals lambed in the United States, unless such animals are first recorded in the American Shropshire eRcord.

5. It is further agreed that the American Shropshire Registry Association will not accept for record animals lambed in Canada, unless such animals are first recorded in the Canadian Sheep Breeders' Record.

Sheep Feed Loses its Virtue

While it is of the utmost necessity to dip breeding sheep so that they are entirely free from parasites at lambing time, it is as necessary for the health and growth of feeding sheep. With the breeding flock the ticks invariably migrate in great numbers onto the lambs, and a serious loss to early maturity is thus fostered. With the feeding sheep there is a great loss sustained in the use of concentrated feeds, when fed to tick infested sheep. Sheep lose that thrifty condition that is necessary to rapid gains where ticks prevail and extra feed will not give the expected returns. It is good policy to take it for granted that feeding sheep are in need of dipping, rather than wait for the evidences of it, which usually comes along when the sheep are offered for sale.

VITAL FACTS AND FIGURES FOR THE PROSPECTIVE SHEEP BREEDER

(Experimental Farms Note.)

Many enquiries are being received from prospective sheep breeders, principally returned soldiers, as to the number of sheep which certain types of land will carry and the possible profits from sheep farming. Arable land of good quality and productiveness used exclusively for sheep can be made to support from 5 to 8 ewes (with their lambs until marketed) per acre. On rough or hilly pasture, with sufficient adjacent arable land for the growing of winter feed, 5 ewes per acre should be considered a maximum and possibly not more than 3 per acre should be put on at the start until full carrying capacity of the land is determined. For every ten ewes there would be required for winter feed the

GENERAL IRONWORK
SHINGLE and LATH MACHINES
Mill Equipment, Contractors' Supplies,
Furnaces, Stoves, Implements
The SMITH FOUNDRY COMPANY, Ltd.
FREDERICTON, New Brunswick

following or its equivalent:—5 tons clover hay; 4 tons roots; or 2 tons each of roots and ensilage; 18 bushels oats; 300 pounds bran; and 150 pounds oil cake meal. To grow these crops, with the exception of the bran and oil cake meal, would require at least 2½ to 3 acres of arable land. As the sheep will receive a certain amount of pasture as well as the winter feed from the arable land, it may be presumed that for each acre of rough pasture land, carrying from 3 to 5 head of sheep, there should be one acre of crop land. On this basis a 100 acre farm, half rough pasture and half tillable land, should carry 150 to 200 breeding ewes with their lambs, together with three horses, 3 cows, and 2 calves per year.

The farm flock is a source of revenue twice per year. In the spring the wool clip yields on an average of 7 to 10 pounds per ewe which at the conservative price of 60c per pound nets about $4.50. Again lambs consisting of wethers and ewes not reserved for breeding purposes, are marketed in the early fall. These do not require much feeding other than the milk of their dams and good sufficicnt forage such as can be had on any farm at that time if plans are laid properly. Such lambs weighing from 70 to 100 pounds at time of shipment in late August and September, have brought as high as $17.50 per cwt. In September this year they brought $14.00 per hundredweight or $11.20 for the average lamb. The cost of feed for a ewe for one year is around $5.00. Against this there is a revenue of $15.70 or a profit over feed of $10.40. This is on a basis of one lamb per ewe. The extra lamb often obtained will take care of all losses and still help to swell the profits. If pure bred sheep are handled and the choice ram lambs are sold for breeding purposes this income per ewe would be considerably increased.—Geo. M. Muir, Assistant in Animal Husbandry.

CANADIAN SHEEP BREEDERS' ASSOCIATION

The following Directors for the Canadian Sheep Breeders' Association for the year 1920 were elected by mail votes counted in the presence of a Notary Public in the office of the Secretary, Parliament Buildings, Toronto, on December 22nd, 1919. The Directors for Ontario will be elected at the Annual Meeting to be held in the Carls-Rite Hotel, Toronto, at 8.00 p.m. on Tuesday. February 3rd, 1920.

Alberta—R. Knights, R. R. No. 1, Calgary, Alberta.

British Columbia—S. F. Tolmie, R. F. D. No. 4, Victoria, B. C.

Manitoba—George Gordon, Oak Lake, Manitoba.

Maritime Provinces—W. B. Bishop, 85 Germain St., St. John, N. B.

Quebec—James Bryson, Brysonville, Quebec; Arsene Denis, St. Norbert Station, Quebcc; Victor Sylvestre, St. Hyacinthe, Quebec.

Saskatchewan—Fred T. Skinner, Indian Head, Sask.

CANADIAN SWINE BREEDERS' ASSOCIATION

The following Directors for the Canadian Swinc Breeders' Association for the year 1920 were elected by mail votes, counted in the presence of a Notary Public in the office of the Secretary, Parliament Buildings, Toronto, on December 22nd, 1919. The Directors for Ontario will be elected at the Annual Meeting to be held in the Carls-Ritc Hotel, Toronto, at 8.00 p.m. on Monday, February 2nd, 1920.

Alberta—G. H. Hutton, Lacombe, Alberta.

British Columbia—Albert G. Marshall, South Westminster, B. C.

Manitoba—W. H. English, Harding, Manitoba.

Maritime Provinces—J. F. Roach, Sussex, N. B.

Quebec—Frank Byrne, Charlesbourg, Quebec; M. Ste. Marie, Compton, Quebec.

Saskatchewan—Philip Leech, Baring, Sask.

TIPS FOR CO-OPERATIVE BUYERS

Feeds—The Maritime Farmer will buy feeds, flour, oats, etc., for your Agricultural Society in car lots, and have them delivered to you at cost.

Seeds—We have part of a car of No. 1 Timothy seed to offer at an attractive price to farm organizations.

Hay—We offer 150 tons of good hay in Nova Scotia.

Mixed Fertilizers—If you want mixed fertilizers at cost, car lots, write us, we can give you the closest price on the market.

Auto Tires—Write us for your supply in 1920. We can save you many dollars.

Organize—And avail yourself of the benefits of Co-operation. It has saved other farmers tens of thousands of dollars. It will save you just as much.

BULL SOLD FOR $5,000

At a live stock sale held at Brandon recently, 102 Shorthorns sold for $54,200, an average of $537. "Lavender 47th," a prize Shorthorn bull, sold for $5,000 to Chas. Beeching, at De Winton, Alta. It is stated American buyers offered $8,000 for this animal, but the breeder, John Barron, would not consent to it going out of Canada.

THE DECEPTIVE DISPERSION SALE

When a person states to the public that he intends to quit breeding cattle and advertises a dispersion sale, the public has a right to believe that a statement of fact is being made. No man has a right to advertise a dispersion sale unless he intends to dispose of his entire herd. It is misleading; it is dishonest to so advertise, and then retain the best animals either by bidding them in at the sale or otherwise retaining them.

We regret there are breeders who have advertised dispersion sales when in fact they had no intention of selling all their cattle. The word carries in meaning that all animals will be sold, both the good and the bad, and that there will be opportunity to purchase some at bargain prices, because everything is to be offered to the public. The owner in holding a dispersion sale believes he can obtain a better average price for his stuff at a pubic dispersion sale than by private sale. The public is attracted to a dispersion sale because it believes that opportunity will be offered to pick up a few bargains. The occasion becomes inviting because the owner is playing for the best prices he can secure and the public is using its wits to drive good bargains. This method of buying and selling is fair, provided the owner does not offer diseased or unsound cattle and holds none in reserve. The seller takes his chances on receiving a good price and the buyer in paying a low price. Such sales have their advantages as they sharpen the wits, stimulate interest, and provoke a deeper study of animal values.

When the seller, however, lays plans to retain the choicest animals without notice to the buyer, he is taking an advantage which cannot be sanctioned by honest and fair-minded men. It is nothing more than deception. It is cheating. Such sales help to destroy the confidence in all sales and rob men of their just rewards. A dispersion sale should never be advertised as such, unless the owner intends to sell all his cattle. The word dispersion should never be used when the purpose is to dispose of only the culls of a herd. A man who would dispose of culls in this way is no gamster; he is not willing to play fair; he would bribe the umpire in a contest that his team might win. Gain obtained in this way does not measure the ability of the man or enrich him in the confidence of his fellowman.

A dishonest bargain is always a poor one no matter how great the gain. The largest and most substantial wealth is good character.—Hoard's Dairyman.

ALPHA

A good trade-mark on your Gas Engine

The Alpha trade-mark on a Gas Engine shows that the owner invested in a high-grade engine to get the longest possible service with the least possible bother.

The Alpha furnishes the cheapest dependable power and it is simple, easy to start and keeps right on going.

It is made in twelve sizes, from 1½ to 28 H.P. Each size furnished in stationary or portable styles, and with hopper or tank cooling.

THE HORSE

HANDLING KICKING HORSES

Their Making and Breaking

Common Cause of Kicking

The most common cause of kicking in horses is bad treatment. At some period of their life, even when in colthood, before hitching them up they have been subjected to an unfair deal by some senseless individual. There are still some men who treat their horses as they do their machinery, act as if horses had no feeling or any mental activity. They have no sympathy for the animal, and have no interest in studying its temperament. Some horses are born vicious; they get it from their parents, but more are made vicious from a lack of sympathy for the domesticated animal's comforts or feelings.

Some horses are not naturally of a vicious or sulky disposition, but have learned to kick solely as a result of some untoward or thoughtless act on the part of the owner or caretaker. Th eproper thing to do in such a case is to try to re-establish the confidence of the animal, and make him forget his hostility by consistently kind treatment, combined with frequent attentions when the horse is in the barn. If the habit is not of too long standing and has not become completely ingrained in the horse, it may be eradicated by these means.

Making the Kicker

When a horse gets a raw deal from a man who lacks horse sense in dealing with him, he uses the methods that nature provides him to defend himself. If he is held by a halter, he kicks, and if in the field or free, he runs away. Speed is the horse's chief means of fighting or escaping his natural enemies, and kicking is his tactics at close quarters. It is his only way of expressing his feelings towards cruel treatment, and it is the horseman's duty to find out the cause. Invariably it is his fault.

An illustration of what very often is the cause of starting a horse to kick lately came under the writer's notice, which may have some points in similarity with the case of your horse. A young driver that had done specially well in harness for a few months, all at once developed a mania to kick. His first outbreak was when he was one day hitched up in the buggy. He struck out when his owner got seated in the buggy for the start away. After that the rest of the outing for that day was done without any further signs of the vice. The next time he struck out was when the harness was being put on in the stall. This led the owner to do some thinking, and it led to connecting the harness with the newly acquired vice. He made a minute examination, and discovered a very small blister, just behind the armpit, that had been made by the bellyband. The animal was a keen, sensitive, intelligent horse, and when the wound was healed he showed less resentment to harnessing and hitching, but ever after when anything was wrong with the harness in the hitch up he always used his feet to express his resentment. In a case like this the use of a whip would have made the horse a confirmed kicker. Always do some thinking and close examination before using the whip.

When to Punish

In regard to actually punishing horses when they kick it depends entirely upon circumstances, and discretion must be observed. In many cases, actual punishment would certainly make matters worse, and serve to aggravate the habit instead of counteracting it. To hit a horse in the stable with a whip is often a very sure way of making him a kicker; many a horse has been turned into a pronounced kicker by this custom. After some horses are subjected to a whipping in the stall, they get suspicious of every person that passes behind them with a fork or cane in their hand, and immediately take on teh defensive. In some cases, however, the infliction of punishment on an incipient kicker by means of a cut with a whip, whenever the animal kicks, is attended by satisfactory results and helps to stop the habit.

But all success in dealing with kickers depends upon the disposition of the horse, whether it is advisable or the reverse to inflict punishment in the stable with vice or youthful unruliness. In any case great discretion must be exercised in regard to kicking and in the majority of cases punishment will be out of place and harmful. With many horses plenty of hard work is all that is needed to render them more amenable and better behaved, and stop the undesirable habit. But that does not mean bad usage, where hard work and under feeding go hand in hand. A well fed and well cared for horse, though grain hard and regular work, will not resent the treatment, while an underfed, overworked horse will contract a sour and sulky disposition, and show his resentment by kicking. On the other hand the fact of a horse being "lifey" owing to too little work and too much grain feeding, is very apt to bring out any vicious tendencies which may be latent in his nature.

In dealing with vices of all kinds found in horses, it is necessary to take advantage of the limitation in his mind, that makes him reason almost wholly from experience and convince him that after all man's will is superior to his, and that he has no alternative but to obey. But the better reasoning powers of man should be able to diagnose the case, and know whether the habit of kicking at persons without any real provocation is due to excessive high spirits or the result of sheer vice.

One thing certain the tendency to vice in horses is hereditary and whatever other good qualities they may have, the vicious animal, male or female, should never be bred. Indication of a good disposition is not one of the least points to look for in horse judging, and in choosing for breeding it should have more votaries among breeders.

EFFECTS OF SWEAT PADS AND ILL-FITTING COLLARS ON FARM HORSES' SHOULDERS

The number of queries directed to The Maritime Farmer asking advice regarding galls and shoulder sores on horses has prompted the writer to devote an article on the question of fitting the collar, and the effects of using Sweat Pads. Observant horsemen find that every horse is a problem in himself so far as his collar is concerned. The collar is the most important part of the harness. To some men the collar is just a collar; so long as it has the semblance of that article, it is put on to any horse regardless of its size or shape to fit the animal's neck. The horse has to wear it even though it only touches the shoulder at one or two points. If this practice is common, it is not any wonder that there are so many horses and colts with ugly collar bruises.

The Fault of the Collar

In the majority of cases the prevention of these blemishes lies in the first working year of the colt. The normal shaped shoulder can be made accustomed to the friction of the collar, if the collar fits as it should. There are all sorts of necks and shoulders. There are the prominent shoulder blades which are the hardest problems a farmer has to meet in collar fitting. But every shoulder, whatever its shape, can be fitted, if the farmer takes the trouble to do so and uses a little consideration taken from his own experience, where a hard starched collar on his own neck, a size too small or too large, causes irritating friction, and unbearable firing, that soon gets the cure in consigning the collar to the rag bag. The case of the horse is far worse, for his collar is not hung on to him as an ornament.

Sound shoulders in a horse at all times is to be had only by having a collar that, in size and shape, fits the neck and shoulder. The collar is nothing more than a cushion to protect the shoulder from the hames, and keep them from cutting and injuring the skin and muscle. It must be made so that the thickest part will be opposite where the shoulder is heavily covered with muscle. This will be found two-thirds of the way down from the top of the shoulder. If the collar is heav-

THE LAWRENCE-WILLIAMS COMPANY, Toronto, Ont.

ily padded on the parts of the shoulder that have but skin covering the bone, then there will be trouble. Also if it presses on the windpipe, the case will equally be bad. All pressure must be kept from this part of the neck, as pressure closes the windpipe and stops the breath of the horse. When a collar is a perfect breast fit, one should get the hand in flat ways between the collar and the breast.

Another part that must be kept free from pressure is the point of the shoulder where there is no cushion of muscle to cover the bone; any pressure on this part will very quickly cause a sore. The part of the neck that has the thickest covering of muscle is on the upper part of the shoulder blade, and it is here where the pressure of the collar must come. It is the point that the draft on the hames is placed, and the hames are the business part of the neck harness.

The Use of Sweat-Pads

Regarding the use of sweat-pads there is a great difference of opinion. They are a part of harness that is never used in Scotland, and perhaps the writer may be accused of prejudice, but his opinion of them is, that they are a poor makeshift for a bad fitting collar. The sweat-pad may be of some value in changing the fit of the ill-fitting collar in either length or width, but a well fitting collar never will require this arrangement, and no horseman should ever put an animal to work without seeing that the collar fits snugly. It is also used to change the seat of pressure, but it is much more advisable to use a smooth leather surface to preserve a healthy condition of skin. The hot, sour, sweat-soaked pad is much more apt to scald the skin. It is not commendable to use pads even in an attempt to heal shoulders already sore. The pad will absorb the exudations from day to day, and during the night they will harden into an instrument of torture. A readjustment of the collar is preferable to the use of sweat-pads. The use of the sweat-pad is advocated by some as necessary when the horse's neck gets thinner as the work progresses during spring time. But here again it is the fault of the collar. The case is bad indeed that cannot be handled better without the pads, the pad being mostly an excuse to fill too large a collar. A perfect fitting collar is half the battle.

How Snoulders Have Sores

Too many collars are far too thick on the upper half where the skin only covers the bone, and are also fixed with a strap and buckle at the top. A proper collar is a firm one, made complete in one piece, and not divided at the top. This necessitates the horse having to aid in getting it over his head, btu that is a very minor part in his training, and never causes any difficulty when practiced. The collar should taper up very thin at the top, so that little difficulty will be found in adjusting it to meet the shrinking neck. The writer never used anything more elaborate than a small triangular pad at the tip of the collar to bring the lower part to the required position opposite the hames draft point. This also brought the hames to the proper position, and saved the point of the shoulder from becoming sore. If the hames draft is on the point of the shoulder, it does not take long for a gall sore to arise. The sore that arises directly on the place where the hames draft should be, is due to the collar cushion not being firm enough at that point, and the thickness of a sweat-pad is not enough to supplement a suitable collar pad. If the soreness is farther up the shoulder, it is due to too thick padding of the collar over the part where the skin lies over the bone. If the collar is too loose it will cause friction; if too tight, it will choke the horse, and also cause sore withers.

The hames should also fit the collar; if too long, they will probably be buckled too tight at the top, and in this way the collar will be made to pinch the horse at the top. Sores thus produced begin by a pimple or very small boil, often overlooked because the mane covers it.

The best collar fo rthe mature horse, whose weight does not vary much throughout the year, is the leather collar. But for most horses, the best collar is the one stuffed with hair and covered with ticking. With this collar, if the horse's shoulder becomes sore at any point, the lining of the collar can easily be ripped, and the hair removed or pushed aside at that point, so that no pressure will come on the sore place.

Keep Skin and Collar Clean

But collar fitting is not the last work in keeping horses' shoulders free from sores. Collar fitting must be accompanied with keeping the skin on neck and shoulder clean, and free from dust and dried sweat. Every night in the busy season the shoulder should be bathed in cold water in which there is added a little vinegar or salt, which will help to toughen the skin to stand the pressure. Never use a curry comb, on the horse's neck or shoulder; the brush is quite sufficient to keep that part clean, if the cleaning is done before the sweat gets into the hardened and pasty condition. The curry comb is too sharp, and will irritate the tender skin around the head, neck, and shoulders. And by all means keep the inside of the collar clean. Everytime the collar is taken off, have it wiped dry with a cloth kept for that purpose. If the horse is warm at the noon hour, the collar should be taken off, wiped clean on its facing, and set out for a few minutes to dry in the sun. The shoulder should also be bathed in water and dried. If the harness is not taken off at noon, the collar facing and the shoulder should get attention, and what cleaning it is possible to give. Many horses that have become confirmed "balkers" have been made so by no other method than the hot and blistered shoulder.

MARE SWELLS IN HIND LEGS

I have a mare that swells up in hind leg when standing in stable. What is the cause and how should she be treated? J. S.

Evidently your mare is suffering from stocking, a trouble common in badly drained and badly ventilated stables, and young horses are more subject to it than older ones. It is often the symptom of some disease that requires attention. Give your mare the following tonic, one powder night and morning in her feed, made as follows: one and a half ounces pure sulphate of iron; two ounces of nitrate of potash, powdered and mixed together, and divided into twelve powders. Do not wash the legs in winter weather. Bandage them tight with flannel bandages when she comes in from work or exercise. Remove the bandages when going out for work and give her legs lots of hand rubbing. Do not use irritating or blistering applications.

You make no reference as to how you feed her, but her ration should include succulence which can be given by roots, clover, or alfalfa hay. Half the quantity of grain that is necessary when working, is enough when idle. Overfeeding with hay is treated in an article appearing this same issue of the Farmer. Look it up and read it.

HORSE MEAT FOR BELGIUM

Newspapers state that a Calgary firm has secured orders from the Belgian Government for 500 barrels of horse meat. It is reported there are 50,000 horses in Western Canada of little or no use, which could be used for this purpose.

POULTRY.

THE NEWFOUNDLAND POULTRY SHOW

Several years ago the Editor of The Maritime Farmer had the pleasure and privilege in company with Prof. J. P. Landry of the N. S. A. C., of visiting a Poultry Show at St. John's, Newfoundland. We have always looked back with pleasure to the days spent in the Ancient Colony, despite the fact that we had to pay our toll to the god Neptune. A more friendly class of people we have never met. They certainly know how to make the stranger feel at home in Newfoundland.

The Newfoundland poultry men can make a splendid showing of their feathered friends and all the public men from the Governor of the Colony down, take an active interest and encourage with their patronage any progressive movement that the good people of the Colony may stage.

Prof. Landry had judged at the St. John's Poultry Show on a previous occasion and received many expressions of welcome from friends made on that occasion.

We were interested a day or two ago in a personal letter sent to Prof. Landry, giving details of a poultry show just recently held at which Frank E. Jackson of North Sydney was the official judge. The letter in question shows that the Newfoundland poultry men are still going strong. It also shows that the assistance given by Prof. Landry in past years is much appreciated by all classes in the Ancient Colony.

Prof. Landry must pardon us for making the following extracts from a personal letter.

"The Seventh Annual Exhibition of the Newfoundland Poultry Association took place in the new Mon's building, Queen St., on the 26th, 27th. 28th of November, and was opened by His Excellency the Governor and Lady Harris, and was in fact the most successful exhibit held by us. The attendance was upwards of 3000 people, and from all accounts they were pleased with results and interested throughout.

We had an unusual visitor at the show this season, a Camel, "Dr. Campbell, our new Minister of Agriculture," and the response he received from the "high fliers" fully justified the encouraging words he said about them. The Governor and our new Premier addressed the gathering, both of whom were accorded a cordial reception.

No doubt you have often heard of a live wire in poultry matters, and if one exists in Newfoundland, it is in the person of our energetic Treasurer, W. R. Beetle. To him we owe much of our success in getting off our annual show this season, for he has given every moment of his time in making the exhibit as attractive and interesting as can be.

He has been very successful at the Exhibition and I feel sure every person of the Association is delighted that he has met with such success in the past as well as the present. This year the management of the Show was left entirely in his hands, and the manner in which he conducted the work and attended to a score of details connected therewith, places him as the only show manager we have in the Association that "Confidence and Ambition" is his unbounded desire. May the day be far distant when we will lose the services of W. R. Beetle from the management of the Exhibition or from the Association in any form.

From a general make up we have a splendid class of poultry enthusiasts that can be found anywhere, and in this connection I do not think it would be amiss to mention the name and person of Mr. G. R. Williams. You have often heard it said that "ones face speaks for itself." It is so with G. R. Williams.

It is a face of straightforwardness, honesty, and one possessing rare qualifications and high ideals, a gentleman in every sense of the word—that makes life easy to be in company with.

Then again, we all hold our dear old President in great respect and admiration, that no words of mine can fully justify his manly traits of character.

I am delighted to say that every one was pleased with Judge Jackson, and I feel sure his awards were well and truly placed. Unfortunately I happened to be away from the Shop when he called to see me on his departure, for I would have wished to bid him farewell and may we meet again. He is a fine, interesting fellow and we liked him well.

Your letter of the 11th inst. received today, and I am deeply grateful for words contained therein, as also for the photo of the Laying Contest pens, and for placing my name upon the mailing list of the Weekly Egg Laying Contest, which is of vast interest to our welfare. I assure you, my friend, that I appreciate it most thoroughly and no doubt our friend, Mr. Williams, as well as the general run of boys interested in poultry. My good wife requests me to say that Mrs. Landry and yourself are welcome to remain with us if at any time she or you care to take a trip to Newfoundland.

I am living in hopes that this Egg Laying Contest will be over by the time we will be enquiring about a judge for our next years Exhibition.

Personally, I am longing to see you again, and I feel sure the boys will be thoroughly charmed if it will be your good luck to come and judge our Show next year. So please bear it in mind and do your very best to be with us, as we will surely bid you welcome.

By the way—how many birds are in each laying pen?

Enclosed you will find full list of winners and a slight expression on the various classes competing.

I will take up the largest class first and continue along accordingly.

Rhode Island Reds

The Rhode Island Reds was the largest class about 67 birds, and a mighty hard contest took place between our much respected President, Mr. LeMessier and our energetic Treasurer, Mr. Beetle. The 1st cock was a bird of good display—rich in surface and under color, with a good head, long body and being of extra size and shape. The first cockerel gives promise of something good, rich in surface and under color, large and of good shape, and when matured will show to greater advantage.

The hens were of fine type and color, so also were the pullets. The pullets were a credit to any show and were easy winners. It was first thought that Mr. LeMessier and Mr. Beetle would tie for the Cup, but the report showed that Mr. Beetle had wone by "one point" and thus secured the Cup for the second year.

The former holder, Mr. Emberley, took his defeat in a manly way, having had it for two years, so next year will witness a keen competition between the three mentioned gentlemen. It may be possible that a dark horse will step in next year, as was the case in the Barred Rocks. Mr. Beetle and Mr. Emberley have now two years service each on the Cup and a win for either of them next year will acclaim the side ownership.

Barred Plymouth Rocks

The second largest class were Barred Rocks and brought out some very fine specimens. We are delighted to note the improvement in this variety of recent years, and future exhibitions will bring this noble bird in much more prominence in shape and quality than heretofore exhibited.

Mr. Chancey from Grand Falls came in with a fine string of birds and barred the two year holder of the Cup, Mr. Duff, from final ownership. This will assure us of another hot contest next year and every effort will be made by each competitor to regain their former position. Thus the Barred Rock Cup leave the City to adorn the surroundings of Mr. Chancey's home, in honor of his winnings at the Newfoundland Poultry Exhibition.

White Orpingtons

The quality of White Orpingtons exhibited by Mr. Williams and Mr. White were a credit to them in every respect and would hold their own in many exhibitions. In the class of "hens", Judge Jackson remarked that every bird was worthy of a prize. It was with the greatest difficulty that he placed his awards in this class, so alike were they in every particular. The palm, however, fell to our genial friend, Mr. Williams, who captured the Cup for the second year. His remarkable winnings are worthy of comment, for when a person can capture nine prizes out of eleven, it is a conclusive proof that he handles goods of quality.

It was my pleasure to witness Mr. Williams' first exhibit, and the improvements he has made during the last few years, speaks in glowing terms of his ability in knowing how to breed for the quality thus displayed.

The Orpingtons and White Leghorns exhibited by him were beautiful in extreme, and great credit and every success is due him for which he has fought and honorably won.

Although he has lost the Leghorn Cup this year, I feel sure he will take possession of it next year without the slightest trouble.

The Second Prize Hen won by Mr. White, was a bird of exceptional quality, and strongly commented upon by Judge Jackson.

White Leghorns

You will be surprised to witness the improvement in this grand little variety. After a very hot contest between Mr. Williams and Mr. Perry, the honors fell to Mr. Perry, and thus captured for the first time the much sought for Silver Cup. Mr. Perry is quite proud over his success, and remarked (with a thump) that he was 7 years after the owner of the birds and the prepared, (meaning myself). However, Mr. Williams, did not envy him his success, and I can assure you, Sir, there are few exhibitors that can take a defeat in man fashion like the genial G. R. Williams.

Mr. Perry might just as well cherish that Cup as often as he can during the year he holds possession of it, for as sure as the sun shines, I hardly think it possible he will win it another year.

The cockerels in this class were exceptionally good, beautiful in shape and color, and fit to represent any poultry show.

In the pullet class I would consider them somewhat below tsandard requirements, but for shape and color were exceedingly good. I would like to point out a thing or two in this particular breed, but further thought would be better displayed in putting it into affect in the show room.

White Rocks

The exhibit of White Plymouth Rocks was comparatively a small class in quality and numbers, and not by any means compared to former shows.

It is regrettable that this noble bird —the bird of distinct shape and beauty —was not so well represented, for there is no bird that ever adorned the walls of any poultry exhibit that can show to the advantage as the White Plymouth Rock.

If possible I will endeavour to enter the arena again next season, and bring in prominence those beautiful specimens which has heretofore pleased your exacting eye.

White Wyandottes

We deeply regret the small representation in this good all round bird. and one of the most attractive show birds there is in existence.

Although small in number, the class brought forward some fairly good specimens in hens and pullets. We predict next season will bring more interesting competitors into this breed that will place them in the forefront to which they are so well deserving of.

The balance of the classes were not so well represented as they might

Royal Purple Stock and Poultry Specifics and Foods

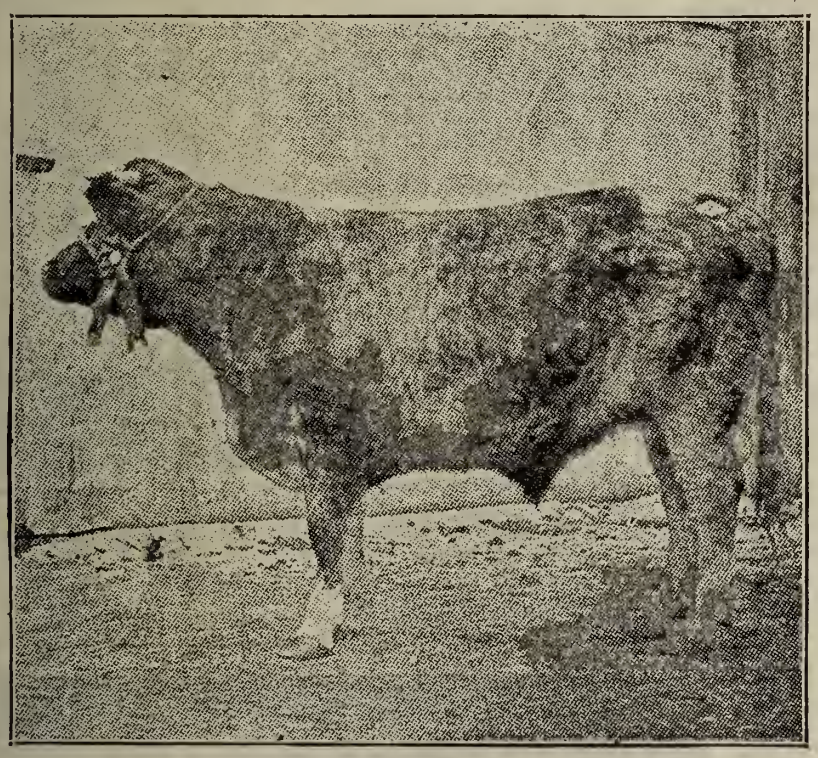
In the manufacture of all our Stock and Poultry Condition Powders and Remedies we eliminate the cheap filler which is used by many manufacturers to make up a large package, and give you pure material which you can adulterate yourself if you wish. Mr. Farmer, how does this appeal to you?

Royal Purple Stock Specific

is a pure unadulterated condition powder, it is not a dope. It can be used throughout the entire feeding season and will not do your animals one iota of harm, works entirely on their digestive organs, causes them to assimulate the foods properly and digest every particle of food value. Fifty-five to sixty per cent. of food value is a fair average of what the animal takes out of its food without this condition powder: it makes their coats sleek and causes them to take on a healthy appearance in a very short time.

What We Claim For It

Cows will give from three to five pounds more milk per day during the winter months. You can fatten pigs a month earlier, have larger and better pigs and save a month's time and feed. You can fatten horses ready for sale in four to six weeks. If you don't believe us try a 60c package on the worst animal you have on your place and be convinced. How many times have you said to yourself, "No matter how much I feed my animals they do not seem to thrive." This, Mr. Farmer, is because your animals are not in a healthy thriving condition. Royal Purple Stock Specific will compel them to put on a thrifty appearance in a short time and yet it will cost you less than 15c. per month per animal to use it. Put up in 60c. packages, $1.75 and $6.00 tins. If you have a lot of stock buy the large tin. It contains sixteen 60c. packages.



PURE BRED STEER under 1 year, entered in Lot No. 3, Toronto Fat Stock Show, Union Stock Yards, Toronto, Ont., Dec. 11-12, 1919, and awarded 1st Prize. Also entered for Royal Purple Calf Meal Special, and awarded 1st Prize. Fed and Exhibited by Mr. Oril Williamson, R. R. No. 1, Jarvis, Ont. Sold for 33c. lb. by Auction. Weight, 1190 lbs.

Royal Purple Laying Meal

During the many years we have been making our high-class Stock and Poultry Specifics, we have had thousands of letters from Poultry raisers all over Canada, wanting to know what to feed their poultry. A hen is just like a factory. If you have lots of material in your factory, you can get out the finished product. The hen requires so much Protein, so much Fat, Ash Lime, etc., to make an egg and supply her bodily needs. Ordinary grains will give her a supply for herself and to make one egg every two to three days. For the accommodation of our customers, we have produced a Laying Meal which contains high-class meat meal, grains, etc., that will give her everything she requires for her bodily needs and produce an egg per day. If you cannot get this material from your dealer in your own town send us $5.00 for a hundred-pound bag and we will ship it to you direct. This product certainly fills a long felt requirement for the poultry man and simplifies the matter of feeding.

MANUFACTURED BY

W. A. Jenkins Mfg. Co., Limited

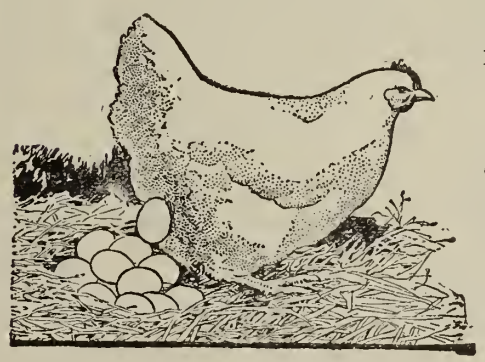
LONDON, ONTARIO

Royal Purple Calf Meal

There is probably no mixed feed on the Canadian market that the farmers have been buncoed more on than Calf Meal. You cannot make a substitute for milk with less than 10% Fat or over 20% Protein. Calves are entirely different from grown animals. You must supply them with material as much like milk as possible. In our Royal Purple Calf Meal we have a product on which you can raise calves after they are eight days old just as well as though you used new milk. At the Toronto Fat Stock Show this year there were eight calves shown not over a year old that averaged over one thousand pounds each, that were fed on this meal. If you will write us for our new booklet we will send you the full particulars and photographs of all these calves. Mr. Farmer, when you want calf meal you see that it contains over 10% Fat. Unscrupulous dealers and manufacturers are making meals that do not contain more than 7% fat and a large percentage of protein. Many of these meals are no better than ordinary dairy feeds. Fat costs two and a half to three times as much as protein in any market, but you must have it in calf meal to make a substitute for milk. Our Royal Purple Calf Meal is put up in 25, 50 and 100-lb. bags.

Royal Purple Poultry Specific

If your hens are not laying after the first of January it is because they are not housed properly and are in an unhealthy condition. There is no excuse for hens not laying if they are fed and housed properly. Our Royal Purple Poultry Specific, if used in the mash given them, will make them digest their food properly, make their digestive organs healthy and active and will produce the eggs for you as well in the winter as in the summer. The eggs are formed in batches from ten to fifteen, from the large egg down to the size of a pin head. If the hens are not healthy nature will lie dormant. As soon as our Poultry Specific is used nature becomes active. This is why so many people get eggs in a few days after using our Specific. If you do not get eggs it is your own fault. This Specific is put up in 30c and 60c packages $1.75 and $6 tins



Royal Purple Chick Food

made from all kiln dried white grains. You can raise 95 to 98% of your young chicks with this food, put up in packages and bags.

We also manufacture the following valuable brands:

Royal Purple Lice Killer in 30c and 60c. tins.
" " Cough Cure in 60c. tins.
" " Sweat Liminent in 60c bottles.
" " Disinfectant in 35c., 65c. and $1.40 tins.
" " Roup Cure in 30c. and 60c. tins.
" " Worm Powder in 30c. and 60c. tins.

Every article we make is guaranteed to do exactly as represented.

For Sale by reliable dealers everywhere. If you cannot get any of the above articles from your dealer write us direct.

FREE Write us and we will send you one of our new books that are now being published, giving you all the common diseases of stock and poultry, how to treat them how to build a hen house, and wilderness of valuable information.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to houschold science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

MEN AND MONEY.—A STORY WITH A PURPOSE

(Continued from last issue.)

The Browns, like other people, had dissensions and mutinies at times within their ranks. No four healthy people ever lived together in perfect harmony for an indefinite period, and the number could be lowered again, and yet again, without upsetting the truth of the statement.

To try to bring about harmony, Mrs. Brown had made it the rule to have Saturday afternoon a free time for the boys, but sometimes, by failing to do the work on Saturday morning, Saturday afternoon had to be broken into by unfinished businesss, and this was the cause of the frown which hung heavily on Tom's face, as he put strings on the sweet peas in front of the house.

"We've got too many flowers," he said grumblingly, "they always need to have something done to them. I like flowers that just grow, and look out for themselves—without bother to anyone—and spoil all his fun. If we hadn't any; I'd have more fun."

Mrs. Brown was cleaning the veranda, and his remarks were addressed to her.

"That's so, Tom,' she agreed, "and if we didn't have the veranda — I wouldn't need to clean it, and if we didn't have any clothes I wouldn't need to wash them, and if we didn't have anything to eat, I wouldn't need to cook, and then I wouldn't have to wash the dishes. We're certainly in hard luck having so many things, you and I."

Tom worked in silence, thinking of what she had said, but his heart was with the gopher hunt.

"There are lots of the boys who never has a thing to do. Joe Peters has no cow to feed, or hens to look after, and they never bother with flowers. They just go out riding in the car every night, and I wish we were like them. The boys don't even need to go to school if there's anything else they want to do. Their house doesn't look nice, but they sure have fun."

Just then, the afternoon mail came in, and in it there came a letter to Mrs. Brown from home. It was from her mother, and, as usual, she seized it with delight.

"Dear Stella,' 'it began, "we had a family gathering today, and we had every member of the family but you, and so we have decided that we really must have you at the next one. You have been gone for fourteen years now, and you have not been home even once, and now we want you to come to us for at least a month. Your boys are big enough to leave now, and we know that Billy has always wanted you to have a holiday, but you are so conscientious about doing your duty to the boys, that you forget to do your duty to yourself.

"Now let me tell you what we have to offer in the way of inducement.

" We will all be here; father is very well this summer, and greatly enjoying his new Ford. He will take you all over to see the friends. The brothers and sisters are all wanting you, dear Stella, and they are full of plans for giving you a great time. The cotn will be ready then, and I hear talk of a great cornbake in the maple-bush, the first night you are here. The woods will be beautiful in September when the maples and the beeches begin to turn."

Mrs. Brown had sat on the veranda step to read her letter and at this point in the reading,a cry broke from her.

Tom ran to her at once—"Mother," he cried, in alarm—"what is it?"

Never in his life had he seen his mother cry.

She was herself again in a minute.

"It's nothing at all, Tom," she smiled—"only I just got homesick for a minute. Your grandmother wants me to come back home, and of course, I can't because it would take too much money; but I got lonesome for a moment, and I wanted to see the apple-trees and the plums that I planted, and I wanted to see the milk-house with the stream running through it, and the hollyhocks and hydangeas, and I wanted most of all to see mother and father and all of them. But I couldn't leave you and John and Daddy here all alone, even if we had the money, which we haven't, but we'll have lots of it when you and John are through school, and then we'll all go and see the old folks, and we'll stay a year, and motor all over Ontario in our Studebaker—and—"

The tears were still hanging around his mother's gray eyes, and Tom could feel them, although they were not visible.

He went back to the sweet peas, and soon had them all provided with good supports.

When he came into the house, his mother, shelling peas for dinner, was singing as usual.

"Mother," he said cheerfully, "is there anything else I can do? I don't mind work—I'd rather work, and I'm not going out with Joe Peters at all this afternoon—I want to stay with you—I'm sorry you can't go—but I'll hurry up with school—and we'll soon have lots of things."

"We have lots of things now, Tom," his mother laughed happily. "We have health, and each other—and lots to eat and enough clothes, and a good school for the boys, and I'm very happy. When we go home we'll all go, I couldn't go away for a month and leave you two boys. I would be thinking all the time that your knees were out, and you had forgotten to wash behind your ears, and had gotten into poison ivy for something. O! I am not homesick now, Tom, I am just thinking what a great time we will have when we all go back home to see our folks and your Daddy's people,and how proud I will be to show my two boys."

John and Tom Brown went through all the grades in the Public School, and when they entered the High School their record was something of a triumphal progress. They were able to take their matriculation from the High School, and then came the first real break in the family, when the boys went to the city to begin their college work. John was ready one year ahead of Tom, but he taught a year to help the family finances, and to let his brother catch up to him. The city was only fifty miles away, and the boys came home each week end, on their bicycles, in the sumer time.

In May, 1914, when the University reports came out, it was found that the one hundred dollar scholarship had been awarded to John Brown, and Tom had taken the second one of sixty dollars. Both boys were at home when the reports were published, and the little house, in need of repairs, fairly throbbed with delight. Mr. Brown brought the paper home at noon, and laid it on the table before his wife. The headline told the story.

"Brown brothers take first and second scholarship for proficiency," it said.

"The returns are beginning to come in, Mother," said John, with a smile, as he kissed her.

"Boys," she said, "the returns have always come in. I got my reward every time either of you gave me a smile—or a hug and every time I heard you laugh, every time I saw my boys learning how to do their part in life—I was repaid a hundred times. Your father and I have had a great time raising you two big fellows—you've kept us young, and well, and happy, and now you're bringing our rosiest dreams to pass. Talk about returns, Here!" And she kissed both boys and put the loudest kiss of all on her husband's bald head.

"Billy—old man—what sort of a time have we had—raising these two boys?"

"The very best," he cried, "the very best!"

That was in May, 1914.

In August came the war!

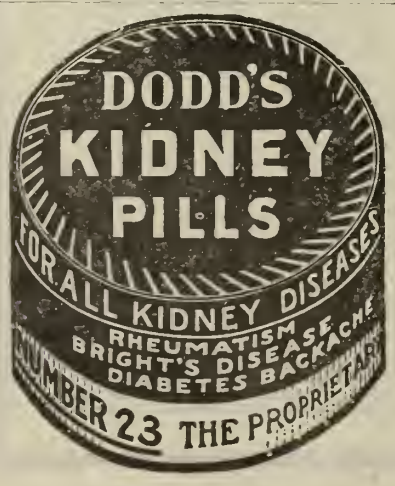
At first no one believed that a real war had come; the time had gone by. It would be settled. The little groups of men who gathered on the street corners were unanimous in predicting that it would all be over by Christmas.

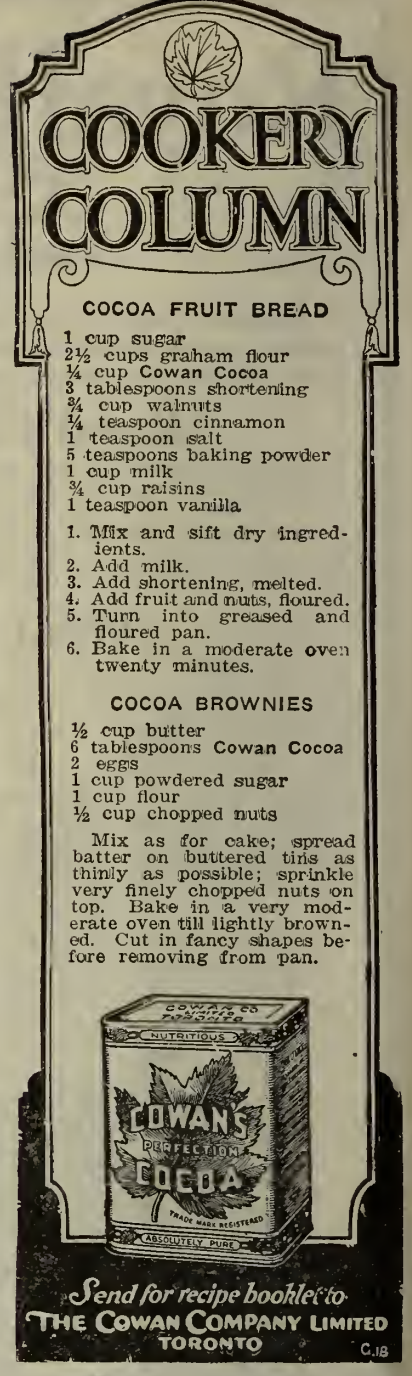
Every day, Billy Brown brought the paper home, when he came for lunch, and it was an excited group that read the war news, and traced on the new war map, which an enterprising newspaper had sent out, the places mentioned in the reports.

When the neighbors light-heartedly discussed the war, predicting its early and successful ending, Mrs. Brown was silent and absorbed. One awful possibility held her heart in its cruel grip, and darkened her days with fear.

They might have to go!

There was no thought of conscrip-





COOKERY
COLUMN
COCOA FRUIT BREAD
1 cup sugar
2½ cups graham flour
¼ cup Cowan Cocoa
3 tablespoons shortening
¾ cup walnuts
¼ teaspoon cinnamon
1 teaspoon salt
5 teaspoons baking powder
1 cup milk
¾ cup raisins
1 teaspoon vanilla
1. Mix and sift dry ingredients.
2. Add milk.
3. Add shortening, melted.
4. Add fruit and nuts, floured.
5. Turn into greased and floured pan.
6. Bake in a moderate oven twenty minutes.
COCOA BROWNIES
½ cup butter
6 tablespoons Cowan Cocoa
2 eggs
1 cup powdered sugar
1 cup flour
½ cup chopped nuts
Mix as for cake; spread batter on buttered tins as thinly as possible; sprinkle very finely chopped nuts on top. Bake in a very moderate oven till lightly browned. Cut in fancy shapes before removing from pan.

tion by the State, but there is a more inexorable law than was ever written down in cold type, and it was that law which was now driving the gladness and joy from the heart of many a man and woman.

It is the low of conscience—the conscription of conviction.

Somtimes it comforted and reassurred her to watch the men who walked the streets, the men who were older than her boys, and yet unencumbered with family cares, and apparently idle. Surely they would go before there was a call for boys at school. She tried to think of the thousands and thousands who, all over the British Empire, were hastening, at the call. Hers would not be needed. Indeed, she said to herself, there would not be training schools enough to train those who were offering themselves; there would not be a call for men, when there were no facilities for training them.

And besides, it would soon be over.

The boys went back to college when the Fall term opened, but their week-end visits had lost all their joyousness. They talked of nothing but the war! Recruiting officers had come to the college, and urged every boy over eighteen to enlst.

"Why don't they go to the barrooms and pool rooms?" Mrs. Brown cried indignantly. "Why do they not make their speeches to the idle men on the street corners. . . . ."

"This isn't a job for pool-room loafers, Stella," said Billy Brown, gravely, "this is going to take the best we have, and I'm afraid—all we have."

This was the first time he had admitted his fear that the war would be a long one, and there was something about his words that fell on her heart like the clay on a coffin.

The thing she feared, had come—Billy ha dadmitted it——

But it was like her not to cry out or complain. There was no outward manifestation of the storm which swept over her soul, except that as the days went on, her face seemed to shrink and wither.

The Brown boys enlisted in December, 1914, and went to Montreal for their training. The morning they left the station was packed with people. Six other boys went with them, all under twenty-three years of age.

Some of the neighbors said they thought it queer of Mrs. Brown to go to the station. The neighbor who lived in the house next door, who had no one to send, was perfectly sure she could not have gone, if it had been her two boys who were going away. She was too sensitive and full of imagination. But some people, she agreed, were not so fine in the grain, and it was well for them.

It was a dull winter morning, with a cloudy, red sunrise, and deep white frost on the trees, when the boys went away. A winter morning before sunrise is always dull and shivery, and does not make for cheerfulness; but there was no voice steadier than Mrs. Brown's when she said goodbye to her two boys.

Mrs. Wilson noticed how she trembled, when she helped her into the back seat of their car, but it was not Mrs. Brown who was crying as they rode together on their way back from the station.

Mrs. Wilson did not try to frame any casual word of sympathy as she watched her friend, in deep admiration. At the top of the street they stopped to watch the train as it throbbed its way across the prairie. The smoke wreath lay against the sunrise, and was touched by the first beams that come over the edge of the earth.

"There's nothing more beautiful than smoke!" said Mrs. Wilson absently.

Mrs. Brown did not hear her. Her eyes were fixed on the disappearing train, and her ears were strained to catch catch the last echo of its strident whistle.

When it was gone from her view, something like a sob broke from her, but she sat very straight, and her voice was steady when she said, as if to herself—

"It seems right that they should go together."

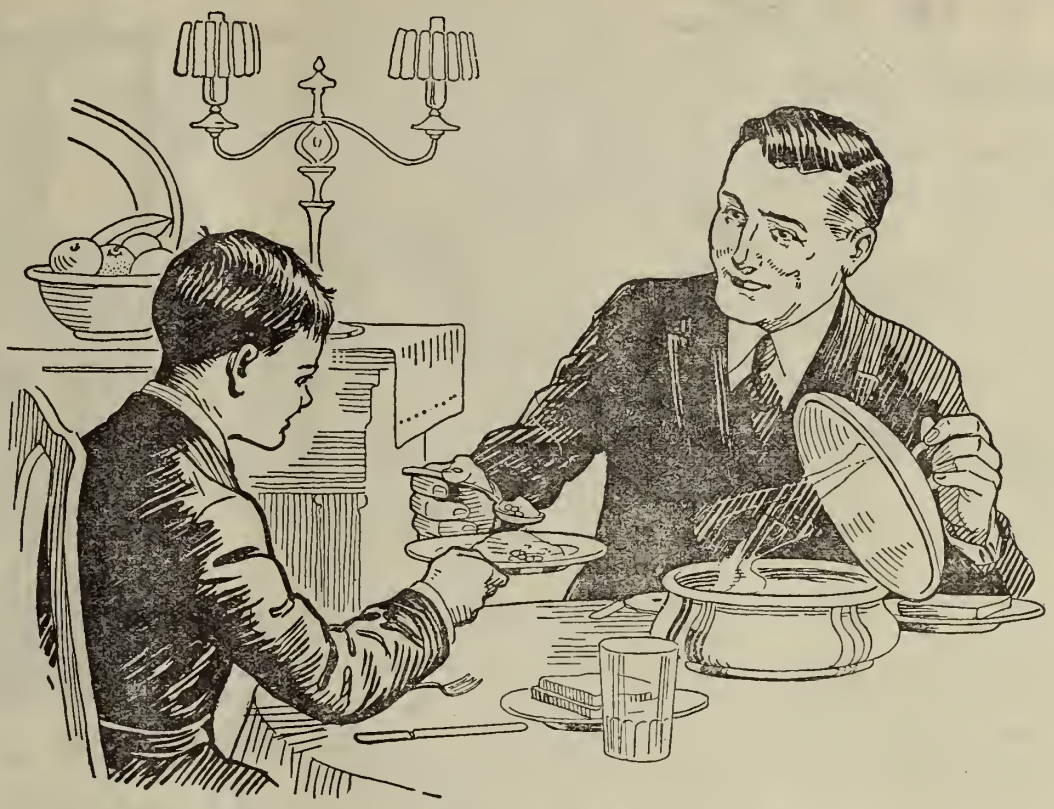
In the front seat, Mr. Wilson was speaking.—

"Brown, I congratulate you with all my heart. It's a wonderful service, to fight for the liberty of the whole world, when a terrible danger threatens it, and you're able to send two men to fight for all of us. I'm not going to tell you I sympathize with you, —I don't, I envy you—and I'm very humble, in your presence."

'Billy Brown's face was pale and twitching with many emotions, but he made no reply. He probably did not hear what the other man said. There was a little scene being enacted in the dark recesses of his memory, and he saw himself opening the door of his house and calling:

"John Brown!"

From a litter of homemade toys he saw his eldest son, in a blue romper suit, with a tangled head of yellow curls, rise to his feet, and placing



"I Am Glad to See You Pass Back, My Boy"

"WELL, I'm hungry."

"Good. It is a long time since I knew you to be hungry, unless it was for candy or some fancy dishes."

"Guess you are right, Dad."

"And what makes you so hungry?"

"I don't know, unless it is the Dr. Chase's Nerve Food mother is giving me."

"Something is making you look better, anyway; you have more color and seem to have more snap about you. Have you been weighed lately?"

"Yes, I have gained six pounds since I began taking the Nerve Food. Mother weighs me every week."

"That is fine. Now I hope you will be able to do better at school. I would like to see you at the head of your class or near it. I guess you did not have a fair chance before. You were half starved and we did not know it."

"That was no fault of yours, Dad."

"Perhaps not, in a way, for there was always plenty to eat, but the trouble was we did not see that you got what was good for you, and you got away under weight."

"One thing certain, I am feeling a lot better now, so I guess it must be from using Dr. Chase's Nerve Food.

"Yes, we shall give the Nerve Food credit for doing a whole lot, for I am sure you would never have gained up so quickly without it."

"Who told you about it, Dad?"

"I read in the paper that one boy in every three was under weight from malnutrition, and that was why so many boys were nervous, irritable and backward at school. Then I began to think about you and decided that you were not having a fair chance."

"You will not need to worry about me any more."

"No, I hope not, and I am going to warn other people of the risk they are running of having their children becoming physical and nervous wrecks for lack of proper nourishment. You had better go out and get some fresh air now before dark."

In order to be sure of getting the genuine Dr. Chase's Nerve Food it is only necessary to see the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, on the box you buy. 50c a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Ltd., Toronto.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

Mrs. M. Summers, Box 309 Windsor, Ont.

Hot Flushes, Fainting Spells.

So Weak and Nervous Could Not Sleep.

Mrs. Philip H. Ryan, Sand Point, N.S., writes:—"I have been a great sufferer from nerve trouble. I was so weak and nervous I could not sleep at night, and my appetite was very poor. I could not walk across the floor without trembling all over. I had hot flushes and fainting spells. When I was on my second box of Milburn's Heart and Nerve Pills I began to feel better and kept on until I had used six boxes when I felt like a different person. I am never without them in the house and recommend them to all who suffer with their nerves."

Milburn's Heart and Nerve Pills are 50c per box at all druggists or dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

his little heels together, and lifting one plump pink hand in token of salute, answer:

"Present."

"They have answered the call," he said brokenly. "They have answered!"

It was a lonely house when the boys were gone, although Mrs. Brown did not spend a moment in idile grieving. She went bravely to the boys' room that afternoon ,and carefully put away all their things, sometimes pressing a kiss on a cap or coat.

Her neighbor across the fence ran in to see her that afternoon, and found her in the midst of her work. She took it as a further proof of Mrs. Brow's lack of sentiment. "She never seems to think anything will happen, and actually talks of when the boys come home. I can't understand a mother being so composed at a time like this. And she's going to take boarders! I would have thought she would want to keep that room just as the boys left it, with everything in it to remind me of them. I know ifit were my case I couldn't bear to touch a thing. But then—every one isn't like me!"

By her efforts in keeping boarders Mrs. Brown was able to supply her two boys with many comforts, and the thought that she was able to follow them, with the ministry of her love, comforted her in many a tragic moment, when the horror of it all seemed more than she could bear. The nit was that, to keep the biitter waters from going over her head, that she sang as she worked, sang—to keep herself from thinking—and her neighbor, hearing her singing, wondered at her lightness of heart. She forgot that people sometimes whistle going past a graveyard, and it isn't because they are light-hearted, but only frightened.

When the First Victory Loan was launched, there were many reasons why Herbert Wilson was made the Chairman of the Committee. He knew the business men: he had time: he had enthusiasm: he was a good speaker: he was a heavy subscriber.

His first addresss made a great impression.

"I have, unfortunately," he said, "no one to send"—and his voice trembled with deep emotion. "I am one of those, whose life has not been blessed with children—but I will fully, freely, gladly give myself and of my means, to the cause of human liberty!"

To the first loan he subscribed twenty thousand dollars: His picture was published in the city papers: A large poster hung in the plate-glass window of the drawing room in the big house!

The war is over now. The Armistice is signed. The nations are explaining!

If this were a story—a piece of fiction—a romance—I would give it different ending!

But it was not my story, and I have no option.

It was in August, 1917, when the sweet peas were spilling their perfume all over the garden, and the tomatoes were turning red upon the vines, that the news came!

Mr. and Mrs. Brown had come in from church, and were getting dinner as usual. Two S. O. S. boys, working on farms near by, had come home with them for dinner, and to them Mrs. Brown was telling an episode in Tom's life, when he had run away to the swimming pool, and some of the boys had stolen his clothes, an dhe had to stay hidden until it got dark enough for him to make his way home unobserved, and how he had dressed himself in his best suit, and gone out to find the gang who had robbed him.

They were laughing so much, they did not hear the door-bell, and the boy with the telegram came around to the back door.

The telegram regretted to inform them that Private Thomas Brown had been hit by a piece of shell and instantly killed on August 1st.

The next Sunday the other telegram came. It regreted to inform them that Private John Brown had been hit with a piece of shell on August 8th, and instantly killed.

In the front window of the small house, still in need of repairs, the scarlet leaves of the Service Flag have been changed to gold. A small woman, whose hair is all gray now, goes softly about her work, often stopping absent-mindedly, as if she were listening for some sound which she does not expect to hear. The springiness has gone from her movements, and the neighbor across the fence says Mrs. Brown is "ageing." But she still has a smile when her husband comes home, and to him she often says: "It seems right that they should go together!"

At the desk in the inside office of the implement house, Billy Brown still keeps the accounts of the firm. People say he bears up wonderfully well. Sometimes when he is all alone, his shoulders sag a little, and he has been knwn to talk to himself, generally, just a word, a name, "John Brown!" he whispers. . .. and then away back in the garden of memory he sees a chubby fist go up; he sees a sudden flash of blue eyes—and a toss of golden curls—and then he hears a childish voice make answer:

"Present!"

"They did not fail," he whispers—"when their country called—they answered."

He is not unhappy, for the past has its pleasures too, as well as the present.

The asigned pay ceased when the boys were killed; and there are no pensions paid, for their mother is not a widow, neither were they the sole support of anyone. There came, however, from the Department at Ottawa, two typed letters, just alike, expressing polite sorrow!

The Wilsons have enlarged their house again, and Mrs. Wilson has her own car now. Why not? The money which they loaned their grateful country, has been a good investment. It pays five and a half per cent. interest, and is free from taxation. Twice a year the cheques come, which speak a nation's gratitude.

For the loan of money our Nation is very, very grateful. It is only the gift of men, that is forgotten!

Gets Instant Relief After Four Years

TORTURED WOMAN TRIED DODD'S KIDNEY PILLS

Kidney Disease and Insomnia Had Made Her a Nervous Wreck Till She Used Dodd's Kidney Pills.

Dunvegan, Inverness Co., N.S., Feby. 1st—(Special).—Women who are dragging wearied limbs around, weighed down with a suffering and tiredness that can find no rest, will find sunshine and hope in the message Catherine McPherson of this place sends to them.

"I have just used one box of Dodd's Kidney Pills," Miss McPherson states, "But they did wonderful good for me.

"For nearly four years kidney disease tortured me. It finally developed into diabetes. I became a nervous wreck and insomnia was added to my troubles. I was so weak and tired and irritable that every trifle added to my discomfort.

"Dodd's Kidney Pills gave me instant relief. They are a wonderful medicine. I shall recommend them to all my friends."

Dodd's Kidney Pills are purely a kidney remedy. They put the kidneys in shape to strain all the impurities out of the blood. That's why they bring health and restful sleep in their train.

Sold throughout the wholesale trade only.

KNITTING MACHINES FOR MONEY MAKING HOME, & RED CROSS WORK
Catalog free. CREELMAN BROS., Mfrs., Box 818 GEORGETOWN, ONT.

VALENTINE COOKIES

Small cakes appeal to the hostess who at this time of year wishes to carry out especial ideas in design and color schemes for her social functions and she may, with a small outlay of time or money, produce innumerable concoctions of fascinating shapes and appetizing flavors. They may be made in the shape of hearts, darts, Cupid arrows, and love wands, either by baking in the little fancy pans that are sold for such purposes, or baked in a thin sheet and then cut to suit individual fancy. The manner of icing then depends, of course, upon how they are to be served.

Maple Jumbles

These are made by mixing thoroughly two cupfuls of sugar, one of butter, one of sweet milk, four of flour and three teaspoonfuls of baking powder. Drop from a large spoon on butter tins, thickly sprinkle with grated maple sugar and bake.

Hearts' Delights

A sweet which is unexcelled for tea. Boil a cupful of confectioners' sugar and half a cupful of water until it breaks when dropped into cold water. Then beat in the stiffly beaten yolk of an egg, add a cupful of dried currants and one of minced nut-meats; beat to a stiff frothy paste spread on heart-shaped crackers and brown in the oven.

Love Puffs

The whites of six chilled eggs and a pound each of sugar and walnut kernels will make quite a number. Beat the whites of the egg to a very stiff froth, gradually add the sugar, then the nuts; drop on greased paper and bake forty minutes in a slow oven.

Dice Wafers

Take the whites of ten eggs, one and a half cupfuls of sugar, the same of flour and a teaspoonful of baking powder. Beat the whites stiff, sift the flour, sugar and baking powder together four times and stir lightly into the eggs. Flavor with orange and bake in a long, shallow pan, and afterward cut into squares. When cool, ice, flavoring the icing with orange, and, while soft, dce with English walnuts.

THOSE WHO COME BACK

(Concluded from last issue)

Those who come back have acquired unconsciously, too, a wider vision and what may be termed a broader culture. They have looked out on wide horizons. They have rubbed shoulders with the world. The great majority of those who have returned would never in the ordinary course of peace events have crossed the Atlantic. Many of them had never before been beyond the borders of their native village. It has meant a wider vision to have walked in Westminister Abbey, or to have stood in the stillness of the Colosseum, or to have looked in silence upon Napoleon's tomb. It has meant a different outlook even to have rushed with the crowds in Picadilly, to have strolled down the Champs Elysees in the golden Paris afternoon, or to have watched the swans and the play of foreign children in the Tuileries Gardens or the Bois de Boulogne. It has meant a broader citizenship to have visited the home of his ancestors among the heather in the Highland mists or on the English downs, or on the green hills of Ireland, or on the flowered slopes of Normandy. He will not love Canada the less as a result. He will have a greater realization of the toil and the adventure and the great vision of his ancestors in the making of his new country. And he will have greater pride in his home land. He will realize more deeply then before his country's kinship with the world, her duty to humanity, and the meaning of her place in the League of Nations,—a place which he himself has helped to give her. He will realize more fully too, that the hope of his ancestors in their great adventure has not been unfulfilled.

Those who come back are changed, too, in other ways; they are greater and better in spirit than when they went away. The war was more than the "great adventure" it has so often somewhat flippantly been termed. It was likewise the great test of men, the fire in which men were tried. In the past we have perhaps known all too little of the fine qualities of our youth, even in the communities where they resided. The war has emphasized or disclosed these qualities. It was the place of death, but it was also the place of opportunity. It sent away boys who came back men in other and better ways than years. It developed self-confidence and self-reliance; it taught patience and endurance under great trials; it necessitated quick decisions by young minds and the acceptance of great responsibilities by young shoulders; it instilled self-reverence, self-knowledge, self-control; these three qualities which lead in the end to power. It showed the weak his limitation as it showed the strong his strength. It always brought out the best if there was any best to bring out, but it was merciless, too, in magnifying weakness, perhaps by the laws of contrast. It would be absurd to say that the war improved every boy and man who went away. The truth of the old Japanese proverb, "dress a monkey in a soldier's uniform and he is a monkey still" had many living witnesses in the army, both at the front and behind the line. These "monkeys dressed as soldiers" were not in the ranks alone; some of them wore tabs. These are the men who hoped that the war would last forever, for there they were, like Shakepeare's clown, for the first and last time "dressed in a little brief authority." Now that the war is over they will sink back into the foilage of obscurity from which were it not for the social influence or political faovritism or the "old gradation" of rank they would never have been drawn. They should not be regarded as typical of the great body of our army.

What, then, will be the result in our national life by these home-coming men? What will be the influence on Canada of those stronger half-million men with their wider outloook on life, their tolerance, their broader culture, their new conception of Canadianism? This will be considered in a later article.—Major Cyrus MacMillan, O. C. 6th Canadian Siege Battery, C. E. F., in Canadian Courier.

Mother Meant What She Said

"What do you think of my bread, Mother?"

"Why, these loaves look perfectly lovely. Since you have a home of your own you have become a wonderful cook. I'm getting envious, Edna. Why, I believe I like your bread and biscuits better than my own!"

"Mother, you old flatterer!"

"No! I mean it. I've really never eaten better bread than yours."

"Well now, I refuse to take *all* the credit. I'll let you in on the secret, Mother. I use

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. Dr. Chase's Ointment will relieve you at once and as certainly cure you. 60c. a box; all dealers, or Edmanson, Bates & Co., Limited, Toronto. Sample box free if you mention this paper and enclose 2c. stamp to pay postage.

The publisher of the best Farmer's paper in the Maritime Provinces in writing to us states:

"I would say that I do not know of a medicine that has stood the test of time like MINARD'S LINIMENT. It has been an unfailing remedy in our household ever since I can remember, and has outlived dozens of would-be competitors and imitators."

Obstinate Coughs
Obstinate Colds

The Kind That Stick,

The Kind That Turn To
BRONCHITIS,

The Kind That End In
CONSUMPTION,

Become a Serious Matter
IF NEGLECTED.

All obstinate coughs and colds yield quickly to the curative powers of

Dr. Wood's
Norway Pine Syrup.

This old and well-known remedy has been on the market for the past 30 years.

You will find that a dose or two will stop the cough, soothe the throat and bronchial tubes, and if the cold has become settled on the lungs the healing properties of this famous cough syrup will soon bring complete and permanent relief.

There are many imitations of Dr. Wood's Norway Pine Syrup on the market. Get the original when you ask for it. Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

TILL THE DOCTOR COMES. — WHAT TO DO IN THE CASE OF EMERGENCY

Probably the difference which telephones and motor cars have made in our life has never been realized more gratefully than in case of some emergency when a doctor must be summoned as quickly as possible. But despite the aid which is so welcome and which only the rash refuse to use in any case which shows serious signs, there are certain things which we should know for ourselves and be prepared to do. There are times when even the most timely assistance is too late, and when life may depend on immediate and proper care. If the baby has swallowed the contents of a pill box, you can hardly afford to sit and look at her till the doctor drives out.

Then besides these rare emergencies there are those instances when a little care at the beginning when nothing serious is apprehended may save untold troubles later. If all cuts were properly dressed we would have fewer cases of blood poisoning. Again, even in cases of severe illness. it is not always possible to have a nurse and the home-maker must have a certain knowledge of how to care for her patient.

All told, both as regards previous measures and subsequent actions under the doctor's directions it is well to have at least a rudimentary knowledge of home nursing.

These ideas have suggested themselves upon the reading of a little book called the "Home Nurse," which has recently come to hand, and which seems to give in a simple and easily understandable form the chief things that should be known in regard to this subject.

A word of caution, however,. I have noticed a tendency among people to consult a book in preference to a doctor. This is the height of folly, and is, of course, in opposition to the spirit of this book, which, being written by a doctor, naturally insists on the part played of necessity by the physician in any illness. The book simply seeks to give guidance in those cases when the experience of the nures should supplement the wisdom of the doctor.

I have thought that it might be worth while to put in order certain things which should be remembered in regard to all illness and emergencies.

First of all it should be remembered that prevention is better than cure. This sounds trite, but as long as people go on taking mediciness in the dark, or leaving poisonous drugs within the reach of children, it must be repeated. It is really criminal to run risks in such matters.

Again, it is well to keep on hand a supply of the ordinary remedies which may be needed in case of sudden accidents. For example, a reliable disinfectant should be kept on hand to use in disinfecting cuts or wounds. Here are some of the commonest disinfectants:

Bichloride of Mercury or Corrosive Sublimate: This ih a powerful disinfectant, and is used in one part to a thousand parts of water. It is poisonous and decomposes metal therefore, it must be kept out of reach and should not be kept in a metal vessel.

Carbolic Acid: It is also a poison and burns readily. Its strongest solution in common use is one part to twenty of water. This is generally diluted to a third of its strength.

Peroxide of Hydrogen: This is a safe disinfectant, and may be readily employed. A three per cent. solution is generally used.

Boracic Acid: This is a weak disinfectant. It is used in a five per cent. solution.

So much for the disinfectants. In addition one should have on hand a supply of linen cloths, such as old handkerchiefs and the like which can be used for bandages. These can be sterilized by ironing with a hot iron or by boiling. They are the nsafe to use in the dressing of a wound.

A supply of obsorbent cotton, that is wadding which has been sterilized and treated with some disinfectant, should also be kept on hand. This can be bought at a drug store, and may prove useful. z

There are a few general principles in connectoin with the treatment of wounds or cuts swhich everyone should understand.

First, the cut must be cleaned. Many serious cases have resulted from a disregard of this rule. Too often the whole aim is to stanch the blood, and the wound is closed with flour or even cobwebs in seeking to do this. Such a treatment endangers infection, the very thing against which one should guard most carefully. The cut should be well washed even if it bleeds profusely. Boiled water should be used if possible, if not at hand, use the cleanest water that can be had. Bleeding can generally be prevented if the cut is in the limb, by tying a handkerchief tightly between the cut place and the heart. A disinfectant may be added to the water with which the cut is bathed. Any disinfectant, but salves and ointment should be avoided as they may close the wound and so shut in any germs which may still be lodged there. The cut should then be wrapped in a slean cloth, and it is probable that no further trouble will follow.

If the cut is a bad one, it may be necessary to use strips of plaster to bring the edges together. Of course, if it is very bad the doctor will have to be sent for to dress it and to put in stitches if needed.

If one's finger is pricked it is always wise to suck the spot at once. Poisons often enter the system in this way, sometimes through the most trivial causes. While one searches for a disinfectant any poison would

The Beginning of the Trouble

Is the Time to Stop it—And the Means of Stopping it are Provided by Dodd's Dyspepsia Tablets.

Have your meals become of interest to you simply because of the trouble they bring? Is your appetite gone? Do you get up in the morning with a dark brown taste in your mouth. Is your head muddled and sort of half aching? Is your day's work a burden? Do trifles worry you?

If you have any of these symptoms it is time to pay attention to your stomach. It has been overworked and needs help. Attend to it at once or you will drift into Indigestion, and from that to Dyspepsia. Help your stomach with Dodd's Dyspepsia Tablets. They tone up the stomach and bring it back to a healthy condition.

Mrs. Jos. A. Collet, Girouardville, Kent Co., N. B., says: "Two boxes of your Dodd's Dyspepsia Tablets cured me of Dyspepsia."

Dodd's Dyspepsia Tablets, 50c a box, or isx boxes for $2.50, at all dealers, or The Dodd's Medicine Co. Limited, Toronto, Ont.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home. without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis). irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day- trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 Windsor, Ontario

probably have entered the system, so the more homely expedient is in this case the safe one.

The bite of a dog should be touched with nitric acid or acetic acid at once. This presupposes, of course, that this is on hand for use.

Some one asked some time ago what should be done in cases of ptomaine poisoning. The best thing to do is to avoid getting poisoned. The housekeeper should be scrupulously careful in using canned meats to be sure that they are perfectly good. They should, of course, never be left in the can, but should be removed as soon as the can is open. No food should be served if there is even the slightest suspicion that it is tainted. These simple precautions go far to make ptomaine poisoning impossible.

If, however, it is suspected that such has occurred the doctor should be sent for at once. This is most emphatically a case for his need. Violent pains, accompanied by nausea and vomiting may indicate ptomaine poisoning. If it is thought that poisoning has occurred quantities of warm mustard water may be given to the patient, also a dose of salts. This is probably all that one can do until the doctor arrives.

Burns are of occasional occurrence in every household. When this happens the first thing is to stop the burning. For instance. if your foot was scalded you should thrust it into a pail of cold water ,as this will prevent further burning. Afterwards the foot and stocking can be cut away. Then the burn or scald must be dressed so that the air will be kept out. That is why oil is commonly used as the basis of all dressings for burns.

In every house there should be a bottle of linseed oil and another of lime water. These should be mixed in equal quantities and poured on the burn and on the cloths in which it is wrapped. Carron oil, as this is called will soon soothe the pain. It should be applied freely during the earlier stages of healing. Later a drying salve may be used, but soft salves such as vaseline should be avoided.

So much for some of the commonest emergencies; a word now as to one of our most ordinary ailments for which a doctor is as a rule not called. Colds probably cause more discomfort than any one other ailment. Habitual colds are also very dangerous, as they are apt to lead to the other more serious troubles.

Prevention is again the best remedy. People who take reasonable care in regard to sufficient clothing, who always sleep with the windows of their bedrooms open, and who are in the habit of taking a cold bath in the morning are much less liable to cold than are those who liev in hot, stuffy rooms and shun cold water.

Here is the rule for curing a cold which Doctor Lowry gives in the book to which I referred at the beginning:

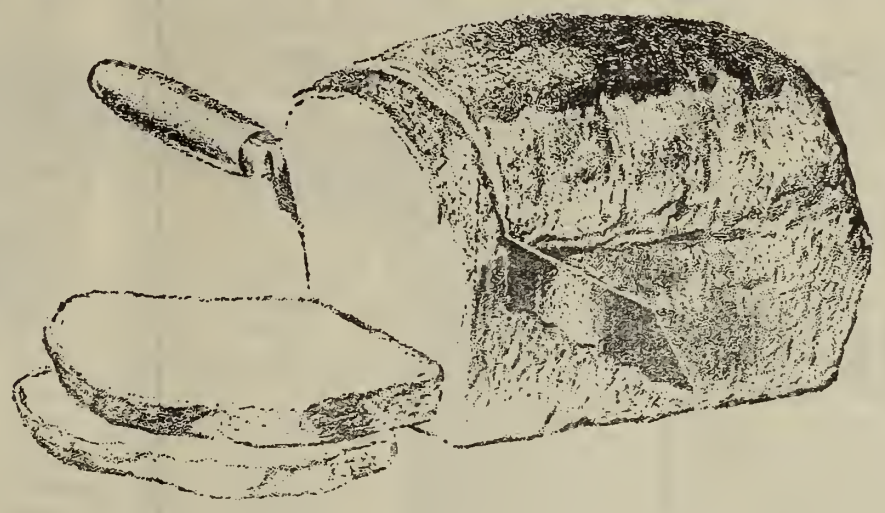
"The cure of a cold can be summed up in one word, eliminate. Eliminate by the skin, by the lungs, by the kidneys, and by the intestines."

He goes on to point out that a laxative should be taken to produce elimination by the intestines; that the drinking of plenty of water will help elimination by the kidneys; that the old fashioned remedies of a mustard foot-bath and hot lemonade will induce sweating and so help the skin to throw off its poisons; and that finally, plenty of fresh air will enable the lungs to do their work. A cold may be checked in its incipient stages by deep draughts of fresh air into the lungs. Doctor Lowry ends with a wise warning against patent remedies for colds. The simple ones which have been mentioned are perfectly safe, and are all that are needed.

Probably most people take far too much medicine. The present tendency among physicians seems to be to discourage the use of drugs and to place emphasis on an understanding of and comformity to the laws of health. Fresh air, sunlight, pure and nourishing food, and plenty of sleep are within the reach of most of us, and in these things lies the correction for many of our ills.—Contributed.

FIVE ROSES FLOUR

for Breads - Cakes - Puddings - Pastries



CARVE thick, satisfying slices for famished children—cut thin, dainty slices for the "five-o'clock"—all from the same fat FIVE ROSES loaf. A nutritious and economical bread-producer, FIVE ROSES makes a luxury out of a necessity.

PRUNE GOODIES

Soak prunes over night in cold water, boil until tender, not allowing them to break, and take out the pits. Grate a squaer of chocolate, mix with the beaten white of two eggs and three tablespoons of powdered sugar. Dip prunes one by one in the mixture, and put them, without allowing them to touch, on a butter tin. Bake ten or fifteen minutes and serve hot.

CREAMY CUSTARD

Three pints of milk, three eggs beaten separately, scald the milk in a pan of hot water, beat egg yolks with a little salt and then add a cupful of sugar, a small teaspoonful of flour mixed with the milk, one teaspoonful of vanilla and the well-beaten whites; stir into the scalded milk and bake thirty minutes with the dish set in a pan of hot water.

TEA COOKIES

Stir one half cupful of butter, seven tablespoonfuls of powdered sugar and yolks of three eggs until creamy. Mix in one cupful of almonds grated and one and one-half cupfuls of finely sifted flour. Sprinkle the baking board with flour, roll out the dough to ⅛ inch thickness, cut with a round cutter, brush with yolk of egg and tablespoonful of milk and bake on floured tins.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

N. S. FRUIT GROWERS IN ANNUAL SESSION

(Continued from page 299)

the place of the 150 varieties they already had. In taking up his subject he said co-operation has been a success wherever tried out. Nova Scotia was the last to adopt co-operative measures and the trials and troubles which they had met with had been many.

In 1907 the got their first co-operative market, in 1911 succeeded in forming the United Fruit Growers Ltd. In 1913 the first lot of fertilizer was brought in, about 100 cars. This was the first attempt in speculative lines, but did much to establish them in the minds of the people. 7,000 tons are now handled besides grass seeds and insecticides at 30% less than they can otherwist purchase it. The cost of spryaing has been reduced on third this last year.

The time has come when co-operation must spread, when a greater activity along these lines is necessary. Something must be done about the transportation question, the Dominion Atlantic Railway had handled the 1919 crop well, olthough there was difficulty in procuring the cars for transportation- but the ocean rate is excessive and all must co-operate to get their just dues. This will eventually work out but the Fruit Growers are now losing by not being able to present their fruit in proper condition. There has not been proper refrigerator service.

Mr. Shaw having to retire, Mr. V. B. Leonard, the newly elected president took the chair.

Discussion on the address

In the absence of Prof. Trueman, Mr. M. K. Ells opened the discussion on the possibilities of the Tractor for orchard work. He had purchased a Cleveland Tractor and had had good success. Initial expense was heavy, about $2,000, including tractor, harrows, ploughs, etc., horse drawn instruments not being satisfactory. He could not see how it would pay the average farmer. He had put in 35 acres in 2 days, which shows it was a great factor in getting your work done at the earliest opportunity, the matter of the crop being put in at the proper time meaning a great profit or a great loss. Summing up, if you have about 30 days fall it is a profitable proposition, if not he would not think it would pay the small farmer.

Mr. A. S. Banks, Waterville, who owned and operated a tractor said that although on the small farm it seemed a heavy expense, still when not in use, it cost nothing to keep. It will do the work of three heavy teams and is a fine reserve power to have on the farm. They used it for loading hay and grain also.

Mr. Sherwood, Port Williams, had two years experience with a Ford Tractor and said it did his work for one-half what he could do it with a horse and quite satisfactorily. The upkeep nothing to date and the outlay in his case $1,050 or $1100.

With a good pulley it had ample power to run anything . He used it for running his ensilage cutter and mowed his hay with it in three quarters of the time he could have done it with a horse. He found it no good for hauling on the road. In plowing and harrowing very good. He thought perhaps caterpillar type better for ploughing and the Fordson type perhaps better for harrowing.

The Ford Tractor, he pointed out, was very flexible and therefore easily abused, and should not be driven at too great speed.

Mr. Ells stated that the Quebec Government, after investigating all makes, purchased 1000 Cleveland Tractors, and are putting them out at cost, $1100 to their farmers.

Prof. Blair said he had two years' experience with a Ford, and found is satisfactory, particularly in harrowing. He thought the tractor a profitable inlar type.

The President then introduced an old friend of the Association, Captain Allen, who, during the war sailing the seas had his ship sunk and was made a prisoner of Germany.

Captain Allen had many experiences to tell, and was thoroughly enjoyed. After three hearty cheers and a tiger, the meeting adjourned to repair to the Strand Theatre, where they were entertained with moving pictures, at the invitation of the town of Kentville.

THE CANADIAN FUR AUCTION SALES COMPANY, Limited, of Montreal, organized and financed by a representative body of Canada's leaders in great commercial enterprises will hold its

First Great Sale of Raw Furs
IN MARCH

Offering immense quantities of fresh, original, unculled Canadian Furs—the Best in the World—UNMIXED with inferior southern varieties, the company will sell to the highest bidder of hundreds of eager buyers from all parts of the United States and Europe.

You get the world's best prices on the WORLD'S BEST FURS, your CANADIAN goods, at our sales.

We do not issue extravagantly-quoting, misleading price lists, but we do see that your furs bring absolutely top prices. Eager inquiries reach us daily from the world's chief buying capitals.

Buyers from London, Paris, New York, Chicago and other great distributing centres have already arranged to attend the MARCH SALE.

The widespread interest shown by buyers clearly indicates the unusual scarcity of raw furs; unmistakably points to an unusually keen demand, particularly for the finer furs—Canadian goods. We think we are not unduly optimistic in predicting

WORLD'S RECORD PRICES
FOR OUR MARCH SALE

LIBERAL CASH ADVANCES will gladly be made on request accompanying any shipment large or small pending sales.

The expense to shippers to the Montreal sales is less—the buying force is as strong—as in any market in the world. Write us. Get our advices—market reports, accurate, reliable guidance to you in buying, and **SHIP NOW**—any quality, of any variety or grade. No market in the world will net you better results.

Last day of receiving for this sale is MARCH 1st.

The Canadian Fur Auction Sales Company
MONTREAL LIMITED

Temporary Offices—Windsor Hotel

Thursday Morning

President in chair.

Mr. Foster read a letter from F. C. Baxter, Ottawa, in reply to one written by him to Mr. Baxter, in behalf of the Fruit Growers' complaining of the model of the standard barrel. Mr. Baxter begged to leave it over until the present meeting of the Association when the subject could be thoroughly discussed.

Report of Resolution Committee followed.

Resolution re better storage facilities moved by Mr. Foster, seconded by F. H. Johnson. After discussion, carried.

Resolution re new loading device moved by Mr. Ells, seconded by Mr. Vroom, and carried.

This was followed by an address by Mr. J. M. Robinson, Kentville, on the thinning of fruit.

Mr .Robinson proved from experi-

ments conducted that thinning always paid, the percentage of No. 1's from the thinned tree being much in advance of that from the unthinned, besides being a better product, and sited experiments carried on in Mr. Johnson's orchard at Bridgetown on the Blenheim and Gravenstein, which resulted in a profit of $35 per acre from thinning, with a decrease of number 3's, 11½ per cent.

An experiment had been carried on in Wagner's last year at the Experimental Farm, 1 acre, 3 rows, 36 trees in each row, thinned every other tree.

No. 1's thinned were 11% over those unthinned, and as the trees were only in the 8th year, results were not as marked as they would be later.

Experiments show that thinning will give you trees that will provide annual crops.

The best time to thin is right after the so-called June crop. Do thinning with a narrow, sharp pointed pair of shears, that can be bought for 45 cents, rather than by hand.

In summing up, Mr. Robinson said, the number of No. 3's put on the market is going to brand the Nova Scotia Fruit, thinning is necessary to get rid of some of these No. 3's.

The fruit is of good flavor, but lacks the finished appearance that the British Columbia and other apples have. Thinning is needed to bring it up to the standard.

A box of No. 1 thinned fruit will bring a better price and grading unthinned fruit costs more.

In conclusion he hoped each member would get a pair of shears and thin all that he thought would not be No. 1's.

Mr. Geo. E. Sanders followed this paper with a carefully prepared address on the Cost of Spraying Materials.

Mr. Sanders, who is an authority on spraying materials, was listened to with great attention.

Hiss address will appear in full in a future issue.

Soem little discussion followed on this subject, after which Mr. G. H. Vroom, Chief Fruit Inspector for Nova Scotia, spoke on the Handling of the Nova Scotia Fruit Crop in 1919.

Mr. Vroom spoke of a trip taken through the Valley in company with Mr. Sanders and Mr. Campbell, Assistant Director Horticulture for New Zealand. Mr. Campbell, he said, thought the rough handling of the fruit a deplorable loss to the fruit grower, and Mr. Vroom said he agreed that it was time something was done.

The Trade Commissioner at Liverpool cabled that 40 to 60% of the Nova Scotia shipment were slack, and in some cases the whole shipment, and the tight barrel of course gets the largest price. Is it not worth while to take more care to have tight barrels. Effort should be made to rectify this condition.

The abuse of the apple grader is often responsible for this; the apple grader has not improved the pack in Nova Scotia. If apples are properly racked and headed, the percentage of slacks will be small.

Double tailing is necessary. It takes time but will pay in the end; it keeps barrel tight and prevents bottom of barrel from bruising.

Mr. J. A. McGee interposed that he thought too great pressure caused most trouble, he had found no trouble with jumble tailing.

Mr. Vroom advised all to drive bilge hoops tight and nail with four short nails before fruit is put in.

He said the matter of the Standard Apple barrel should be looked into, there had been too much variation in the barrels, and he wished to state that undersized fruit packages of any kind would not be tolerated next season. This included strawberry boxes and all fruit packages of any description.

There had been many faults found with the new boxes, and these must be remedied.

Mr. Vroom said No. 3 apples had not cleared expenses last season, so why send them out?

Mr. Frank H. Gillis was then introduced to the audience, and spoke for a short time on Cabot's Quilting, now used so extensively in the United States for lining box cars.

Cabots Quilt is frost proof, and with its use apples could be shipped at any season. He told of the United States Government having investigated it, and its adoption for use in Washington, Oregon and other places.

Cabots Quilt is a heavy padding of eel grass, prepared in a manner to withstand either heat or cold.

He told the method of lining the car, in the States they figure it costs at the rate of 15 cents a box, but is well worth the extra money spent. The apples are loaded when the cars are warm, then sealed and no heater is needed in the car. It is 3 feet wide, comes 250 sq. ft. to a roll, with a cost of about $9.50 per roll.

At the conclusion of Mr. Gillis' remarks, meeting adjourned.

Thursday Afternoon

President in the chair.

Resolution re Daylight Saving moved by Mr. Cox, seconded by Mr. Osborne and carried.

The discussion on the Standard Apple barrel was then opened by Mr. Vroom, who said that at the next meeting of the Legislature it must be seen to that a law was enacted to compel the manufacturer to make a standard barrel.

He presented to the audience a barrel conforming in all particulars to the law now governing the making of the Standard barrel.

These measurement are 64 inches around the bulge; 28½ inches length. The head 17⅛ inches in diameter. The barrel shown was a fifteen stave barrel.

A Review of the Year 1919

—o—

Extracts from an Address delivered by Sir Edmund Walker, President of the Canadian Bank of Commerce, at the recent Annual Meeting of the Bank.

We have pasesd through a year in which the daily surprises have been as perplexing as during the war, and in which the anxieties have been as great, except that sometimes they affected rather the mere happiness of the world than human life itself. War, however, still continues in many countries, and there and elsewhere many have died from lack of food. The war has been won by the most superb co-operation in the attainment of one ideal—the winning of the war. We may lose all that victory seemed to secure by indulgence in countless theories, many of them aiming at the disintegration of society, instead of again co-operating in one ideal—the restoration of order and the improvement of social conditions, so that the happiness of the greatest number may be secured. It is not by standing idle while we discuss methods that we can get out of our present troubles. If the call is to "man the life boat" we do not wait for academic discussion before the boat is launched on its life-saving mission, and too much argument between capital and labour, just now, is madness in view of what we seek to save. The rising curve of prices cannot be made to turn downward without an increase of production, nor can we face the heavy obligations left by the war except by greatly increasing production. The man who does not do his best at his particular job is not merely helping to barricade the only pathway that will lead us out of our troubles, but he is helping to raise or to maintain, the cost of the necessities of life for his own family. I may be called a friend of capital for saying this, but I am on record elsewhere as an advocate of many changes in the present relations of the employee and employer, all of them in favour of the employee.

Insufficient Production

While we and the rest of the world are failing to produce on a sufficient scale to provide for human comfort and to pay our debts, the price of everything has so increased, that although all clearing-house and trade returns show higher figures in money, these generally represent transactions based on smaller quantities of merchandise, and because we think in terms of dollars and not of merchandise, we are living in a fool's paradise. The imperious demands of war rapidly raised all prices, and payment was only possible by inflating the currency; unfortunately inflated currency sustains and further increases prices. If with our own currency we bought only goods made in our own country, the minimum of harm would be done, but possessing more currency and fewer commodities than usual, we are acting like the drunken sailor newely come ashore, and buying everything that fancy suggests, whether necessary or not, without regard to whether it is made in Canada or abroad. For every purchase of goods made abroad, whether in Great Britain or China, or anywhere else, we settle through New York, and the rise or fall of the rate of exchange, about which we are so much concerned, is the expression of our failure, or the reverse, to pay cash or its equivalent. In this connection the speaker has for many years, at these annual meetings, presented the facts of our foreign trade, the peculiarities of our relations with the United States, the sales of our securities abroad to pay for the excess of our imports and the danger of mortgaging the future of our country, and has given frequent warnings as to the character of many of our imports.

Our Exports

The excess of our exports over imports for the year ending 31st March was $343,491,000, as compared with $623,647,000 for the previous year. Although so much smaller than for 1918, the excess was larger than in any previous year. The difference of $280,156,000 is more than accounted for by a falling off of $320,874,000 in our exports to Great Britain, and this again is due to a decrease of $297,893,000 in exports of agricultural products and of $87,318,000 in manufactured articles. For the six months ending in September the exports for the two half years are almost equal, while the imports were $33,571,000 less. It is gratifying to notice that, apart from the decrease in agricultural production, our figures have not been much altered by the cessation of the manufacture of munitions. Food is in greater demand than ever and our factories are behind in the production of almost every line of manufacture, while nearly every form of raw material is difficult to obtain. Our total foreign trade for the fiscal year was $2,176,378,000, as compared with $2,548,691,000 in 1918.

It is clear that, if our foreign trade were on a cash basis, we could pay the interest on our foreign debt and settle for our excess purchases from the United States without difficulty, but Europe cannot pay just now, and we must therefore limit our purchases from the United States wherever that is possible. Doubtless the markets for our securities in the United States will gradually widen, and it will become easier to adjust our accounts, but this will be a poor remedy. We cannot afford to increase our debts to foreign investors in view of the taxation we shall have to bear.

Curtail Imports

Let us consider a few items in our imports which at least suggest great possiblities of curtailment, if we are prepared to restrict our pleasures for the common good. Under the head of apparel we bought abroad to the extent of $8,500,000, including headgear alone for over $5,000,000; under fancy goods, $4,000,000; fruits and nuts, $25,000,000; furs, $4,500,000; gramaphones, over $2,000,000; silk in various forms, $21,000,000; tobacco, nearly $12,000,000; in all, $77,000,000, mostly luxuries. Then we are yearly face to face with enormous imports of material, part of our requirements of which we already produce, or which it would be natural for us to produce. It is obvious that our national finances would benefit if we could either produce the following items ourselves, or avoid in any way their importation; bricks, clays and tiles, over $4,000,000; coal, coke and charcoal, $79,000,000; breadstuffs, $26,000,000; all foodstuffs, $121,000,000—much of this is doubtless absolutely necessary, but surely there is room for a large reduction; iron and steel in all forms, $161,000,000, including machinery $45,000,000; textiles in all forms, $168,000,000; motors, railway cars and other vehicles, $18,000,000. We have repeatedly drawn attention to items of this character in past years but, we fear, without much effect. At present, however, the people of Canada are feeling rather keenly the result of their indifference to their own affairs, and it seems worth while to press these facts once more on their attention.

Imports from U. S.

There is one comforting feature about our trade with the United States. While in 1913 we bought $2.70, last year we bought only about $1.50 of goods for every dollar's worth bought by the United States from Canada. While our purchases have increased in value of 65 per cent, theirs have increased by 180 per cent. Comparing the totals, the imports for 1919 are less by $46,000,000 than in 1918, but as in the item referred to in past years, military stores, there is a decline of $80,000,000 and another decline of $17,000,000 in pork, both due to the cessation of the war, the imports for ordinary purposes are much larger than ever before. The most notable increases are in traction engines, mainly for farming, about $10,000,000, and in raw cotton about $13,000,000.

Reduced Wheat Export

There are many handsome increases in exports to counterbalance increased imports, but the outstanding feature is the enormous decrease of $295,000,000 in the value of exports of grain, of which $270,000,000 is due to a decrease in exports of wheat. There is a reduction in quantity of 150,000,000 bushels, from 215,000,000 bushels of all grains in 1918, to about 65,000,000 bushels in the year ending March, 1919. In the item, "cartridges—gun, rifle and pistol," which has figured so largely in our exports during the war, there is a decline of $139,098,000. There is also a decline of $12,000,000 in exports of flax seed. Against the decline in imports of pork there is a corresponding one in exports of bacon, but there is an increase of about $28,000,000 in exports of meats and butter. There is an increase of $14,000,000 in the item of ships sold to other countries. In our imports the totals of increases and decreases are not very far apart, but in exports we have the extraordinary condition of increases amounting to $110,000,000 and decreases amounting to $443,000,000. Had we been as fortunate in the quantity of merchandise we had to export in the fiscal year ending March, 1919, as we were in the previous year, our financial position would have been very different.

Field Crops

The preliminary estimate of the value of our field crops for the year 1919 is $1,452,787,000, as compared with $1,367,909,000 in 1918, the actual figures for which fell slightly short of the estimate. There was a decline in the value of grain crops, but a large increase in fodder crops and potatoes. Except in swine there is a slight increase in the numbers of all live stock on our farms. It is difficult as yet to obtain accurate figures as to the production of our mines for the year just closed. We estimated that of 1918 at $220,000,000, and the actual figures were $211,301,000. For 1919 the best estimate we can obtain is $167,000,000, showing a falling off of nearly $45,000,000, which is almost entirely in metals. Because of the ending of the war we produced only about half the quantity of nickel produced in 1918; about the same quantity of lead and zinc, at lower pirces; less copper, also at lower prices; and less silver, but at higher prices.

The Process of Adjustment

The difficulties of reconstruction after the great war are even greater than we feared. The whole world is feeling the effect of four years in which the ordinary work and economics of life were not merely neglected, but the basis thereof was almost swept away. We are short of almost every commodity, the strongest evidence of this being the fact that millions of people in Europe face actual starvation. We cannot re-establish the normal supply of commodities except by working harder than usual, and we cannot lessen the terrible strain of high prices without doing the extra work which will put an end to the lack of commodities. We cannot adjust prices without also bringing about a contraction in the volume of paper money and other instruments of credit, and so far as it is possible to enforce contraction without interfering with the production of what is really necessary, the reduction of prices will be facilitated. In a word, bankers should not aid speculation, or assist ventures which do not directly lead to production. We are still building ships with feverish haste throughout the world, and we ought to be spending large sums on railroads in order that commodities may be freely distributed. The present cost of ocean transportation, quite as much as the cost of goods at the primary markets, stands like a huge barrier across the pathway of return to normal conditions. What is worse, however, is that even present prices, in the natural order of things, will go on rising until the lack in the world's supply of commodities has been filled, and there has been a large contraction in the volume of paper money now in existence.

Wages and Prices

In the case of many classes of wage earners there has been an adjustment of pay against this increased cost of living, but there are many instances in which there has been either no adjustment or one quite inadequate. There are, however, some classes of earners who are so highly paid, in comparison with the past, that they have unusual spending power, and, along with all the others who have profited unduly by the war, they are spending their money in such a manner as to increase still further the troubles of the less well-off. Apart from this, after the gigantic struggle of the war, the world has slackened its energies and is filled with argument and unrest. All these elements move along an ascending spiral which clearly ends in ruin if we cannot arrest their course.

Prices will be higher than before the war for many years to come, but a readjustment to tolerable conditions is absolutely necessary if we are to enjoy the peace bought at such a cost. Governments must cease borrowing and keep their expenditures within their powers of taxation; both individuals and governments must spend less on things not absolutely necessary, and we must all work harder to produce the normal supply of all the commodities useful in life.

Co-operation Essential

Canada, as I have already said, won its high place in the world's regard by superb co-operation in the one ideal of winning the war. Can we not compromise for the moment the differences between capital and labour, between farmer and manufacturer, between the various interests that are risking our future for the sake of their own particular grievances, and co-operate in another ideal equally great, the restoration of peace and the return of prosperity on a better foundation? With this accomplished the separate ideals of the industrial divisions of our society can be discussed with far more chance of fair adjustment than is possible in these difficult times.

Must Increase Exports

We know now roughly the cost of the war as represented by our public debt. This debt is held mostly at home but partly abroad. In addition, there were issues of securities made before and during the war by governments, municipalities and private companies and sold abroad. On the whole of this debt, so held abroad, the annual charge

is about $190,000,000 per annum. Of this roughly about $65,000,000 is due to holders of our securities in the United States, and about $125,000,000 to holders in Great Britain and Europe. This debt we can pay only by an excess of exports over imports or by new borrowings. The debt at home is our own domestic affair. Certain citizens have advanced the cost of the war to the nation, and we now have to distribute this cost by taxation over all the citizens of Canada (except those who escape taxation), so as to meet the annual amortization payments. If the annual payments are obtained by reasonably fair taxation, so levied that the taxes do not become a cause of restraining our industries, we shall not fail to win through, but to accomplish this, much study of the subject is necessary.

Taxation

Many forms of taxation not yet in use in Canada will doubtless be employed, in addition to those now in force, but the whole question should be approached without that class feeling which often causes taxes to be so apportioned, that bitterness and a sense of injustice are felt by many who do not object to being heavily taxed so long as those who really can afford to pay their share do not escape. The income tax should be paid by a much larger number of citizens. The tax on surplus profits needs much study; there is all the difference in the world, both in justice and in the interest of the community, between a large aggregate of profit made by a small margin on each transaction and a similar sum made by an unfairly large margin of profit on each transaction. The community may be deeply interested for its own advantage in securing the extension of the first kind of transaction, while no one is interested in the success of the other class except the taxpayer himself. The tax in the end must be borne by our industrial activities, and we are foolish if, in our eagerness to escape our own share, we make such burdens so heavy on others that many of these activities must cease, and commodities that under fair conditions might be produced at home are replaced by imports from abroad.—Advt.

BORAX WITH POTASH INJURES CROPS

Many complaints regarding injury to crops apparently resulting from the use of potash from Searles Lake, Cal., recently have been received by the U. S. Department of Agriculture. The natural brine of this lake from which the potash salts are prepared contains a considerable amount of borax. Apparently one, at least, of the companies operating in the locality did not exercise sufficient care in the preparation of the potash and let out a considerable amount of potash salts in 1918 with a high percentage of borax, averaging probably 10 per cent. and in some samples going as high as 23 per cent. The department has been conducting investigations of the matter in the field whicr indicates the substantial corectness of many, at least, of the complaints. In some of the special fertilizer tests of the department where Searles Lake potash was used, injury, which apparntly was the direct result of the high percentage of borax, was clearly shown, while potash form some other sources showed beneficial effects upon the crops tested.

THRESHING RED CLOVER SEED

In order to secure the heaviest possible yield of seed of red clover it is imperative that the hay containing the seed be threshed in dry weather. If threshing is done when the hay is somewhat moist, a quantity of the seed will not thresh out readily and, consequently, the yield will be reduced. It is therefore a good policy to defer threshing operations until suitable weather prevails.

Threshing may be done with an ordinary threshing machine, although the operation is somewhat slow. In order to get all the seed out, it will be necessary to run the material through at least twice. When the clover is run through the first time, the machine may be operated as for threshing grain. Heads and chaff will then be separated from the stalks without the latter being broken up too badly. In order, however, to get the clean seed separated out, the heads and chaff have to be run through a second time after certain slight adjustments to the machine have been made. A plate of sheet iron or a piece of hardwood should be fastened directly behind the cylinder, closing all the back except about nine inches on the left end of the cylinder and all of the right end of the front part of the cylinder except one foot. If a small machine, with the concaves on top of the cylinder, is used, the concaves may be left open. If a large machine, having the concaves at the bottom, is used, it will be necessary to close the small holes in the concaves, the object being to make all the material pass directly from one end of the cylinder to the other so that the seed, in passing through, may be hulled perfectly.

The best machine for threshing red clover seed is, however, the clover huller. The clover huller separates the seed from the rhaff in one single operation and is therefore to be recommended whenever red clover seed growing is undertaken as a regular business on a sufficiently large scale, either by individual farmers or by districts as a whole. It is safe to say that in a district where two hundred acres or more are devoted to red clover seed growing yearly, it would pay teh growers to buy a clover huller jointly. **The extra amount of seed obtained by the nse of the clover huller would pay for the machine in very few years.** Besides, the labour necessary for threshing the seed would be reduced to about one half of that required when an ordinary grain threshing machine is used.

NO longer is there any question about farm engine value. Long ago engine power made a secure place for itself on the good farmer's farm. Made itself the indispensable worker at a dozen or a score of small jobs we need not name here. You know them too well. They are a part of the routine of your life.

Nor need there be any question as to *which* engine power will serve you best for the longest time.

Tens of thousands of power users will tell you if they have the opportunity that the best answer is **"International Kerosene Engine!"** On the day you read these lines many new Internationals will start work for new owners. These engine investments are made on the strength of rugged Harvester reputation, kerosene economy, quality of materials and construction. And you will have the sureness of International service at your service.

The figures at the top are the sizes in which International engines are made. One or another of them will serve you. See the International agent. Write the nearest branch for a folder.

SYDNEY BASIC SLAG

We are glad to inform the Farmers of New Brunswick that after being shut down for two months for want of raw material, our mills are again running day and night, and that full supplies of Basic Slag will be available for next season. In order to make for still greater efficacy we have increased the fineness of our product from 80% to 85%. This is the highest standard the world has ever known. We want reliable agents in districts where we are not already represented and all applications should be addressed to our

N. S. FRUIT GROWERS IN ANNUAL CONVENTION

(Continued from page 315)

Mr. Alcorn said he claimed the 15 stave barrel with a 9/16 joint as near perfect as possible. He was convinced that people were most careless in packing their apples.

Mr. McGee thought the trouble was with the man who made the barrel. The coopers were out to make money, and in making them at the rate they did could not possibly keep to the proper measurements.

T. H. Morse, Berwick, said the staves were too thin this year, and asked what thickness they should be, and was told 7/16 of an inch.

Mr. Pineo said the man who made the barrels should put his name on the barrels and then stand behind it.

Mr. McMahon favored Legislation to compel manufacturer to conform to the law and the stamped barrel the only way. If they did not have a standard barrel in Nova Scotia they were up against a serious loss. Ottawa must be compelled to see that the standard barrel is possible.

Mr. Andrew Wescott spoke on loss which the new barrel has caused, about 15 lbs. on the barrel.

Mr. Andrew MacDonald spoke of the loss in potatoes due to the variations in the barrel this past year. 165 lbs. potatoes the required weight.

Mr. Vroom had been looking into this matter, preparing for conference at Ottawa, and found the barrels hold, he could safely say, from 175 to 178 lbs. of potatoes.

Mr. Ross Chipman thought it would be well to put the barrel back to the old standard.

Mr. Gates, one of the largest manufacturers of barrels in Nova Scotia, thought it was up to the farmers not the coopers.

Questioned, he said he considered the standard barrel a very good shape.

After considerable more discussion of the question, a resolution re the Standard barrel was moved by A. S. McDonald, seconded by Geo. Pineo, and was carried.

This being the last on the program of the Convention, the meeting adjourned, after a very interesting and instructive session.

Resolutions passed during the session follows:

Whereas, we the Nova Scotia Fruit Growers' Association, appreciate the necessity of cold storage facilities at Halifax to aid in the better marketing and handling of farm products.

Therefore resolved, that we ask the Federal Government to take such necessary steps as will provide such cold storage facilities as will meet the needs of the Province.

Whereas, it has been brought to the notice of the Nova Scotia Fruit Growers' Association that an improved loading device has been invented to facilitate the better handling of barrels of apples on ship board.

Therefore resolved, that we ask the Federal Department of Agriculture to investigate the practical working of the same.

Resolved, that the Nova Scotia Fruit Growers' Association in Annual Session at Kentville, this 22nd day of January, 1920, again place itself on record as being absolutely opposed to any so-called Daylight Saving Bill being enacted by either the Nova Scotia Governemnt at Halifax or the Federal Government at Ottawa.

Further resolved, that we protest strongly against the Government Railways and other Railways of Canada advancing the clocks one hour, in order to force such a scheme on an unwilling majority as was done in 1919, after Parliament at Ottawa had defeated such a bill.

And further resolved, the Railways of Canada arrange their time table accordingly, to meet the situation rather than by advancing the clocks one hour, which retards economic and business relations throughout Canada, as was the case last year.

And further resolved, that a copy of this Resolution be mailed to the Acting Prime Minister of Canada, the Premier of Nova Scotia and every Federal and Provincial member of Parliament of Nova Scotia.

Whereas, it is the opinion of the Nova Scotia Fruit Growers' Association that the difference in size and shape of apple barrel is due to variation in the milling of stock and careless cooperage methods, and

Whereas these defaults can be largely overcome by having more definite instructions as to dimensions of stock and more explicit cooperage specifications,

Therefor, resolved that in the opinion of this Association, the specifications of stave from the mill should be 29½ inches in length for the soft wood barrels, that said staves be uniformly one-half inch thick, and that in the cooperage of the barrel the bulge hoops shall be at least eight inches below the end of the staves. Also that the head shall be smooth at least ⅝ inch in thickness and that the joint be 9/16 inch, making a barrel to contain 15 staves and that the staves be sufficiently strong in the lock to hold firmly and rigidly.

Further resolved, that legislation be enacted to make these specifications effective, and that suitable inspection be provided to enforce the same, and that suitable penalty be accorded infringements of these specifications by millers and coopers.

"Good cotton seed meal is running toward the high water mark, flax seed has reached the highest price on record in this country and meal is still sailing up. Alfalfa meal is not going to be plenty. There are no more brewers and distillers grains. It will be a year for the scientfic feeder who uses no "rule of thumb" methods but trusts his feed dealer to provide him with a balanced ration which will give him the results he is seeking at the lowest possible cost for protein. **Only the competent feed manufacturers and dealers will be able to do this."**

Therefore

NOVA SCOTIA DAIRYMEN IN ANNUAL SESSION

(Continued from page 295)

ent sections of the province so that the work of the Association may become better known to as wide a circle of the milk producers as possible.

Mr. McKay outlined the aims and objects of the National Dairy Council and the Association pledged its financial support. It was also decided that an effort be made to have every creamery patron a member of the Nova Scotia Dairymen's Association. Mr. McKay said he hoped to see the Association assume province wide proportion so that every phase of the dairy farmers as well as the cheese and butter makers problems would be championed by one strong organization.

Expressions of regret were voiced re the proposed severance of Mr. Harvey Mitchell's connection with the Dominion Dairy Division. Mr. Mitchell has given the best years of his life to the promotionof the Dairy industry in the Maritime Provinces and in leaving the work for some one else to follow up he leaves with a feeling of good fellowship existing between him and the dairymen, who would all be pleased to have him reconsider his resignation and remain with them to guide them in their work as he has so efficiently done in the past.

(Continued next issue)

YOUR AUTO TIRES FOR 1920

The Maritime Farmer will supply auto tires for its readers in 1920 as usual. We have a large supply of 30x2½ ordered and this will forestall any advance in the market. They are all first tires and are guaranteed for 3,500 miles. We sold scores of them last season and did NOT HAVE A SINGLE CLAIM TO ADJUST. That is a pretty good record and speaks volumes for the wearing quality of these tires. WE ALSO HAVE ARRANGED FOR A FULLL LINE OF HIGHER GRADE TIRES IN ALL SIZES. BEFORE YOU ORDER WRITE US FOR PRICES. WE WILL SAVE YOU A LOT OF MONEY, IF YOU ARE A MARITIME FARMER READER AND OWN AN AUTO. IF YOU ARE BUYING A NEW CAR WE CAN SAVE YOU MONEY ON YOUR EXTRA TIRE. WATCH THIS FEATURE OF YOUR BUY.

We can also supply inner tubes in all sizes.

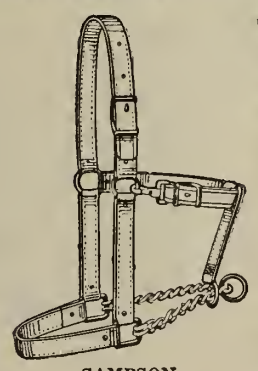
BUTTER MOISTURE 16%

In an article by Hon. W. M. Lea, published in our last issue, reference was made to the legal excess moisture in butter. It read 10%; it should have been 16%. Of course the error would be quite apparent to anybody connected with the manufacture of butter.

Your Horse Can't Break This Halter

We assume the full responsibility by attaching our guarantee tag to this Griffith Sampson Halter. This means that if it breaks within a year from date of purchase we will repair it, or send you a new halter absolutely free of charge.

There's strength in every strap and stitch of the Sampson. See that chain chin draw? That's electric welded steel chain—it grips the horse under the jaw when he pulls and he soon yields to its strength.



SAMPSON

Griffith Guaranteed Halters

Our guarantee tag is attached to all our guaranteed halters. Isn't that a worth while consideration when buying your next halter? Price of Sampson $2.50 (in the West $2.75). If your dealer can't supply you send direct to us giving dealer's name.

Send for free booklet. Shows a halter for every purpose—at a price to suit your purse.

G. L. Griffith & Son 64 Waterloo St., Stratford, Ont. 53

MILL FEEDS ARE SCARCE

Heavy Shipments of Wheat Have Curtailed Supply. Only from 200 to 300 Bags to Car. Other Feeds Available

Owing to the heavy shipment of wheat from Canada, mill feeds are scarce. At present the mills are only offering from 200 to 300 bags to the car. The balance is offered in other feeds, flour, oats, etc. There is available, however, balanced feeds of good feeding value. These have advanced in price during the past couple of months and the outlook is for even higher prices. Oats are high and were quoted last week at $1.17 bulk for No. 2 Choice Western. They are scarce and the price has been stiffening. The Maritime Farmer has supplied many carloads of feeds and flour to agricultural organizations this winter and has saved them thousands of dollars. THE MARITIME FARMER CAN SUPPLY MIXED CARS OF MILL FEEDS AND FLOUR, straight cars of oats or STRAIGHT CARS OF WILL BE SUPPLIED AT COST TO BALANCED FEEDS (MIXED WITH OATS IF DESIRED.) These FEEDS MARITIME FARMER READERS IN STRAIGHT CARS. YOU CAN SAVE A LOT OF MONEY BY CO-OPERATING WITH YOUR NEIGHBORS. YOU DO NOT WANT CAPITAL TO DO THIS. YOUR BANK MANAGER WILL HELP YOU FINANCE. We shall be glad to quote you prices on application.

We have some No. 1 Timothy seed to offer at less than the cost today. There is only about 10,000 pounds left and it goes to the first applicants.

WINTER PRUNING

(Experimental aFrms Note)

Winter pruning of bearing orchards should be attended to every year. The orchardist should go over his trees systematically and cut out crossing or broken limbs wherever these occur. Cut close to the main limb, don't leave stubs, and paint the wound with white lead and boiled oil (no turpentin). We jrefer a stiff stencil brush and rub the paint well into the wood. A little brown coloring makes the wound less conspicuous. When cutting a large limb cut on the under side first, this prevents tearing the wood and bark as the limb comes away from the tree. When limbs spread too wide and make cultivation near the tree impossible, but to a shoot that is growing up. This shoot will soon grow strong and take the place of the part cut off. Many of our older orchards have acquired the off year habit, which means crop one year, grow the next. It is after the growing year that we must thin our trees and see that there is not too much new growth to exclude light and air. If there is a heavy new growth thin this to distribute it as evenly as possible. Don't leave stubs of heavy new growth hoping they will form fruit spurs, as cutting away the heavy new growth cuts away the big plump buds which easily form fruit spurs, leaving the les mature buds which prefer to make new wood growth, so the result would be crowding instead of thinning the tree.

Use sharp pruners and saws and make clean cuts.

Use sharp eyes and good judgment, distribute the new growth evenly and the crop will be evenly distributed.

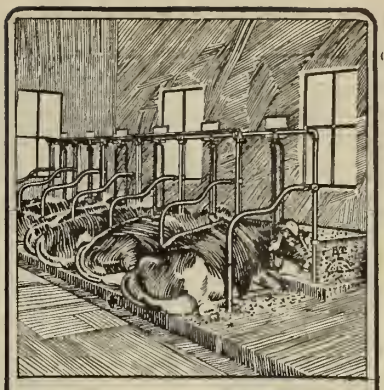
A little well done every year eliminates the profits.

Don't haggle a tree and expect the wounds to heal.

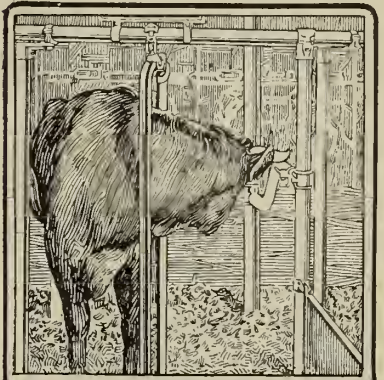
Don't prune trees when frozen hard.

Don't leave pruning till too late.

Don't leave prunings lying about; burn them and take advantage of the ashes.—R. H. Helmer, Superintendent Sumerland, B. C.

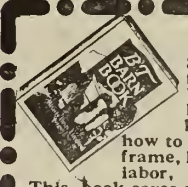


1. Comfortable cows give the most milk. BT Steel Stalls keep the cows comfortable. The BT Stanchion ties the cow in the centre of the Stall. There is nothing to chafe her neck and she does not have the weight of the chain on her neck all the time.



2. The BT Stanchion swivels right around to either right or left so that the cow can turn her head in perfect comfort. She can card herself, get up, lie down and reach her feed and water easily and comfortably. This extra comfort for the cow means extra profit for you.

3. Your cows must have proper freedom of movement if they are to do their best. They cannot do their best when they are tied in stationary wood stanchions. Stationary Stanchions restrict the movements of the cows, and pin them in a cramped position. The coupon brings full particulars.



Send this coupon for the 352-page Barn Book. Tells how to plan and build the barn, how to ventilate, how to frame, how to save steps, labor, time and feed. This book saves you hundreds of dollars in building. It is free.

Make Money This Winter—Saw Wood

There is big money this winter sawing wood. Coal is high. Wood will be scarce. Now is the time to clean up. The GILSON HEAVI-DUTI SAWING OUTFIT is the machine to do it with. Makes its own spark without the aid of batteries. You cannot afford to buy any engine until you know all about the Gilson Heavy-Duti. When you know about it, you will not buy any other. Catalog and information free if you act quickly. Write to-day.

THE NEWFOUNDLAND POULTRY SHOW

(Continued from page 306)

have been, consequently I will not express any detail account of them.

I am strongly of the opinion, my good friend, that "Geese and Ducks" should be handled and examined in the same manner as the hens, etc. By so doing it will insist upon exhibitors sending better water fowl and the only "true bill" in which a judge can save himself from the opinion of others.

GROOMING CATTLE GOOD BUSINESS

(Continued from page 300)

all the loose particles of dust and leave a shine on the hair that cannot be obtained by any other means.

Then, again, this work should not be confined to the milch cows entirely, as the heifers and calves are benefited just as much as the older animals. It keeps them free from vermin, and animals that as a general rule are wild and nervous, soon become quite tame and easily handled, and in our case, at least, they seem to do better than the heifers that were raised before we started regular grooming and clipping.—E. A., O. V. J.

RAW FURS AUCTION IN MONTREAL

Fur interests are much interested in the announcement from Montreal that the Canadian Fur Auction Sales Company Ltd., has been successfully organized and powerful interests are subscribing for its $5,000,000 capital.

The purpose of the Company is to hold three or four great Auction Sales of Raw furs every years so as to provide in Canada an outlet for Canadian furs and obviate their being sent to foreign markets where their identity is often lost, and inferior southern furs are graded with them.

The promoters believe that Canadian Furs will benefit greatly from the creation of this important exclusive outlet and that excellent prices will be obtained—considerably better results being apt to accrue to the shippers of the pelts.

Splendid premises have already been acquired and are being fitted with cold storage and every facility for handling pelts, and we are advised that the promoters are already able to assure the success of the first sale which is announced for March.

Lord Shaughnessy, Lorne C. Webster, Sir Herbert Holt, W. A. Black, J. W. McConnell, A. Pierce, R. S. Coltart, E. E. Cummings, and A. J. Brown are among notable financiers and fur merchants who are interested in the Canadian Fur Auction Sales Company.

MARE HAS THRUSH IN FRONT FEET

I have a mare that is bad with thrush in front feet; what is the cause and how should I treat it? W. J. S.

Ans.: Thrush is generally caused by standing in water and filth, such as wet straw and stable refuse. It may also be due to frost bite or to dirt from the field being allowed to cake and remain for a long period in the cleft of the hoof. Every horse's hoof should be cleaned out once a day, around the frog, when working on the field. Neglect of this duty is the cause of many feet troubles among horses.

Place your animal in a clean stable, with a dry floor, well littered. The seat of the disease should be cleaned, the excessive growth removed, and calomel applied as follows: Calomel half an ounce; sweet oil two ounces. Mix together and spread on a piece of lint or oakum, and insert in the cleft of the frog and over any other diseased part.

Imperial Ex-Service Men Will Train on Canadian Farms

Soldier Settlement Board (Canada) Desires Names of Successful Farmers Who are in a Position to Give These Men the Experience They Need

THE benefits of the Soldier Settlement Act have been extended to Imperial Ex-service men. Many of these veterans of the Great War are desirous of coming to Canada this year and regulations under which they will be granted financial assistance have been adopted by the Soldier Settlement Board.

SELECTION OF CANDIDATES IN BRITISH ISLES

ONLY those especially equipped to undertake the duties of farmers in a New Land will receive permits entitling them to come to Canada and begin training under Soldier Settlement Board supervision. These are the general qualifications:

1. Physical fitness;
2. The possession of at least $1000. on landing in Canada;
3. General fitness (which includes reputation for honesty, industry, intelligence, etc.)

All applicants will appear before Canadian Emigration agents who will reject those who are obviously unfit. The remainder will appear before a Selection Committee composed of practical Canadian Farmers, who understand all the conditions which make for successful farming in the Dominion.

WITH FARMER TILL QUALIFIED

SELECTED candidates will be required to remain with a farmer till qualified. A large majority of these men will require two years' experience.

FARMERS OF CANADA HAVE RARE OPPORTUNITY

PLACES are desired for these men. Farm help is essential for the full development of Canada's agricultural resources. Farmers who need assistance next Spring have the opportunity of applying for these selected men. Every man whom the Soldier Settlement Board places this year will be of proved worth. Some will have advantage of experience on farms in the British Isles. Those who are without agricultural experience will be eager to acquire the knowledge necessary to equip them as soldier settlers under the Act.

This is an opportunity that farmers should not fail to embrace. As the need of agricultural help is shown, the Soldier Settlement Board will arrange for the coming of the men. Only those who are assured of positions on farms will be permitted to come to Canada.

If you can use an Imperial ex-service man on your farm write to the nearest District Office of the Board. The offices are located at: Victoria and Vancouver, B. C.; Edmonton and Calgary, Alta.; Regina, Saskatoon and Prince Albert, Sask.; Winnipeg, Man.; Toronto, London, Fort William and Ottawa, Ont.; Quebec and Sherbrooke, Que.; St. John, N. B.; Halifax, N. S.; Charlottetown, P. E. I.

Union Bank Building, Ottawa, Ont.

WINTER CARE AND REPAIR OF FARM MACHINERY

(Experimental Farms Note.)

"Let him use more machinery then," is the stock phrase and cure all prescribed by the "know-it-all" of the afrmer's labor problem. This is just what he has been doing for a generation or ever since city wages were distinctly higher than those upon the farm. Today machinery has doubled in cost because it does not grow upon the land by the free agency of sunlight like crops but is made in cities and by labor that exacts far more than the farmer's wage. Thus there is a limit to the machinery the farmer can afford to buy and to the extent to which he can substitute machinery for expensive labor. In other words machinery is now expensive labor.

Farmers, therefore, are going to house their machinery in some way since the price is still soaring and since the life of an implement well cared for is prolonged four or five times the life of machinery which is left in the open. An energetic farmer will not allow his horse or cow to stand out in the rain or snow. He will rush to get his crop into the ground on time and in the best possible condition and he will gather his harvest promptly and carefully so that there is the least possible loss. Many of us will do all these things and still allow a part of the toil earned revenue to be swallowed up in the purchase of sky soaring priced machinery or in expensive repairs.

See to it that each implement wears out and does not rust out. Every one knows that it should be housed but housing under any condition and not properly caring for it otherwise, constitute very poor care. Machinery may be just as well cared for if it is allowed to stand in the shade of a tree as if stored in some of the leaky sheds, open sheds, poorly drained sheds or combined implement sheds and hen roosts which are found.

Do not merely go through the motion but shelter considerately and before doing so, First list the repairs needed for next season and secure them along with an assortment of bolts, rivets, springs, etc., in time to have each implement repaired and ready mor use on time. An implement in repair at all times will have a longer life and will give more satisfactory service during its life than one receiving irergular attention. Secondly clean and oil each machine and give all polished surfaces an application of some anti-rust preparation. Axle grease or other lubricant will answer the purpose.

Another "critter" occupies space in the implement shed, the twenty-four-hour-day-iron horse or tractor has arrived on the farm. To insure more efficient use of this implement next season there are two things that should be given special attention. First, take steps to put it in the best possible condition now, and secondly learn as much as possible about the fundamentals of tractor operation. Read carefully the instruction book; newspapers, books and magaizne articles also furnish a wealth of information. If possible attend one of the tractor schools which will be conducted during the winter. Leave nothing undone that will fit you to become a more proficient tractor operator.

A properly fitted work shop is a necessity on most farms. It provides a means of acquiring the "knack" in doing repair work. Again at critical times, such as harvesting or seeding seasons, one long trip to town for repairs may cause a loss more than equal to the value of a well equipped shop.

Paint, although last mention, is by no means the least important factor in prolonging the usefulness of an implement. Painted machinery on the farm is an exception rather than a general rule. The chief utility of paint is in protecting materials rather than improving appearances. Paint of good quality only should be used and the surface to be painted should be dry and clean before the paint is applied.—W. L. Graham, Asst. Dominion Field Husbandman.

LOUDEN

Let Louden Architects Plan Your Barn

OUR 112-page Barn Plan Book is worth money to every farmer who is going to build a new barn or remodel his old one. Seventy-four of the most modern barns on this continent are illustrated, including floor plans.

This book is not our catalog. The Louden Barn Plan Book was prepared by architects who specialize on barns and other farm buildings, and who have gathered ideas from farmers in different sections of the country. Naturally, in such a book, you will find many ideas new and valuable to you.

COVERS EVERYTHING

This book discusses the values of different kinds of building materials and the advantages of various methods of construction. It deals with ventilation, drainage, lighting, and contains a valuable chapter on mixing and laying of concrete.

This book is worth money to any farmer going to build or remodel.

MAILED FREE

We are not asking you to pay a cent for Louden's Barn Plan Book. Simply fill in the coupon, clip it out and mail to us. We will send you the book by first mail.

Send us a rough sketch of your old barn, showing location of windows, doors, etc., and state number of horses and cows you want to house, and our Architectural Department will show you how to remodel it at least expense and at the same time have a complete modern barn. Show on your sketch the location of your houses, the roadway, the well, and indicate the south side of the barn.

We will supply you free floor plan suggestions.

LABOR, THE BIG ITEM

If you are going to build or remodel, this book will show you how to save labor. And Louden Barn Equipment will also save you many a step, many a lift and many an hour.

You will be proud of your barn, fitted with Louden's modern equipment, and your chores will be cut in half.

In a Louden-planned and Louden-equipped barn, cows produce, on a conservative estimate, two quarts more milk per cow per day. Healthful, contented cows in clean, sanitary quarters, always produce more milk and actually consume less food.

Louden Barn Equipment will make money and save money for you. The Louden Machinery Co. has been established in Canada for twenty years and knows Canadian conditions thoroughly. Louden Barn Equipment is designed and built to meet these conditions.

Fill in the coupon and get this valuable 112-page Barn Plan Book.

BULL'S CREEK FARM

R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a heifer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

Holstein Herd Averages 18812 lbs. Milk

A herd of 13 purebred Holsteins last year averaged 18812 lbs. milk and 638.57 lbs. fat.

Do you realize the money there is in such cows? It is estimated that the average annual yield of all cows in this country is under 4,000 lbs. These 13 cows produce as much milk as 62 cows of the 4,000-lb. class.

Why feed, milk and shelter any more cows than you need to produce the milk you require? If interested in

"YOU SEE IT'S A MARITIME FENCE-"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

Healthy Stock will Make Money

IF you want to make money out of your stock you must keep them in good condition. This largely depends on the nourishment they get from their food.

Every farmer understands the difficulty of keeping his stock healthy through the winter. Shut up in stables and pens they are likely to get off their feed, become scraggy and hidebound and thrive badly. Keep your stock well and thriving through the winter with—

International Stock Food Tonic

It gives animals strength and endurance, improves their appearance, purifies the blood, and helps keep them in the highest state of productiveness.

The Cost is Small - 3 Feeds for 1 cent

HORSES have their systems toned up by International Stock Food Tonic, which makes up for lack of exercise and green food, and brings them through the winter in top-notch condition for the Spring work. It is the best thing to give for liver trouble, influenza, coughs, hide-bound, or blood trouble. A tablespoonful with the regular grain feed makes sound, firm flesh, clean blood and a glossy coat.

COWS fed International Stock Food Tonic increase in weight and vigor. One tablespoonful of the tonic added to the food of the cow will materially increase the supply of milk. The blood is purified and digestion promoted. If you want more milk and healthier cows this winter, and better calves next spring, use International Stock Food Tonic regularly.

HOGS given International Stock Food Tonic can assimilate an enormous amount of food, and thus attain rapid growth. The average fattening hog when fed this tonic will make an extra gain of one half pound or more every day, over the usual plan of hog fattening. It furnishes a tonic that stimulates the appetite, regulates the bowels, prevents scours, quickly eradicates worms and prevents further development, and is relished by the animals.

The cost of International Stock Food Tonic is small—the results are enormous. Don't wait until your stock is out of condition. Begin the tonic now and keep them healthy.

For sale by dealers everywhere in convenient sized packages and in 25-lb. pails at $3.75 each.

FREE ON REQUEST: write us stating the number of stock you own, and we will send you, free of charge, a copy of our 1920 almanac which also contains a series of Breeders' Tables, arranged in simple form, which enables you to keep accurate track of all your breeding stock.

Cletrac TANK-TYPE TRACTOR

Not the Cletrac Way | The Cletrac Way

Be Ready With A Cletrac

BUY your Cletrac now. Break it in on early Spring jobs and be ready for the Spring rush.

When the ground is "just right," the Cletrac farmer is ready—knows his Cletrac—has the odd jobs done. Weather conditions or a short season make no difference, the Cletrac keeps going hour after hour—**more hours—longer days.** Does the work of six horses with power to spare.

The Cletrac's weight is evenly distributed over its wide track. The Cletrac turns short, swings back to the furrow quickly. No power or time lost at the turn. It burns coal oil (kerosene), perfectly. It lays its own track over plowed ground—goes anywhere, does everything. Light weight, adaptability and low operating cost fits the Cletrac for any work.

There's a book you'll want, "Selecting Your Tractor." Send for the book or see your dealer.

If You Want Greater Comfort, Efficiency, and Economy,
Install a Fairbanks-Morse "F" Power and Light Plant

PRESS a button and, Presto! the "F" Power and Light Plant instantly floods any room in your house, your cellar, your stable, drive-shed, garage, out-buildings, barn-yard, or drive-way with a flood of brilliant electric light. The disagreeable task of filling and cleaning oil lamps, dirty lanterns, and lamp chimneys is ended when your "F" Power and Light Plant is installed.

Electricity is a practical and efficient labor-saver on the farm. But the "F" Power and Light Plant does more than light the home. It will run your washing-machine and turn out your heaviest washing in less time than is possible by the back-breaking method.

The "F" Power and Light Plant also provides current for an electric iron—saving time and fuel and the discomfort of a sweltering kitchen. It will run an electric vacuum cleaner, which does away with the labor of sweeping and eliminates the dust raised by a broom.

The current it produces can also be used for an electric toaster, a coffee percolator, and the dozen-and-one modern electrical conveniences which are used in the city home.

The "Z" engine can be belted direct to your cream separator, churn, pump, etc., thereby reducing the drudgery of many irksome jobs.

You will want to know all the advantages and uses of this plant. Fill in the coupon in the right corner and send to our branch nearest you. We will gladly send you full particulars and tell you where you can see the "F" Power and Light Plant in operation.

NEW BRUNSWICK DEPARTMENT OF AGRICULTURE SHORT COURSES

It has been felt that many farmers' sons would welcome an opportunity of attending a Short Course in Agriculture, provided such facilities were placed within easy reach. Many young men on the farm find it difficult to get away from home for any length of time, but would be able to attend classes in Agriculture if held in their own communities. It was to provide such facilities that Short Courses of two weeks' duration have been arranged to be held at Moncton and Chatham. These courses begin on February 16th and continue until February 28th, the dates being the same at each place. At the time of writing, February 7th, already a goodly number of students are enrolled. Others may enroll at any time during the course. Lectures and demonstrations will be given on the following subjects:

Livestock, Dairying, Feeds and Feeding, Poultry, Beekeeping, Fruits and Vegetables, Soils and Farm Drainage, Co-operative Marketing, Seed Improvement, Farm Management, Practical work will also be given in the judging of all classes of farm livestock and inspection and judging of samples of grain, grass and clover seed. These subjects will be discussed in a practical way. Special lectures will be given during the course by the following men:

L. T. Floyd—Beekeeping.

C. C. Hicks—Seed and Crop Improvement.

A. C. McCulloch—Poultry.

A. G. Turney—Fruits and Vegetables.

H. W. Coleman—Milk Testing and Co-operative Dairying.

F. W. Walsh—Livestock.

H. J. Pugsley, V. S.—Diseases of Farm Stock.

All farmers in the district are invited to attend and take advantage of these special lectures.

Each class will select a Stock Judging Team of three memers, who will compete with a similar team selected by the other class. Suitable prizes will be offered to the winners of this contest.

While these classes are designed primarily for the younger men, a hearty welcome is being extended to anyone interested in Agriculture and a special invitation is also being given to Returned Soldiers interested in farming to attend.

The New Brunswick Department of Agriculture in co-operating with the Federal Department of Agriculture (Livestock Branch) is offering assistance, which, if taken advantage of, will help to solve the scrub bull question as the assitance is especially directed towards districts in which scrubs are kept.

Briefly, a pure bred bull is offered free of cost for the use of farmers in thinly settled districts, in new districts and in districts where the advancement in stock improvement has been slow, due to farmers being unfamiliar with the benefit derived from the use of a good pure bred sire. To secure a bull under this policy it is necessary to form an asociation of at least ten farmers who must be unanimous in regard to the breed of bull desired. It is not the intention to place bulls in a district where privately owned pure bred sires are standing for service and interference with private enterprise is thus avoided.

Some member of the Association must be prepared to take care of the bull to the satisfaction of the Federal Department as they will have the animal inspected from time to time by one of their representatives.

Whenever possible, the bulls to be used will be purchased within the Province, thus protecting provincial breeders.

Last year thirty-five bulls were distributed to associations in New Brunswick. There are a number of districts in each county which are eligible to take advantage of this offer and the number of bulls distributed should be double that of last year. Farmers interested in this proposition should communicate at once with the Live Stock Division, Department of Agriculture, Fredericton.

To assist farmers to obtain or dispose of farm seeds The Soils and Crops Division of the Department of Agriculture offers to act as an exchange depot where correspondence of buyers or sellers of farm seeds will be received, their requirements placed on file and when possible correspondents will be brought into touch with other persons to mutual advantage.

The officers of Agricultural Societies will be advised of any seeds listed with the Department for sale.

The spring seed fairs to be held in the different Counties during March will give an opportunity for the display of samples. The exhibitor at these seed fairs is required to offer for sale a quantity of seed and consequently the Fair serves both buyers and sellers as a sample market.

The price of farm seeds has reached a new high level this spring. The annual importation of seed is enormous—our seed growers do not advertise, as their surplus quantities are rarely sufficiently large to attract big buyers, consequently many dollars worth of excellent seed never finds its way to a neighbor buyer.

Buy home-grown seed whenever possible, to the mutual benefit of the local seed-grower and the purchaser.

All persons who have a quantity of the common farm seeds for sale, or buyers who wish to purchase or exchange, are invited to list their lots or requirements with this Division.

Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 25. SUSSEX, NEW BRUNSWICK, FEBRUARY 17, 1920. Number 10.

Twenty-fourth Annual Convention of Nova Scotia Farmers' Association

The Twenty-fourth Convention of the Nova Scotia Farmers' Association met in Annual Session at Kentville, N. S., on Jan. 27th, 28th and 29th.

The meetings throughout were marked by a splendid attendance, and a keen show of interest.

The first meeting opened Tuesday evening with President, D. R. Nicholson in the chair.

The President's address was the opening number of the program, and was one of the outstanding features of the Convention. Mr. Nicholson received many expressions of congratulations, which were well merited for the concise and comprehensive manner in which he reviewed the past year from agricultural and economic standpoints.

Following is the address, which we take great pleasure in publishing verbatim:—

President's Address

Gentlemen:

For the first time in five years we are meeting with the shadow of the war' cloud removed. The Angel of Peace has once again winged her peaceful flight through the land and warring nations are at peace

Our own brave boys are home again and doing their "bit" now in the work of reconstruction.

Many of them received their first training in the art of war not far from this hall. With heads erect and shoulders squared, and hearts turned to the great sacrifice which time was to prove many were destined to make, they marched away from their own Province, the pride of Nova Scotia's offering upon the altar of civilization and Christianity.

We reverently look back and honor the sacred memory of those who never return and whose earthly bodies must forever lie under the sod "where once their own life's blood ran red."

The greatest loss of the war to our Country was not in material things, but in the power of young manhood that had fallen, 60,000 Canadian boys filled soldiers' graves over yonder. 125,000 more bear the marks of war. In how many homes today the aged mother and father are deprived of their sole support? How many widows and orphans today are dependent on our Country because the husband and father has made the great sacrifice and all that is mortal of him is now sleeping the long sleep under the sod "With each a cross to mark his bed and poppies blowing overhead."

We are pleased to note the stand taken by our Government with reference to the dependents of those who have sacrificed their all in the struggle for freedom. While the Government may not have met the returned men in all their demands they have been at least, fairly generous in their treatment of the dependents of those brave men. Governments may come and go but let us hope that the dependents of those fallen in the great struggle may never want.

It is my pleasant duty to welcome you to this thriving, progressive, inland town. The home of many of our Government Institutions, and to the opening session of the twenty-fourth Annual Convention of our Nova Scotia Farmers Association.

The season of 1919 was on the whole a very successful one for the farmer. Taking an average of all crops and taking prices into consideration it has been perhaps an outstanding year. True, every single item which goes to make up production was away up in price, but looking at the past season from all angles we come to this convention with gratitude in our hearts, and words of thanksgiving on our lips to the Great Ruler as we convene here tonight.

The Spring of 1919, like its predecessor, opened somewhat late , nearly a fortnight later than some preceding years. Seeding conditions were favorable from the 10th to the 24th of May, after which there succeeded nearly two weeks of cold, dull weather, delaying a large amount of Spring seeding until well on in June. Vegetation was very rapid during the latter part of June and July, but August and September will long be remembered for the continuous rainfall which greatly retarded hay-making and harvesting and caused a loss of thousands of dollars to producers of hay and grain.

Our apple crop, which has made Nova Scotia famous, was the second largest in the history of the Province, exceeded only by that of 1911. While prices have been high—from a producers' standpoint, taking into consideration the cost of labor, barrels, fertilizer and mony other things, returns have not been as satisfactory as anticipated.

The great enemy of the fruit grower, "scab," was prevalent, provided we can judge by the quality of fruit offered on the Sydney market.

We can report a full average hay crop,but owing to a season of wet weather, harvesting conditions were very unsatisfactory, and as a consequence a large portion of the crop was damaged in the making.

There were some frosts about the 20th of September which wrought considerable damage to tender crops. A very severe frost occurred again on October 20th that damaged thousands of barrels of apples.

The potato crop was a good average yield, but fields that were not sprayed—and alas there were far too many of them—were badly damaged by rot due chiefly to blight.

We have to report again that no Provincial Exhibition was held at Halifax. Before the close of this Convention our Exhibition Commissioners will inform us what steps have been taken towards the erection of new buildings and what the prospects are for 1920.

The Maritime Stock Breeders Association are to be congratulated on the success of the Winter Fair held at Amherst in December. After four years of inaction the general opinion was that the Fair would not be up to previous shows. Not only were all classes filled but some classes were the best ever. The result more than exceeded the most sanguine expectations of the Management.

County and District Exhibitions were held in greater numbers than ver before, and at many of these a very creditable showing was made and in many cases a marked improvement is noticeable, particularly in dairy cattle, grain and roots.

As the years go by one cannot but note the marked improvement in farm conditions and farm life. Much of this can be directly traced to the teaching of our Agricultural College and the Short Courses held there. The College, under the able leadership of Professor Cumming and a staff equal to any, has been working year after year to this end. Who could sit under the silver voice and earnest teaching of its Principal and leader, Profesor Cumming, without being inspired by his own earnest enthusiasm and lead onward and upward to better and greater things.

The student enrollment at the College this year is the largest in the history of that institution. This coming immediately after the close of the most destructive war in history is encouraging. Enrolled in the regular class this year and taking the full course, are one hundred and four students. Besides this there is a special class for returned men with an enrollment of forty-eight, and in addition to all these, there have been in the course of the year, thirty-five other returned soldiers who have completed the special course for soldiers.

This shows that our young men are beginning to realize the necessity of being fully trained and prepared for their life's work and are taking advantage of the agricultural training which our College is so well prepared to give them.

Very helpful and instructive Short Crouses were held at the College early in the month with a very satisfactory results.

It was my pleasure to have a chat with Miss Helen McDougall, Superintndent of Woman's Institutes for Nova Scotia, in Sydney a few days ago. There are at present fifty-five institutes doing excellent work. During the war the greater number of these instituts did Red Cross and other patriotic work. In some districts they are caring for the varying necessities of the schools in their respective districts.

As Miss McDougall is to address us tomorrow evening on this subject, I will not add anything further but to ask every delegate and member at this Convention to assist in every way possible the organization of an Institute in every village and country district in the Province. Their motto is all the introduction they require: "For Home and Country."

It is encouraging to note that the past season has been a very successful one for the creameries of Nova Scotia. A 20% increase in the number of pounds of butter and a 34% increase in the value of the product, is an encouraging report from the dairy farmers of the Province of Nova Scotia.

This, in view of the fact that mill feeds have been 50% higher than the previous year, is a wonderful showing. The price of mill feeds is a question that might stand some looking into. It looks rather unreasonable to give the Western Farmer an increase in the price of wheat—which means an increase in the price of mill feeds as a consequence—and at the same time holding investigations with a view to lowering the price of dairy products, especially milk, the production of which depends largely upon mill feeds at open market prices.

The Board of Commerce has been flitting here and there through the country like a bee among flowers. Investigations were held at various centres including Halifax, Sydney and Glace Bay. In nearly every case the products of the farm and especially milk was the outstanding question under investigation.

The Board of Commerce, together with several other "Boards" and Fair Price Committee were no doubt conceived in good faith, but in common street parlance they have been nothing more than a "joke." In the majority of cases they were composed of business men or retired citizens with little to do, and instead of investigating prices of commodities regarding which they might be expected to know something, they have attempted to vindicate their existence as a Board and curry local favor by pronouncing on the value of farm products.

As a rule they have shown lamentable ignorance concerning the cost of production, and the world-wide demand for food-stuffs produced on the land. The only power the yhave is to investigate, but without even doing that they, in some cases, issue a statement which is usually so far from correct that it is ridiculous.

When the armistice was signed over half a million men and women were taken from work in connection with the war, which brought us face to face with social, industrial and economic problems such as never confronted us bfore. We looked for a decline in prices prevailing during

the war period. The public e pe ally looked for a decline in the ... of farm products. The results ... all know. Prices were never as h... and still advancing, and rightly so.

The industrial worker to day is clamoring for, and in most cases has obtained an eight-hour day. Compare this with the farmer and especially the dairy farmer who works from eleven to thirteen hours a day and even then has been feeding the world with dairy products at a loss for the last five years.

The public are clamoring for cheap food, but it is willing to pay more for sheoes, for clothing, for furniture, for transportation and many other things. The question naturally arises in our minds, why should the farmer be singled out for such treatment? If on the one hand an increase in wages is justified that a fair standard of living may be maintained for the wage worker, the increase should also hold good in the case of the agricultural worker on the other hand. Farmers are not going to produce food on the Chinese scale of living. Prof. L. H. Bailey, in an address said: "We cannot have a democracy with an American standard for industrial workers and a Chinese Standard for the agricultural worker. Our democracy is made up of men and women, not of corn and potatoes. And the cities gain has cost the country dear in the abandoned farms, weakened schools and churches and discourged communities drained of their vitality. Country life must be satisfying, financially, socially and intellectually."

But the urban centres today are absorbing our rural populations at an alarming rate. The distribution of our population is fast altering the appearance of the landscape and the vry complexion of our national life. Let us see what the following figures reveal:

The Canadian census of 1891 revealed a population of slightly less than five million, 70% of which was rural. By 1901 Canada was the home of five and a third million people but 62% only were found to rural. The last census, or that of 1911 showed a total population of 7,204,838, but the percentage of rural people had dropped to 54%.

The trend citywards has been obviously increased by the war. Money flowed freely in high places. Plants working on war orders drew labor from far and wide, and left the country still more destitute. We will have to perform a complete "right about face" and make it possible for those engaged in agriculture to be thrifty and prosperous. Farming must be made attractive. There must be returns for labor expended on the land. The product of the soil must find a remunerative market that will leave a profit over and above the cost of production so that rural people may improve their surroundings, have home comforts, better educational facilities, and an all round fuller life. With these things possible rural life will be brighter, the rural population will constitute a larger percentage of the whole, and discontent will be less common; we can never get anywhere with only 37% of the population engaged in farming. The Government should turn their attention to the seat of the trouble, which will be found in the country—not in the city.

But we are living in a time of trends and changing conditions. Some are alarming, others again are reassuring. One thing we would like to believe is: That the city and country people are beginning to know each other better, and as a result are taking a keener interest in each others affairs. Around town certainly there is much talk of the farmer. Every now and then the hard word "profiteer" 'is used in this connection. But, are farmers making enormous and unjustifiable profit out of farming? The facts do not show that they are. They are certainly making more money thnan ever before—but they never made any money before.

But the tenor of talk matters little, the main thing is that the city man, after all these years, is now becoming interested in the farm and the farmers business. The farmer, beyond a doubt, has always ben interested in the city man. For generations we have been envious of the comforts of city life, with its labor saving devices and short hours of work. Within the past few years we have acquired many of these things. The gas engine has cut off much of the old drudgery. The telephone has put us into quick and effective touch with our neighbors and markets. The automobile and motor truck have brought the city and the markets almost to our door.

But farmers are not organized for their own protection. The "Farmers Movement" is at the present time engaging a great deal of attention and deservedly so. It is a gross error to regard the desire of the farmer to take an organized and direct hand in the Government of the country as a "Class Movement." Farmers are not a class, but simply the rural dwellers and rural workers of the country. We are the most numerous and most representative people in the Country. We are, and always have been, unorganized industrially. We have at all times been ready and willing to share the common lot—in fact we have proved ourselves to be unselfish. The consequence has been that we have been elbowed out and almost excluded from participation in public life.

This "Movement" however, is rapidly spreading and we cannot ignore it. At the same time, this Asosciation being a Government aided organization, it might not be well to discuss politics.

I have been attending the Annual Convention of the Farmers' Association regularly for the past fifteen years, and while we have been seeking for legislature affecting every phase of farm business and farm life —and quite successfully too—we have never to my knowledge looked for any legislation towards improvements to our rural school system. From year to year larger appropriations have ben made for agriculture, technical instruction and higher education. To my mind the efficient training of the children in the common school is at least quite as important to the province as any of these objects. The common schools of any country are a greater influence in moulding future citizenship than any other agency. Money devoted to the improvement of the efficiency of common school work is a better public investment than grants in aid of any branch of industry. Teachers must be paid, not only decently, but handsomely, in order to get the kind who may be safely entrusted with our future citizens. We cannot expect best results with our schools manned by girls yet in their teens. I like to seen money spent on boys and girls—the best investment possible and one which pays the bigegst dividends.

Many of you who attended the Convention at Truro last March will no doubt remember the address of Lt. Robertson, Nova Scotia's Representative of the Soldiers' Settlement Board You will also remember the lengthy discussion that followed this address and the unmerciful manner in which the Soldiers' Settlement Act was criticized.

In looking back over the past season we find that the returned men did not see it in the same light as the delegates and members of this Association. After less than a year in operation in the Province we find that the Board at Halifax dealt with 997 applications for certificates and 701 were qualified. 24 men took the practical training course at Kentville and at present there are 21 men training with practical farmers.

The Board has placed on farms 229 settlers. The Counties of Pictou and Cumberland having the largest number. Kings, Hants, Annapolis, Colchester and Cape Breton are well up to these Counties.

The Board has approved of 313 loans to the amount of $941,743.86. There are at present 23 loans pending which will run the total amount of loans in this Province well over the million mark.

The training work conducted by the Soldiers Settlement Board at the Experimental Station, Kentville has been under the direction of P. L. Sanford and he has had placed at his disposal by the Superintendent at the Station, teams, equipment and materils necessary to carry on practical farm work.

One hour each day was given to lectures on agriculture by the officer in charge or some of the Station Staff. Three hours each day were given to live stock work including milking and feeding and managing cattle and horses.

In addition to work in horticulture practical work in the management and care of farm crops, including cultivating and harvesting of field crops was undertaken.

An area of roots, corn and hay were set apart for their management, and a field of 5 acres was given over to them for practical work in plowing, discing and seeding.

The men were housed in a building erected on the pichic grounds at this Station with a suitable cook house and dining room in an adjoining building.

This work was discontinued for the season on November 30th and the majority of the men in training have secured places with farmers for the winter and will probably secure farms of their own next spring.

The Committees have endeavored to be fair and keep only in mind the welfare of the setller. The qualification Committe does not consider it a kindness to grant a certificate to a returned man who has not had experience to give him a fair chance of success. The Advisory Loan Committee have endeavored not to purchase farms for settlers, unless they afforded him a safe prospect of making good. Some will, no doubt, "fall down" as might be expected among so many, and so much depends upon the "man."

The result is very satisfactory for less than one year's work. This is a real "back to the land" movement. It is very encouraging to see so many of our young men settle on the land in their own native Province instead of taking up land in the west. We are anxious to keep our men in their own County, where returns are sure, to keep them at home.

The Agricultural Station at Kentville has again a very successful year in the prodution of home grown turnip and mangel seed. While the quantity porduced was materially less than the season of 1918, yet returns were very satisfatory. 5 tons of turnip seed were raised at an average yiled of 1,000 pounds per acre, and mangel seed grown yielded 1,400 lbs. per acre. The bulk of this seed was produed on rented land and the most part of which was old pasture ploughed the previous fall, and was not satisfatory for the purpose.

We have learned from these experiments that lean, home grown seed will produce better results than imported seed.

And now as we have entered upon the period of reconstruction — of building up again—let us as farmers nobly shoulder our share of the burden and go forward. Never before has such sorrow and sacrifice been experienced, and right nobly was it borne, with the hope that something great and worth while would be the result. That from the awful depths of agony to which we have gone we might rise in newness of life and push forward to greater things, having shaken off the shackles which bound us and retarded our progress.

What the future holds is hard to predict, and would be but a guess on our part, based on our fondest wish, yet we cannot help but look for great things, not only in a financial way, but in ways which will bring real happiness and enjoyment of life; and while we hope for greater things let use remember that the way to realization is to "Attempt Great Things, Expect Great Things."

We must retain our faith in humanity and our fellowmen, else our sacrifice will be in vain. No one must shake our confidence. We must be ready to say with Browning:

"God's in His Heaven,
All's well with the world.'

Good Roads

The Hon. H. H. Wickwire then addressed the meeting and extended the hearty welcome of the citizens of Kentville to the visiting delegation.

Mr. Wickwire said he had been struck by two features of the President's address, the making of the farming occupation a more pleasing one, and the plea Mr. Nicholson had made for the improvement of our rural school system, two subjects which he felt should receive more attention. He felt that the work on which he was engaged was helping to make farming a more pleasing occupation.

Good roads bring the farmer nearer his church, his doctor and his market, and make farming more profitable.

There had been a great change in the highway laws during the last two years. The Province of Nova Scotia had taken a great step forward, and he was happy to say that this change in the road law was made with the unanimous consent of the Legislature.

Nova Scotia had for many years been behind the times in this respect, but when she did make a change it was a radical one.

But this road law, Mr. Wickwire was afraid was not fully understood, and was not receiving the attention that it should. He then went into the provisions of the road act, and the problems which they are up against in administering that law. Statute labor under this new law was abolished and instead this expense was met through the automobile tax, a Government grant, tax of 40c on the $100, and a tax of 1/10 of 1 per cent on the assessed valuation of the town, that amount spent exclusively on the county in which it was raised. Did the farmer realize that with the old law every man over 16 years of age had been required to do three days road work, the equivalent now of $3.00 a day? Their taxation, did they but see it, was less than 100 years ago.

He commended the counties of Cape Breton, Annapolis and Guysboro on voluntarily increasing their tax from 40c to 60c.

Mr. Wickwire told of the grant from the Government to the provinces, of $20,000,000, for a period of 5 years, for the providing of good roads. Nova Scotia's share of this being $300,000. This calls for roads of a certain character, and money to be expended on intercounty and market roads only. There are 18,000 miles of road in Nova Scotia, and Mr. Wickwire hoped during the 5 years to complete 5,000 miles of road. He hoped that all would be so impressed by the etxent of the work to be done, that they would be ready and willing to pay a little more towards the maintenance of these roads. If the road law relieved the farmer of all responsibility for 40c of the 100, he should consider he was getting off easy.

He went on to show the different attitudes of mind in regard to this road law.

On the matter of the removal of snow, he would say that the law remained the same as in the last ten years. It was the duty of the municipal council to make districts and of them to appoint an overseer in each, and his duty to summon men in his district from 17 to 60 years of age, who were compelled to answer this call on penalty of a fine.

This law, he did not believe, would be changed, as it was something that

could not be estimated. It can only be handled in this way. The removal of snow could only be considered as a necessary extra burden.

The proposition made last winter asking to be permitted to add to their tax to look after the removal of snow, he did not consider a good one.

Mr. Wickwire solicited the co-operation of the people and the proper financial support, which, with the honest administration of the act, should give Nova Scotia a system of roads equal to any.

He closed his remarks with the hope that the deliberations of the session would be productive of much good.

Live Stock Opportunities of Nova Scotia

An address on Live Stock Opportunities of Nova Scotia was then given by H. S. Arkell, Live Stock Commissioner of Ottawa.

Mr. Arkell was greeted with an air of attention and expectancy, it was probable in the minds of all that in the course of his remarks, the great question which had been occupying their minds and was of paramount interest to them, that of the erecting of an abattoir and stock yards for the Maritime Provinces, would be referred to.

But the nature of the decision in regard to this, which he announced to them, came as nothing short of a bomb, and left indignation and rebellion in its wake, and undoubtedly hastened and advanced the feeling of need for the organization of the United Farmers' Union, which was consumated at Kentville, after the close of the Farmers Association Convention

The great need of an abattoir and stock yards had been so apparent to the farmers of Nova Scotia and their sister provinces, Prince Edward Island and New Brunswick, for so long and their claim so justified in their minds, that it seemed hard for them to conceive that their request had been turned down, and that they were not resigned to the decision was certainly evidenced in the resulting discussion the following day.

Mr. Arkell's address appears elsewhere in this isue.

Wednesday, 9 a. m.

Report of Directors

To the Members of the Nova Scotia Farmers' Association:

Your Directors in presenting their report wish to welcome you delegates to this twenty-fourth Annual Convention. It is some years since we met in Kentville, having since then met at various place form Yarmouth to Sydney; the last three meettings were in Truro and it seemed at one time that Truro was to be the annual meeting place, but the enthusiastic invitation we received from Kentville decided us to call the meeting for here, and we know we have made no mistake.

A program has been prepared, which we trust will meet with your approval and from which you no doubt will get form the addresses and discussions some further light on your work and undertakings that will be of value. Outside of the "Movies" as places of amusement, they are more being used for educational purposes. The Agricultural College has a machine and several films along agricultural lines, and also the Dominion Atlantic Railway; both of these parties have loaned us some of their films, which will be exhibited during our evening sessions, and we wish to express our apperciation of ther kndness for these loans.

The continued increase of living is a matter of great concern, and because of the inbrease in cost of farm produce many jump at the conclusion that the farmers are all growing to be millionaires. whereas they do not take into account the increased cost of transportation, handling, raw material, the jobbers and middlemen's commissions and profits, the scarcity of labor and increased scale of wages, and indifferent labor at that. Thanks to the agitation in favor of greater production and the mast favorable season, they were able to grow good crops and to reap some reward for the labor they toiled at, not for six or eight hours a day (and then went joy riding) but from sunrise to dark.

What about growing apples? At one time it was thought that they might be a very profitable crop, and apples are grown, with the after result of the enormous cost of transportation, increased cost of barrels, boxes and labor of packing and picking, that they are not very profitable to the grower, and will not be until the cost of transportation and labor is considerably reduced.

The transportation question should be always kept in mind, and all means taken to curb the continued raises, and also to go further and seek a reduction.

The years has seen the return of the remainder of our boys from the Old Country and scene of conflict, and we are glad of it. Some need a lot of asistance, care and help, and the Federal and Provincial Governments have done well in this line, and trust they will do all, in their power to repay them for their great sacrifices.

We regret to chronicle that during the year one of our oldest and foremost agriculturalists in the person of Col. Wm. A. Blair, passed away, and trust that you will have inscribed some suitable appreciation of his life in the interest of agriculture on the minutes of this Association.

The program speaks for itself, you know what to expect. Discuss all questions, you will be gainers thereby.

The Financial report is as follows and has been duly audited and found correct:

Balance Sheet, 1919

CREDIT

Balance Jan. 1	$ 376.68	
Government Grant..	1,000.00	
Delegates Fees	56.00	
Membership Fees ...	12.00	
		$1,444.68

DEBIT

Annual Meeting Ex...	$576,73	
Sec'y's Salary	150.00	
Legislative Com. Ex...	31.55	
Directors' Ex.	4.73	
Annual Report	136.05	
Postage, Tel., etc.....	13.87	
Stationery & Printing	7.65	
	$	920.58
Balance January 24, 1920..	$	524.10
		$1,444.68

The President spoke of the motion picture films provided for the entertainment of the Association. These films were owned by the Agricultural College and the Dominion Atlantic Railway, and were very instructive in character.

He also spoke of the lamentable death of Col. Wm. M. Blair, one of their oldest and most respected members, and hoped that some tangible recognition of his services to Maritime agriculture would be memoralized on the records of the Association.

Report of Exhibition Commissioners

Report of Exhibition Commissioners was given by Mr. Kennedy.

As far as the reorganization of the Exhibition is concerned, their work had been practically nil. The same conditions continue as in their report of last year in regard to the grounds. The Halifax Relief Committee still holding and no probability of any change.

Financially, there was a balance in favor of the exhibition of $5938.80, after the settling of all accounts.

On their claim of $225,000 damages at time of explosiin, they had received an advance of $35,000.

It was their intention as soon as grounds could be secured, to erect permanent buildings on an extensive scale, roughly estimated at a cost of $500,000.

Mr. O'Brien, as a member of the commission, said that he felt that in rebuilding, some plan should be evolved by which some revenue should be obtained during the 11 months of the year that the buildings had previously been idle. He believed the $50,000 grant was not now available, but that they were trying for the Federal grant which should have been theirs by turn when the war started.

This was promised, Mr. Kennedy explained, and Mr. E. M. Mason, commissioner, felt that if they insisted that they would yet be able to get this.

Mr. A. M. Griffin thought that after the annexing of the new piece of ground they had bought, that when the new grounds were planned, they should be the best east of Toronto.

Mr. Frank Foster said he was glad to know something had been received on the damages claimed.

He hoped the floors of the new buildings, when erected, would be of concrete at a height to prevent the rain from getting in.

He hoped that they would move the stock barns up and put the fakirs down in that corner by themselves, thereby pleasing those who do not wish to be confronted by this element on entering the grounds.

Mr. O'Brien said it was the intention to put the building on a concrete foundation, and also to put a judging stand on a level place in a prominent position, with accommodations made for people who wished to follow the judging.

Agricultural Societies Report

Mr. F. F. Fuller, Superintendent of Agricultural Societies for Nova Scotia, next reported on work done during the year.

Mr. Fuller said he would like to bring to their attention the new act that was introduced at the last session of the Legislature in regard to the scrub sire, Nova Scotia having the honor to have the most advanced legislation on this in the Dominion. But it was now necessary to have the boundaries of the Agricultural Societies legally defined in order to have this action effective. There must be no loop hole. Boundaries must be described correctly. Legal terms make it necessary to state number of miles without adding the words more or less, if it came to a law suit there might be trouble.

Of all the descriptions of boundaries he had received, Mr. Fuller did not believe he could get proof on one half dozen. Within the next month or two he proposed making some test cases.

He felt another matter that required attention was the turning down of their request of last year to have their Government grant increased $5,000. He advised each member to write to his county representative and push this matter until the grant was obtained.

In regard to the Field Crops Competitions, circulars were isued last year stating that all fields should be seeded with registered seed, it was later decided that this ruling was a little too stringent, the requirements will now be for registered or approved seed.

Registered seed purchased in recent years can be used if scoring 19 out of 20 points for purity, if contestant has been in competition for two years.

A list of registered or approved seed can be obtained by applying to Mr. S. J. Moore, Dr. Cumming or Mr. Fuller.

Mr. Moore at this juncture stated that registered seed was now obtainable at the Agricultural College.

Asked as to the probable cost of the seed he said it would probably be in the neighborhood of $1.50 a bushel f. o. b. for oats, $3.50 f. o.b. for wheat.

Mr. Fuller resuming his report, said the Agricultural Societies this year numbered 269, two less than in 1918. Members 10,116. Subscribed $24,732. There were 15 County Exhibitions held which were very successful in both attendance and exhibits, also being more than was held in any previous year.

The County Farmers' Association reported a decrease in number of meetings held.

Report moved and accepted.

Appointment of Credential Committee by the chair.

R. N. Jackson.

Mr. Wallace Rhodenizer.

Resolution Committee appointed.

Wm. O'Brien, Chairman.

Stewart Leonard, Wm. Murray, Walter Churchill, C. A. Munn.

Field Experiments

An address was then given by J. A. Clark, Charlottetown, on "Field Experiments."

This drew forth quite a discussion on various phases of the subject, the sparrow pest, methods of cultivation, poisons used for the eradification of bugs, etc.

Mr. Clark, questioned, stated he generally sprayed his potatoes before blossoming, had found 4-4-40 Bordeaux successful. Questioned as to mixing proportions of poisons, said he used 1/3 paris green to 2/3 arsenate of lime.

Questioned as to the different varieties of wheat, stated he had found Huron stood up best under disease. Marquis was alright until the trouble with the wheat scab.

This paper dealing with "Field Experiments", will be published in full in a later edition of the Maritime Farmer.

Dr. Cumming then opened the discussion on the address given by Mr. Arkell, on the previous evening. He said the city man is always asking why we do not produce to supply the local market. Farmers say it does not pay. Create a market and we will produce. There seemed to be no stable price throughout Nova Scotia. We are going to increase production of live stock, but conditions need to be such that the back sections of our Province will be benefited as well as others.

He then introduced Mr. Dougall, C. P. R. Agriculture Representative, and Mr. Fraser of the Davies and Fraser Packing Company, Halifax, whom he said were meeting with the Association for the express purpose of discussing these questions.

The discussion was now open to the meeting.

A. N. Griffen said he was disappointed at the remarks of the Live Stock Commissioner last evening, re the Stock Yard and Abattoir question, and the decision reached as to shipping their stock at the present freight rates it was not profitable. The people of the Maritime Provinces were entitled to something more in the way of assistance out of their difficulties. They could raise as much as Calgary and other places. They were not getting a fair deal.

Halifax wanted their products, but at much less than the same products would bring in Toronto. "There is a nigger in the wood pile" Mr. Griffin claimed. The Minister of Agriculture had promised that something would be done for them.

Mr. W. W. Pineo asked as to why they were required by Davies & Fraser to grade their pork, this was not done in the Boston market. It meant a top price for only a very few of their pigs, and wanted to know why pork was not worth as much in Halifax as in Montreal.

Mr .Fraser imports from Montreal only to compel the farmer of Nova Scotia to sell at his price.

Mr. Pineo said the farmers were tired of existing conditions, and suggested that they stop producing until these were changed. Produce enough to feed themselves and let others do the same. He had previously raised one hundred pigs, and was only raising two this year.

Mr. Chisholm, Bear River, said if the manufacturers cannot produce and export, how could the farmers be expected to do so.

In answer to this Mr. Arkell said that Great Britain was now manufacturing, so did not want to import, but she must buy raw material, she must buy beef, cheese, bacon, etc., which she did not have within herself, therefore Canadians stood in good stead agriculturally to reap the benefit over the manufacturer.

Mr. Walter Rhodenizer told of a case of the selling if pigs which cost $1000 to produce to Davis & Fraser, and only receiving $800 for them.

Mr. Frank Foster said that at the low margin they were making on butter and pork now, many feel they will not continue in the business. The prices received, contrasted with those of Ontario, were not enough. With corn meal at $80 a ton, if the farmer did not come out on the right side of the market this year, he will have to go out of the pork producing business. He wished to see the balance on the right side of the ledger.

Mr. Creighton spoke as favorably impressed by the assurance given of reduced freight rates, he felt if the farmers could put their stock in the Montreal stock yards at reasonable rates, then the Halifax markets would be compelled to give their price.

The farmer had borne a great deal, but he was glad to see he was at last getting his back up.

He thought if the Government was going to insure them protection as to getting lower transportation rates, he felt they might withdraw their demand for Stock Yards and Abattoir.

Mr. S. A. Logan said the Live Stock Commissioner had consulted with the packers and then said the packing plant would not pay down here. Of course, the railways preferred to haul our products to Montreal and then back to be shipped, it was to their advantage. The farmers were losing enough by such transactions to pay for running a packing plant.

Mr. Fraser called on, said this was the first time he had met a representative meeting of the farmers of Nova Scotia. There were two viewpoints to the subject, that of the producer and that of the business man or packer. He felt the producer was due for much credit, he felt if the packer and the producer got together more frequently, the results might be better.

His arguments in favor of the packer were not given much tolerance by the producers present. He claimed the packers did not quit buying because of price, but because he could not get any quantity, and pleaded innocence of his firm not knowing hogs were going there, when told of his firm sending last spring to Montreal.

Mr. Fraser said at the present moment hogs in Toronto were bringing 18½ cents live weight, at Halifax 24 cents dressed weight. He wished them to compare figures, which he claimed averaged the same as the packers claim Toronto has 25% shrinkage on the live weight of hogs. The packers only quit buying locally because they could not get the quantity. (Cries of put up the price and you will get the hogs.)

J. Howe Cox asked why not buy live hogs here, and obtained the answer that the packers did not consider the handling of such small quantities feasible in that way.

As to the grading of hogs, as in the grading of fruit, the ultimate consumer fixed the price.

Light weight hogs were in favor at present. The housekeeper now only would buy the small ham or bacon from young and tender hogs, hence the larger price given for hogs from 120 to 180 pounds.

The consumer would not buy the heavy ham, thinking it from an old hog, therefore it is he who sets the price. The packer would have nothing to say if he could market the heavy hogs. If they paid the same price, the tendency would be to produce too many heavy hogs.

Questioned as to why his firm had let the quantity of hogs produced in Prince Edward Island last year go to Montreal and Toronto, he claimed that under the increased production campaign Prince Edward Island raised these hogs, but at the time his firm was not prepared to house such a quantity.

At this point in the discussion the lunch hour having arrived, the discussion was adjourned to be resumed later.

Wednesday, 2 p. m.

The meeting opened with an address on "Potato Growing", given by A. A. H. Margison of East Centreville, N. B.

Mr. Margison said there were five essentials to successful potato growing.

Proper seed bed, good plant food and fertilizer, choice seed, proper cultivation and spraying. He ploughed the sod in the fall, used the Robin's two man planter, had his rows 32 inches apart and always used high grade fertilizer, nothing else paid, well balanced fertilizer, 1 ton to the acre not less, more if necessary, he wished to impress upon them the need of plenty of plant food.

The quality of seed was most important. Seed was high now and there was too great a tendency to plant seconds. If seconds were used more fertilizer was necessary.

He preferred to cut seed by hand, rather than by the seed cutter. Cut from seed to stem ends, and cut stem ends larger. A great deal of disease is carried by tubers, knives should be disinfected if a diseased potato had been cut into. The degeneration of seed was one of the results of planting poor potatoes.

In cultivating he covered up with the horse hoe as soon as planted, then cultivate again just as they are peeping through the ground, and kept on cultivating until the last row was hilled up.

In digging, any digger will do in dry weather, but he had found the Hoover stands up best in wet soil.

Mr. Margison next dwelt on the great necessity of spraying. Spraying always gives the most marketable potatoes. He had used 4-4-40 Bordeau with best results.

In an experiment tried, results had given 112 barrels to the acre sprayed 7 times both ways, 90 barerls sprayed 5 times, while only 60 barrels were gotten off his check plot.

As to Poisons, Watson's Arsenate of Soda he had found very satisfactory. He had experimented with White Arsenic which gave good results, and was a very cheap poison, costing only about 6 cents an acre.

He used the 6 row sprayer. Both the John Watson and Brown Company put out good sprayers.

Spray often and the wore the weather the oftener spray. In spraying, do one side at a time, spraying down.

He used 40 gals. to the acre, and began spraying when plants were about 6 inches high. Best results found by putting poison in the first spray.

Asked if he had tried Dusting, he said he had done so last year with good results, but had done it with a hand duster.

Questioned, he said he thought the Mosaic due to the lack of potash, which was so hard to get during the War.

Where water has to be hauled the dusting was found to be a quicker method than spraying.

On the conclusion of Mr. Margison's address, the discussion of the morning on the Stock Yard and Abattoir question was resumed.

Mr. Cox asked Mr. Fraser if in his opinion they had any need for stock yards and abattoir, which Mr. Fraser answered by asking if any producer found any difficulty in marketing his stock?

Mr. Crane told of always having to throw in the hides when selling his steers, and asked Mr. Fraser why they always had to take off two to eight pounds off every pig. They had no redress for loss of weight. He said the Grand Pre Fruits Company was going out of the live stock business.

Mr. Pineo thought a number of the buyers were working on commission and that often that was the cause of the different prices offered.

Mr. Fraser said the difficulty seemed to be in getting their price, rather than in the disposing of their stock.

Claimed there was always a shrinkage, in freezing 3% additional shrinkage.

As to the difference in the weight, perhaps the freight companys scales were wrong, railways were not always particular about their scales, a pound more or less meant nothing to them. But the scales of his company were always correct, they were always honest in their dealings.

Mr. Crane said the Grand Pre Company had made some investigations and found there was a general complaint against the Davis & Fraser Company. The farmers had been bucked too long and now they would have a stock yard and abattoir whether the government would give it to them or not.

Mr. Griffin though the people selling at stock yards had the advantage, as they sold at live weight and had nothing knocked off for shrinkage.

Mr. Crane drew attention to the fact that Davis & Fraser stopped buying in the summer and then when their pigs got heavy, gave them the small place.

The farmers of Nova Scotia had the long haul for their feed, and now to ask them to haul their stock to Montreal and haul it back, as not a square deal.

Mr. Fraser said it was just an economic question as to whether it paid to raise pigs or not.

The general impression among the farmers was that the business man was trying to buy cheap and sell dear, and tried to show the kind farmer how this was not so, that if they made a large profit it only meant a larger business done, not that it had cost the country one cent.

If the farmer did not like their methods of doing business, the only way to override this was to become the packers themselves.

If they did get stock yards Halifax should be the site for them, it was absurd to think of taking their stock to Amherst or Moncton to be killed and back to Halifax to be marketed.

There is a market of from 200 to 250 carcasses in Halifax a week, and about the same in the Sydney districts.

Of the former, Nova Scotia only supplied one quarter and not any to the Sydney's, and he assumed the butcher was willing to pay the same price for the same quality as he could get in Toronto.

There is a market for more beef, eggs, cheese and hogs, etc., than you are producing. Millions of dollars are going out for food products, he would like to ask why these are not produced.

Mr. Newcomb, in answer to that question, said he thought Nova Scotia had some natural disadvantages in producing, some parts of the country being rough and rocky, back from the rivers in many places it was not suitable to the production of stock. They could not expect to compete with Ontario, where the soil was so much richer.

Mr. O'Brien said that they had to pay too much for their feed to raise cattle to any extent, and until this and the exhorbitant rates charged by the railways was changed, not much could be done.

Mr. Slaughenwhite thought the wave of farmerism sweeping the country would soon change all this.

Mr. Dougall, C. P. R. Agricultural representative, said Mr. Arkell and he had been accused of being in colusion to favor the railways, which he denied.

He went on to tell of his branch of work, of belonging to the United Farmers of Ontario, and what they were able to do co-operatively, and the methods in the other markets of grading and putting the price on cattle.

As to the railways, decreasing the rates, he said Mr. Hanna, President of the C. N. R., had given out that unless they increased their rates, at the present cost of operating the railways, they could not continue.

Rev. R. L. McDonald asking the present freight rate per 100 lbs. from Truro to Montreal, was told approximately 40 cents.

Mr. Arkell said he did not know when delivering his address he would precipitate such a discussion, he wished to state as regarded the commitment said to have been made by the Minister of Agriculture re stock yards and abattoir in the Maritime Provinces, that to his knowledge the Minister had not so committed himself. He, himself would work for this as soon as it appeared practicable, but at the present he could not see it on the basis of a good business proposition.

If the packers and railways refuse their help, he could not induce the Government to do so, and would have to assist them in some other way.

The whole marketing system of the Maritime Provinces had been at fault. There had been similar difficulties in the West due at the time to the falling down of their marketing system. Don't blame the packers, sit down and find the solution.

There should be a better understanding of the markets. hTe Maritime Provinces are not informed on the market report as they should be, there should be a publication of these reports each day in your paper.

We are prepared to put a man here who will report on conditions in the Maritime markets; it will soon be known if it will pay to ship to Montreal. If it won't pay, then it means you are getting the full price here that the market warrants.

We must operate on a basis of cost and supply.

Dr. Cummings then addressed the meeting. He said before the Live Stock Commissioner left, he thought it would be well to get down to something of a tangible character.

There was some doubt as to the practicability of establishing stock yards and abattoir, but it would help if they get a cold storage plant in Halifax, one on a large scale to take care of domestic produce.

It would help temporally to solve some of the difficulties and eventually to get all they wanted.

Mr. O'Brien moved that a committee be appointed to draw up a resolution to that effect. This was getting down to practical business.

1920 Seed Situation

Mr. S. J. Moore followed this discussion with an address on "The 1920 Seed Question."

Mr. Moore was pleased to say that the seed situation was easier in the Maritime Provinces than it had been for years.

He reviewed the seed question of the last few years, the oat crop had been the cause of the most trouble.

Prince Edward Island has a steadier oat crop than any other place in the Dominion, and so far Nova Scotia had to get her supply from there.

The fault of the oats here seems to be that they are not as bright as in the West, and weight lighter.

This year Ontario has the worst grain crop in years, and parts of the West are short. Parts of Quebec has also to be supplied.

It would be folly to go West for seed oats this year, fo rthey are getting their supply from P. E. I. Better to send theer at once.

Mr. Moore said the Seed Board was giving inspection to the farmers clubs Association or Agricultural Societies. He would be only too pleased to buy and inspect.

The price is not liable to go up, but the quantity available is small.

A hundred thousand bushels going from P. E. I. to Quebec alone. He told of the co-operative handling of these in the Island.

During the past year a standard has been incorporate din the Seed Control Act, the same as for clover. Three standards for oats, barley and rye Extra No. 1, No. 1 and No. 2, and de

initely defines what each shall be. This definition on page 263 of our an. 20th issue.)

Mr. Moore said he was glad to see he farmers were growing more of heir own seed, and the idea of buying eed from abroad abating.

The Western frozen seed oats, which ome of them had received in the ast, had helped to cure that.

He went in to show what it would ake to seed this province as it should e seeded.

The trouble of raising Timothy seed n Nova Scotia was due to the ox-eyed aisy. But although they could not row it commercially, they could aise their own. It was very import-nt to get a good strong growth.

But clover seed was different, they ould all grow that, and as the price ad steadily been advancing since une, it was to their advantage to do o.

Get a hardy strain, he preferred arly clover. He thought the Rainy iver Ontario Clover Seed would be uitable to Nova Scotia, it was a fi-rous rooted clover. Ordinary clover eed you buy and raise a poor strain. eed grown at home will come through he winter better than the imported.

In the Western part of Nova Scotia here would be no difficulty in raising ood seed from the second crop. The rst crop best in Eastern Nova Scotia. Cut your hay earlier, you won't lose lthough you may think so.

There will be a Clover Seed Com-etition all over the Province this ear in the Fields Crop Competition. Raise your own and you will have lenty to seed with.

There are three hullers in the Prov-ce, one at the College and two bon-sed by the Government.

Dr. Cumming was also going to put n a competition in Turnip Seed Grow-ng. If you wanted good seed, get it om some of the Dominion Experi-ental farms. Old seed will not grow. Make these competitions a success.

After some answering of questions rought forth by this address, the e-ting adjourned.

Wednesday, 7.30 p. m.

For Home and Country

The first address of the evening was iven by Miss Helen J. MacDougall uperintendent of Women's Institutes or Nova Scotia.

Miss MacDougall told briefly of the rganization of the Women's Institutes 4 years ago at Stony Creek, Ontario, grew out of the real need of the omen, and of its connection with the epartment of Agriculture.

Fifty years ago the Hospitals, Sani-riums and Asylums of the West were argely recruited from the rural dis-ricts Six years ago they organized n Nova Scotia, now having 57 branch-s.

The Home life is the most valuable sset of an nation. The individual omes may not be considered, but heir status is the status of the nation.

The wealth of a nation is depend-nt on the health and purity of its omen and children.

The farmer studies stock, feeding, oils, crops, fruits, market conditions, abor saving methods, machinery and arm accounts for financial returns. The women study Home Economics, oods, Home conditions, Sanitation, ome Nursing and Care of Children, abor Saving methods and machinery or such, for financial returns.

Home machinery on the average arm is 50 years behind the agricultur-l machinery.

The Institute has been of inestim-ble value. They are needed to help olve more of these rural problems.

There is 37% of our population liv-ng in the rural districts, the home ife on the farm must be made more ttractive for the women or they will ot want to leave the towns.

Miss MacDougall was followed by an ddress on "Home Grown Birds" by rof. J. M. Trueman, followed by a light discussion. This paper will be ublished in full in a later issue of the Maritime Farmer, as will also be the address on "Limestone as a Factor in Present Day Agriculture" given by Prof. Blair.

After these excellent and instructive papers, motion pictures were shown and meeting adjourned.

Thursday, 9 a. m.

Report of Credentials Committee.

Mr. R. N. Jackson as chairman of this committee reported 47 delegates present. 1 from the Fruit Growers' Association, 26 from Agricultural Societies and 19 from the County Farmers' Associatios.

Report of Legislative Committee

Your committee went to Halifax in due time and presented before the Agricultural Committee of the House of Assembly those resolutions passed at your last annual meeting which could be dealt with by that body.

We were very courteously received and the actual discussions showed that the members were at least interested in the questions raised. The Scrub bull question evoked much enthusiasm and as a result we have the following Act.

An Act to Encourage the Improvement of Livestock

Be it enacted by the Governor, Council and Asembly as follows:

1.—In this Act "Scrub Bull" means an uncastrated male calf or bull, the progeny of parents either or both of which are not registered or eligible for registration in a Herd Book recognized by the Nova Scotia Department of Agriculture. "Pure Bred" means a bull registered or eligible for registration in a Herd Book recognized by the said Department of Agriculture.

2.—Except as in the Act otherwise provided no person shall own, keep or harbor any "Scrub Bull" more than nine months old without obtaining a permit from the Provincial Department of Agriculture and not even then unless such bull is kept in a stable or paddock or pasture with walls or fences of such construction that he cannot get out.

3.—The fact that a bull has broken through such a wall or fence shall be prima facie evidence that such walls or fences were not of proper construction.

4.—In the case of a bull kept in a paddock or pasture one or more sides of which constitute boundary fences the cost of construction shall rest upon the owner of the bull.

5.—Any person may castrate any "Scrub Bull' which he finds unaccompanied by an attendant on any public highway or common or trespassing on any field not securely fenced to prevent the passage of such bull, or otherwise not under proper control.

6.—Any Agricultural Society may appropriate out of its funds a sum not exceeding twenty-five dollars in any one year to pay for the services of any person or persons whom they may employ to castrate any "Scrub Bull' unaccompanied, trespassing or not under control as aforesaid.

7.—In any case where it is impractical for an owner of a cow to procure the services of a pure bred bull such person may on a statement to this effect sworn to before a Justice of the Peace and on approval of the Superintendent of Agricultural Societies, or an officer appointed by him, obtain from such Superintendent a permit to keep a scrub bull for a time fixed by such permit; in any such case the Superintendent of Agricultural Societies may, pending further enquiry, issue a special permit.

8.—The Act shall come into force by a proclamation by the Governor-in-Council on January 1st, 1920.

9.—Every person violating or failing to comply with any of the provisions of this Act shall be liable to penalty not exceeding one hundred dollars.

Prize Animals at County Exhibitions

Resolved that in the opinion of this Association First Prize animals in the various sections at County and District Exhibitions may be compelled to compete at the Provincial Exhibition, at the discretion of the Superintendent of County and District Exhibitions and that the Provincial Legislature be requested to enact Legislation to provide ways and means of defraying expenss in connection with such Exhibits.

Further resolved that this Association request the Provincial Exhibition Commission to hold their Exhibition at such dates as would make such arrangements convenient.

An Act Respecting the Annual Provincial Exhibition

Be it enacted by the Governor, Council and Assembly as follows:

1.—The Governor-in-Council may appropriate a sum not exceeding $—— —— to assist in paying expenses of transporting first prize animals in the various classes and sections at County and District Exhibition to the Provincial Exhibition.

2.—The Governor-in-Council may pass such regulations as are necessary for the carrying out of the provisions of this Act.

For some years the Farmer's Association has been asking for legislation defining a lawful fence as one which will turn sheep. We went into this matter fully, the Attorney-General interpreted the present law as ebing fully adequate to cover the requirements, but promised to so revise the wording that the meaning may be more easily understood. The following clause of the Act was the one under discussion:

An Act to Amend Section 2, Chapter 93, Revised Statutes, 1900, "Of Fences, and the Impounding of Cattle."

Be it enacted by the Governor, Council, and Assembly as follows:

1.—That Section 2, of Chapter 93, R.S.N.S., 1900, be repealed, and the following substituted therefor:

2.—All fences of enclosed lands shall be built of stones, pickets, boards, logs, poles, brush or posts and rails or posts and wires, barbed or plain, and shall be so constructed as to inclose animals, unless the lands are bounded by unfordable ponds, rivers or the sea, or surrounded by efficient hedges.

The resolution regarding the destruction wrought by deer in some sections of the Province was discussed in both the Agricultural and Law Amendments Committees and was finally referred to the Game Commissioner with recommendations to amend the present law so the farmer may protect himself against these animals.

Agricola

Resolved that the Nova Scotia Farmers Association memoralize the Provincial Government to erect either at the Agricultural College, the Provincial Building or other appropriate place a fitting tablet commemorative of John Young on this hundredth anniversary of the appearance of a series of epoch making letters written by him under the pseudonym of Agricola, which letters were responsible for a development of agriculture in Nova Scotia the influence of which is still apparent throughout the Province of Nova Scotia and to perpetuate his memory by a re-publictaion of the said letters.

The above resolution was favorably received and the suggestion will no doubt be carried out but some demur was made to the idea of republishing his letters.

Resolution re Increase of Government Grant to Agricultural Scoieties

Whereas, owing to the great increase during the past five years in the number of Agricultural Societies gives a very small grant to each individual society when distributed,

Therefore resolved that the Nova Scotia Farmers' Asosciation in convention at Truro, composed largely of delegates from the Agriclutural Societies of the Province urge the Provincial Government to increase the present grant to $20,000.00

In regard to an increase of grant to Agricultural Societies the idea seemed to prevail that the necessity of strict economy would compel them to refuse any increase for this purpose.

All of which is respectfully submitted.

R. J. MESSENGER,
S. A. LOGAN,
Legislative Committee.

Resolutions

The following resolutions were adopted:

Whereas there is being marketed in this Province annually a large number of uncastrated lambs, and

Whereas lamb-buyers have to accept a large proportion of such lambs in the first carloads bought, which large proportion always results in a falling of prices, and

Whereas the difference in prices formally offered today between ewt lambs and castrated lambs and the uncastrated is one cent per pound,

Therefore resolved that the N. S. F. Association approve of the lamb buyers hereafter offering a still greater difference in price, say of two cents per pound, which in its opinion would result in careless farmers to look better after their flocks.

Moved by J. Archie MacDonald, seconded by R. L. MacDonald.

* * *

Resolved that the Nova Scotia Farmers' Association in annual session at Kentville January 27-28, 1920, again place itself on record as being opposed to the enactment of any so-called daylight saving law by the Legislature of Nova Scotia or the Parliament of Canada.

Further resolved that we protest strongly against the action of the Government Railways and other railways of Canada in advancing the clocks one hour as wos done in 1919 by the said railways.

Further resolved that should the United States railways at the demand or solicitation of dwellers in the cities of the United States advance their clocks on hour as was done in 1919 ada do not advance their clocks but arrange their schedules and time tables accordingly.

And further resolved that a copy of this resolution be mailed to the acting Prime Minister, the Minister of Canada, the Minister of Agriculture at Otawa, the Premier of Nova Scotia, to the Nova Scotia representatives in the Dominion Parliament and to the members of the Nova Scotia Legislature.

Moved by W. A. Bacon, seconded by H. L. Taggart.

* * *

Whereas the farmers of Nova Scotia are greatly handicapped in their farming operations by the lack of skilled help, and

Whereas the Canadian Pacific Railway, by offering cheap rates and other inducements, entice away from the agricultural districts of Nova Scotia during the harvest season, a large number of farm laborers, and in consequence thereof large quantities of farm produce remain ungathered, entailing a loss not only to the farmers, but to the Province of Nova Scotia,

Therefore resolved that this Nova Scotia Farmers' Association, in session assembled, protest against this action of the Canadian Pacific Railway in running their so called Harvest Excursion from Nova Scotia to the Western Provinces, and

Further resolved that a copy of this resolution be sent to The Honorable the Minister of Railways, and to the President of the Canadian Pacific Railway Company.

Moved by Wm. O'Brien, seconded by H. L. Taggart.

FEBRUARY 17, 1920

WANTED—CAPITAL FOR FARM DRAINAGE

Hundreds of acres of hay-meadows and salt marsh, at one time the most valuable agricultural land in the Province, is today devastated by freshets or tides, and is unproductive, while the price of their staple products,—hay and grain, has risen to an unheard of level.

It is an established principle of political economy that land limitation throws out of use a great deal of land on the margin of cultivation which, because of bad physical conditions, cannot profitably be fertilized and kept cultivated during periods of high ages. But these dyked marsh lands, the richest in fertility and crop-producing power in North America, will be allowed to remain waste land usless some successful ditching and dyking appliance shall be introduced to demonstrate the work of draining and reclamation.

The problem of land drainage is so closely connected with the agricultural, and hence commercial progress of this province, that unless capital can be diverted from the usual forms of investment and turned toward farm development of this kind, the scarcity and high prices of food supply must continue.

Educational and demonstration work in farm drainage has been carried on by State and Federal Departments of Agriculture, Drainage Congresses and Agricultural Colleges in many parts of the United States and Canada, and their work has frequently been followed by the ditching contractor who made splendid profits, or by the farmer himself, so effective and profitable proved the employment of machinery for drainage.

Excavating machinery for digging open ditches has been successfully used in Alberta and British Columbia, for digging irrigation ditches, and in most States of the Union, and it is reasonable to suppose that these marshes offer no obstacles to their operation. But local capital must be shown that in contract drainage work there is scope for a well arranged private business, and since there is no local data obtainable, our Department of Agriculture should be asked to investigate the suitability of the existing types of machinery and to recommend, and if necessary buy and operate as a demonstration feature, a satisfactory machine.

POTATO GRADING

Many of our most progressive growers and dealers are strongly in favor of a better system for grading potatoes. Here is what Mr. Henry Broughton, of Sarnia, Ont., is credited with saying in a recent issue of The Canadian Horticulturist:

"There is not a wholesaler in Toronto who would take the risk of ordering half a dozen cars of Ontario potatoes of a certain grade. By grading our potatoes we can establish the reputation of our own products."

The grading of potatoes will have the effect of establishing a reputation for that product that does not exist at the present time. The unscrupulous grower and dealer do not favor grading, as they will have no chance to palm off on the public a class of goods that has the very opposite effect.

THE RAILWAYS AND AGRICULTURE

It is estimated that agriculture contributes approximately twenty-four per cent of the total Canadian railway freight tonnage. According to G. E. McIntosh, the officer in charge of transportation in the Fruit Branch of the Department of Agriculture of Canada, Canadian railawys will this year have handled possibly 15,000 car loads of apples. In his article, which appears in The Agricultural Gazette for December, Mr. McIntosh points out that the country is today more interested in ample, safe, and rapid transportation than in cheap transportation. This applies to the fruit and vegetable industries even more forcibly than to manufacturing or other lines of industry. Groers and shippers, he states, in many producing sections of Canada are still marketing under adverse transportation conditions. Where the situation is such the Fruit Commissioner is prepared to afford the assistance of his Branch in an effort to strengthen the weak points. Mr. McIntosh concludes his article with the fololwing:

> "There is this to bear in mind, that proportionately to population, Canada is even better equipped in railway mileage than our neighbors to the south, who are five times better equipped than the European countries. This being the case, agriculture in all its branches and the railways of Canada are interdependent."

SEED ORDERS AND SUPPLIES

The new seed catalogues are coming in with their lists of novelties and staple varieties attractively advertised, and one gets much enjoyment in turning over the pages of one of these catalogues and mentally picturing the fine crops one will have next summer. Often, however, the catalogue is laid aside without the order being sent and nothing futrher is done until spring, when it may be too late to get what is desired. The quantity available of the best strains of vegetables and floewrs is usually small, hence it is very important to order early before the stock is exhausted.

There is a great difference between the best and the poorest strains. The stock of the best has been rigidly selected so that a large proportion will come true to type, whereas stock which has not been kept up by selection may have a bad mixture of types, and the resulting crop will be very unsatisfactory. This is of so much importance that, with a crop like the cauliflower for instance, where a strain that will give a large proportion of good heads means much profit and a poor strain may mean very little, it pays the market gardener when he gets a good strain to hold over what seed he does not use until another year as he will thus be sure of having a good strain next year. This method would not, however, serve with the onion, which loses its germinating power very rapidly, hence should be purchased every year. There is a wonderful difference in onions. Sometimes from the seed of one stock a large proportion will be thicknecks, while from another most of the plants make good bulbs. If one has had good success from a certain source one year, the safest plan will be to order from the same source another year.

Sometimes novelties have not apparently been compared very carefully with the best of the older varieties before being offered for sale, as they do not prove superior, if as good. While it is interesting to test varieties, it is well not to spend much money on them until they have been tested at the Experimental Station.

Another advantage of ordering early is that one can test the germinating power of a seed before spring so that there will be time to order again if the germination is poor. Often seed is ordered so late that when it is sown and the plants do not come up there is not time to order again, and one loses the crop. When there is a shortage of many kinds of supplies, as there is at present, it is very desirable to order early the material needed for next season's operations.

* * *

"Canada will find that livestock production will, from an industrial point of view, prove her greatest national asset".—H. S. Arkell, Livestock Commissioner.

* * *

A shortage of cattle is predicted by those who know. Farmers who can are strongly urged to extend breeding. The export markets can take all the meats that can be shipped from the Dominion for years to come. The returns will help to pay the war debt.

* * *

"This country will not be affected by the impending world shortage of meats until the end of 1920" is a recent tsatement of the British Food Controller. Canadian livestock producers will be quick to grasp its significance for their export trade.

* * *

"Sentiment won't bring trade to Canada if the manufacturers do not go out after it" pithily comments a Toronto morning newspaper. For the farmer the only possible manufacturer of his meat producing animals able "To go out after it" abroad is the packer.

* * *

Farm animals once depleted cannot be brought back to normal numbers so quickly as the supply of feeding grains. Disparities of price will right themselves soon. Our animal industry is in for a period of good prices. Through increased exports this can be made a durable condition if farmers wish.

* * *

Here is a pointer to Canada businesses United States banks and loan companies "are letting out all the money they can to farmers who will feed or breed."

* * *

Those who were helped by you will remember you when forget-me-nots are withered. Carve your name on hearts and not on marble.—Spurgeon.

N. S. A. C. Alumni Honor Their Dead

The Assembly Hall of the Nova Scotia Agricultural College, Truro, was filled to its capacity with students, ex-students, members of the Nova Scotia Dairymen's Association and many residents of the town when on Thursday afternoon, January 22nd, at the hour of half past three, the memorial tablet erected by the College Alumni Association was unveiled to the memory of twenty-two graduates and former students of the College who gave their lives in the recent war.

H. S. Cunningham, president of the College occupied the chair and read the following telegram of regret from Premier Murray, at North Sydney:

"Would like very much to participate at unveiling, but do not feel well enough to go. I am pleased a movement is being made to preserve the memory of brave lads of the Agricultural College who so unselfishly gave their all that justice and freedom might be maintained."

(Signed) George H. Murray.

With bowed heads and sad hearts the audience reverently listened while Dr. Melville Cumming, principal of the College, read the following moving tribute to the honor of the dead:

"We are met on this occasion to commemorate the lives and deaths of 22 young men, former students of the Nova Scotia Agricultural College, who during the progress of the war fell in the service of their country. The fellow students of these heroic dead have contributed to erect in the halls of this college a tablet that will preserve the memory of the names of their comrades. We are joining with them today in dedicating this tablet to its worthy purpose. To some of us the names inscribed on this tablet are very real, recalling, as they do, faces of those who frequented these college halls and memories of days gone by when, care free, their laughter and their talk mingled with that of fellow students and ourselves. They came to college to prepare themselves for lives of achievement and usefulness and service. Life was very dear to every one of them. But when their country's call rang in their ears they sprang to defend the flag that has ever been the symbol of that liberty and justice which they had always enjoyed. And they did not count life itself too great a cost to pay that these principles might forever be preserved for future generations in the country of their birth.

"Two of them died on this side of the Atlantic. The rest, so far as I have record, lie in Flanders fields. Even you who did not know them personally and who cannot bring them back to memory's eye, join with us in revering the memory of their services and achievement. They were fellow countrymen of yours and of us, and they died that we might be free. They have not lived in vain. They shared in th great triumph of the allied powers and their heroic deeds speak to us of our duty to serve our country and our fellow men in whatever capacity we may have the opportunity.

"Of all those whose glorious lives and still more glorious detahs we are commerating, it is but natural that as a member of the college staff I should particularly recall my colleague teacher, Lieut. B. H. Landels, who fell at the Somme in September, 1916. Those who were students during his period at the college will remember his conscientiousness, his indefatigable devotion to his work and his great interest in every student of the college. I heard from him frequently after he had gone overseas, and always he wrote about students of the college in whise welfare he seemed more concerned than his own. His special training had been as a drainage engineer, and as a tribute to his work in that capacity he "was mentioned in despatches." I have never met a soldier of his famous regiment, the Princess Pats, but told me of the great work which Sergeant, and later Lieutenant, Landels did in draining the trenches and making them comfortable for those who fought there. He was promoted to his commission on the field of battle and fell in action in an assault on the German lines a few days later.

The Heoric Dead.

B. H. LANDELS, River Hebert.

LLOYD HIGGS, Nappan.
LLOYD LONGLEY, Paradise.
NORMAN PARKER, Truro.
J. C. STEWART, Up. Malagash.
R. A. COLPITTS, Pleasant Vale, N. B.

"I have referred to Lieut. Landel's career in particular because of his long time asociation, both as a student and an instructor, in the college, but every one of the 22 whose names are inscribed on the tablet that is to be unveiled today, is fully deserving of the highest enconiums one could bestow on a fellow man. All were filled with the some devotion to their country and to the cause of liberty and justice.

"Though gone from our midst, the boys whose death we are commemorating today are still speaking, telling us that the highest achievement which any of us can arrive at in this life is devoton and servce to duty, to our country, our fellow-men and our God."

Hon. E. H. Armstrong, Commissioner of Works and Mines, in the Provincial Government, who unveiled the tablet, expressed his thanks to the president of the students body and to all members of the Alumni for the honor and privilege of being allowed to assist at the unveiling of a tablet in memory of those "whom you as members of the Aulmni really call our heroic dead." He was confident that all assembled joined with him in regrets that Premier Murray was unable, owing to illness, to be present at the unveiling of the tablet. The privilege of assisting in a ceremony which will perpetuate the names and memory of students of the agricultural college who had given their lives for Canada, the Empire and a righteous cause, was one which he was sure Mr. Murray would have held most dear. The action taken by the college Alumni in recording in so appropriate and permanent way their grateful rememberance of those dead to whom they were bound by unique ties of comradeship and love of alma mated, which is common to all educational institutions.

The record of the college in giving one hundred and fifty of her graduates and undergraduates to the cause was one to be proud of and it was the duty of those who are now at home to do their part in the honor of the College and the Empire and if they failed in that they will have broken faith with those who are so rightly named "our heroic dead."

In this time of industrial unrest and the just and unjust friction between capital and labor and unsettled conditions throughout the world it was the duty of every one to choose for his objective the goal of humanity and work towards that goal with unselfish singleness of purpose, and whether that goal is reached, if each has striven constantly for the fulfillment of that ideal, each will have achieved the same high soul and courage as did those heroes whose names were inscribed on the tablet which it was the speaker's privilege to then unveil.

The Honored Dead

The meorial tablet is of copper, with fluted Doric columns and has inscribed on it the names of the following heroic dead, which were read by the presiding officer:

When the tablet was unveiled the audience rose and Prof. W. E. Fletcher, organist at Immanuel Church, played the Dead March in Saul, followed by O Canada. Rev. J. W. Godfrey, rector of St. John's church, repeated the Lord's Prayer, the audience joining, and then offered a prayer of thanksgiving, after which the Dairymen returned to their deliberations, the students to their classes and the citizens and visitors to their homes, sad yet proud for the deaths of and noble achievements and sacrifice of our boys in the cause of right and freedom.

Farmers of Nova Scotia Organize at Kentville

At the close of the Farmers Association in Kentville, a meeting was called to ascertain the attitude of the farmers in regard to organizing along independent lines, as has been done by their fellow workers of New Brunswisk, Ontario and the West.

The large attendance that afternoon showed at once that the farmers were not indifferent to say the least.

Mr. Creighton presided over this meeting, Mr. Fred Chipman, acting secretary.

It was moved that they form an organization called the "United Farmers of Nova Scotia" and all were invited to speak on the question.

Mr. Richardson of Sydney, speaking to the question, said that the time had arrived when the farmers must protect themselves, and there was no way to do this but by organization, but hoped this would not be of a political nature.

Mr. Davidson, Falmouth, said he would like to have the Farmers platform as laid down by Mr. Crerar read at this meeting.

A copy of this was then read by Mr. Creighton.

Mr. Sloughenwhite said the farmers had now arranged against them the bankers, the railways, doctors and lawyers and their influence was great.

He thought it would be well to join with the labor unions.

Mr. Loughery of Annapolis, giving his opinion, said he was in favor of the movement, but all must drop their party politics, there must be no Liberals or Conservatives. He was against protection tariff.

Tariff was no longer in its infancy, he thought it could do nicely without protection.

He was very dubious about the advisability of amalgamating with the labor Unions.

Mr. Bacon said the leading farmers of Digby County from which he came, were in favor of organization.

For this there was good reason, the farmers had too long been slaves to other classes, they were the majority and the majority should rule.

Mr. O'Brien, Hants County, said he came with the intention of assisting in this movement.

He was in favor of any movement that would give the Dominion, a clean, honest administration.

The farmer never had had fair representation.

Rev. R. L. MacDonald, Cape Breton, was then called on.

He said he had not come with the intention of speaking, but rather to gather information.

It was a big question and one on which he was not prepared to give his views, but if in the estimation of the farmers of Nova Scotia, it would be to their interest to organize, they would have his full sympathy.

Mr. Ells read the new national tariff policy as outlined by the Canadian Council of Agriculture. He did not consider it at all radical and thought the arguments against free tariff based on wrong conclusions drawn.

Mr. Campbell, Inverness, did not wish to make a speech, but would say he was in favor of the movement.

Mr. Taggart, Colchester County, said the farmers of his county were interested and wanted some form of organization.

U. B. Leonard, Annapolis Co., would not speak for his county, because he did not know the sentiments of all, but said that the farmers were now awake and that they must in self defence do something.

HORTICULTURE.

INCREASING FERTILITY OF THE SOIL

An address before the Agricultural Society of Central Greenwich, Kings Co., N. B. by O. C. Micks, B.S.A., New Brunswick Dept. of Agriculture, on the subject, "Increasing the Crop Capacity of the Soil."

Mr. H. L. Bailey, once president of Cornell University, said that the requirements of a good farmer were at least four:

The ability to make a full and comfortable living from the land to rear a family carefully and well; to be of good service to the community; to leave the farm more productive than it was when he took it.

The subject for discussion concerns the first and fourth requirements, viz., Making a good living and at the same time increasing the capacity of the farm for growing food supplies.

The attainment of these two problems mark the successful farm. To succeed in these two features the farmer must do things. He must be a live wire in the farming business. There is a difference between the successful farm and the successful farmer, for a financially successful farm may be operated by a man who fails to educate his family and who may even waste his income. There are examples of men in every community who make a success of their farm management, due not to exceptional opportunity but to personal energy and initiative.

The successful farmer makes changes in his farm management to met new conditions of markets, or labor, or adopts newly invented machines and newly advertised methods of doing work. The District of Greenwich as a marketing system offered by the Valley Railroad. To what extent will it create changes in farming practices? Old habits are hard to overcome and too frequently when new conditions arise for the marketing of produce there are but a few who are eager and ready to change their system of crop growing to meet new marketing conditions.

Every person should not grow the same specialty even in a region of small farms. There must be diversity. By each person there are such things to be considered as: prices of the product; the condition of roads and distances from station; freight rates, and also the amount of capital available.

The profits to be made in an enterprise may be judged from the profits made by local growers and again the probability of your sharing equally may be gathered from a consideration of the following matters: (1) If many or few persons are producing the crop how will the extent of production influence the market? (2) Location: produce must be marketed in fresh condition. (3) Combines of dealers—are local farmers in any way organized? (4) Cost of equipment. (5) The effect of your enterprise on the fertility of your farm.

Orchards, small fruit and vegetable farms require heavy fertilization, and, as the income is proportionate to the extent of the acreage under crop large amounts of fertilizers are required. Many farmers keep stock that do not return market prices of feeds because of the effects of the manure upon the future crop yield. Farm practice then to accomplish the requirements of our text means more land under cultivation and bigger crops. Bring as much of the farm under rotation as possible. Waste parts of the farm should be cleaned up, stone piles removed, ditches dug to remove standing water or to carry water from brooks to moisten dry patches of ground during the growing season. Applications of lime, commercial fertilizers, barnyard manus and cover crops must be porvided for.

Such crops as cabbage, cauliflower and turnips do not thrive if water stands near the surface and these too frequently suffer from club root. The land for these crops must be well drained and made sweet with an application of lime.

Strawberries, celery, lettuce, melons and cucumbers and radish require irrigation to be crisp and juicy. In many places on the Atlantic coast irrigation by one of several ways is profitably employed.

The late Marshall P. Wilder, being asked what were the requisites for successful culture of strawberries, is said to have replied: "First, plenty of water; second, plenty of water; third, plenty of water.' A sufficient water supply enables the vines to carry out their fruit and to produce berries of good size throughout the entire season. The crop possibilities under judicious irrigation are enormous. On a small piece of land there is recorded a crop at the rate of 21,000 quarts per acre.

No amount of fertilizer and care can produce large yields, unless water is abundant, and the market gardener or farmer can ill afford to run any risk of a dry season any year. For this reason, any steps taken to increase the amount of water available for plant growth, even to installing an irrigation system, can be considered in the light of an insurance policy.

Water can be conserved by draining, where soils require drainage, so that the crop may be sown earlier and thus be enabled to root so deeply that it will successfully withstand drought. A mellow, deep seed bed and a surface mulch of dry earth, maintained by frequent summer cultivation, lessens evaporated losses. Additions of green manure crops and barnyard manure increase the organic matter content and the water holding power of the soil.

Organization among the farmers of a truck-farm region is a strong factor for success. Co-operation is an aid when selling and buying. For instance each man requires a small quantity of comercial fertilizers. Usually the requirement of each individual is so small that he does not buy what he wants in raw materials but takes what some agent wishes to sell him, to the advantage of the agent. By combining their requirements and making a club order raw materials can be bought at a big reduction. The material used in the manufacture of comercial fertilizers is more plentiful since the signing of the Armistice and high grade home-mixed commercial fertilizers can be bought at a price formerly demanded for low grade ready-mixed goods.

Truck crops must be forced to make quick growth. The profits of the market gardener depend upon his getting the crop upon the market before his competitor, and it is to his own advantage to quickly adopt new iedas, or trade conditions, to his trade. The prices of truck crops continue to rise and the demand increases with each New Year. Your nearness to the city of St. John—the best market in the Province, your new marketing facilities through the inaugurating of a daily express service on the Volley Railway, from your farms to two large cities—St. John and Fredericton, should be taken advantage of. Fertilizers for forcing your crops are cheaper than for years. What more promising combination of conditions is enjoyed by any provincial community ? Some there are among you who will continue to cultivate your land as before. Others, I trust, will fertilize the soil, drain, ir-

Eureka Potato Planter
Pays for Itself in Labor and Time Saved
One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.
Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. Furrow opens and seed drops in plain sight—an equal distance apart, at uniform depth, with absolutely no injury to seed. Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.
Write for free catalog on this great line of potato planters—the largest line made. Sizes for 1 or 2 rows, with or without fertilizer attachment. In Stock Near You. A success for over 20 years. Whether you are a large or small grower—write today.

Can You Grow Potatoes like this?

With a reasonably good soil and rainfall and the liberal use of Monarch Fertilizer, you can be sure of a potato crop superior in both quantity and quality. The potato shown in our illustration was grown by a New Brunswick farmer who is a consistent user of Monarch Fertilizer. He sent us this potato as a good average sample of his crop. There's no magic about it. Monarch Fertilizer is simply an efficient plant food, containing Nitrogen or Ammonia, Phosphoric Acid and Potash in readily soluble form. Its record of success is its truest recommendation. Write us to-day for our booklet, "Fertilizer Results by Satisfied Users." It will be sent free on request, and it will give you evidence in the shape of signed letters from farmers in all parts of the country who know by experience how profitable Monarch Fertilizer is.

GROW STRAWBERRIES
We WANT your order for STRAWBERRY PLANTS this coming season. Of course you are planting a larger acreage than usual,—everybody's doing it, for strawberry growing at the prices now days is a sure fire money maker. The Canning factories are anxious to buy all the berries they can secure, so we now have no fear of over production. Get our plants and be sure of big crops. Senator Dunlap, Warfield, Beder Wood and Dr. Burrell, six dollars a thousand. Sample, Glen Mary, Premier and Bubach seven dollars a thousand. We allow one dollar a thousand discount from these prices on all orders of four thousand or over of one variety. Send for Catalogue. It's Free.

rigate, add lime, humus and cover crops and leave their farms more productive than these are now.

NOTES ON GROUND LIMESTONE GLEANED FROM EXPERIMENTS AT THE COLLEGE FARM

The N. S. Agricultural College began to experiment with ground limestone in 1914. A application at the rate of four tons to the acre was made that year to a number of plots intersecting an area sown to grain and seeded down with clover. The total yield in the following season showed an increase of clover from the limed plots which amounted to 2.2 tons on ten acres.

Four years after this application was made, very striking results were noticed in the growth of clover. Plots were laid out across the limed and unlimed strips, and various commercial fertilizers applied to these, one strip being left blank. The following table indicates the returns obtained in cut and cured clover.

Limed	Unlimed
3687 lbs. per acre	1437 lbs. per acre
No fertilizer	
4656 lbs. per acre	3218 lbs. per acre
Bone meal (320 lbs. per acre)	
4375 lbs. per acre	5218 lbs. per acre
Acid Phosphate (400 lbs.)	
5000 lbs. per acre	5187 lbs. per acre
Basic slag (500 lbs. of 12.8 per acre)	

Plots limed in 1916 and sown to oats in 1917 gave the following returns per acre:

Variety	Limed	Unlimed
Ligoma.....	29 bus.	21.6 bus.
O.A.C., 72....	40 bus.	35.0 bus.

In the Control of Clubroot

The College experience has demonstrated that a heavy application of either air slaked lime or ground limestone will eradicate this dreaded disease. Even when a host crop has been grown four years in succession on badly infested land, this has proven effective. Such cropping is, of course, contrary to all rules of rotation, and has been done to test out the lime cure in the hardest possible conditions.

In 1919, turnips were grown on a field, half of which had been treated with limestone in the fall of 1917. The point where the lime application stopped was the point where the clubroot began. On a large part of the unlimed area the turnips were totally destroyed by the disease, while the yield from the limed are aws over 800 bushels per acre.

Clubroot can be effectively controlled with comparatively light aplications of lime if a proper rotation is followed. An host crop should not be planted more frequently than once in a full rotation period where there is infestation. Further details along the line of clubroot control may be found in the report of the Secretary for Agriculture, 1919, which will shortly be off the Press.

Lime Versus Basic Slag

The statement has been made that it is cheaper to buy lime in the form of slag than as ground limeston. This, of course, is not correct, since slag contains only a small amount of free lime. It must be remembered that the "A" quality of Sydney slag, which, by the way, is no longer on the market, contained 12.8 per cent. of soluble phosphoric acid. For this reason it might have paid better to buy the slag for some soils. So far as the lime content is concerned, however, the crushed limestone is the material to buy.

Varied Results on Different Soils

Experiments have shown that lime applications had no very great effect on crop yields where the land was already rich from the use of barnyard manure. On such land all kinds of crops yield heavily whether limed or not.

On the other hand, on a poor farm recently purchased by the Department, the use of limestone mixed with acid phosphate, half and half, gave splendid results in grain and clover. By the way, this mixture has been advertised as "Lime-Phosphate" and sod at rather high prices. There is no reason why the farmer should not buy the ingredients separately and mix them himself. With acid phosphate at $34.00 per ton, and ground limestone at $4.50, the mixture can be made for about $20.00 a ton. Used at the rate of 400 or 500 lbs. per acre this will be found a good dressing, especially for grain and new seeding.

Most of our land is too acid and the use of lime sweetens the soil. Especially valuable is it in the growing of all legume crops. Legumes Love Lime is an expression worth remembering. Every farmer knows that the legume family are among his best friends. They not only furnish him with some of the most appetizing and nourishing of his own foods, but in the form of clover especially they furnish a roughage that is rich in protein, and valuable in the feeding of all kinds of live stock. And this is not all, for these plants, peas, beans and the various clovers, return to the soil quantities of nitrogen, the highest priced material in any good fertilizer.

Lime Supply of Nova Scotia

While our soil is rather scant in its general supply of lime, there is an abundance of this material, now becoming so prominent in agricultural practice, in almost every section of the Province. Perhaps the most readily available is the marl deposits of Eastern Nova Scotia. Limestone, however, crops out at a great many points. There are now ten limestone crushers at work in the Province, and every advantage should be taken of this great natural store of valuable material.

Insects do not confine their depredation to plants by simply sucking the juices from them or devouring the foilage, but are instrumental in the transmission of plant diseases which if ont properly treated will spread to other plants and cause no little damage.

Frost & Wood

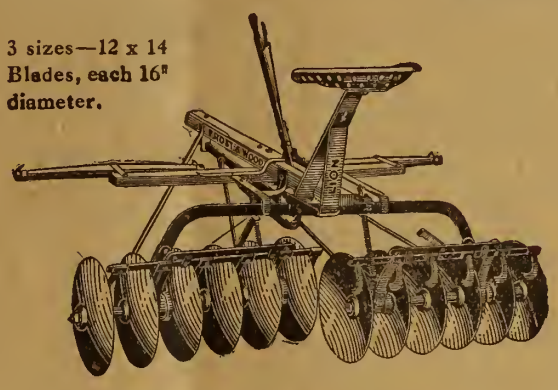
A good discing is the best start for a big harvest

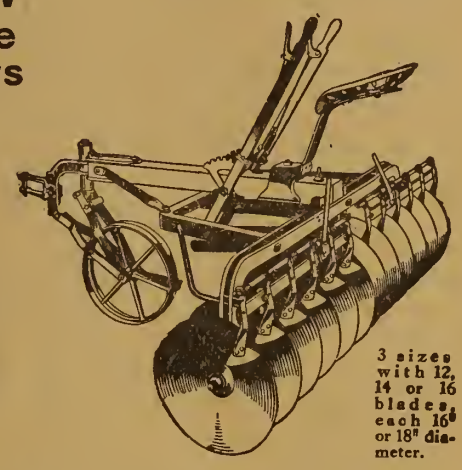
Give your soil the thorough pulverizing that only a Frost and Wood Disc Harrow can bring. It's a simple, easy job with these light draft implements.

Two "F. & W" favorite Harrows

A good seed bed is a long step on the way to a bumper crop.

3 sizes—12 x 14 Blades, each 16" diameter.





3 sizes with 12, 14 or 16 blades, each 16" or 18" diameter.

F. & W. "Lion" Disc Harrow

An old favorite of the In-throw type. Very strong and rigid. Heavy steel main frame securely holds disc sections which turn on dust-proof ball bearings of exceptional quality. One handly lever controls cutting angle of discs and coil springs keep inner discs from rising when angled. Driver sits well back over discs lessening neck weight. Fitted with pole instead of forecarriage if desired.

F. & W. "Champion" Disc Harrow

An Out-throw disc which has earned its great popularity because it has the design and the high grade materials to do splendid work, and remain a stranger to the repair shop. Each section controlled by its own lever. Splendid dust-proof bearings and adjustable scrapers keep the high quality discs turning easily at their work. Fitted with pole instead of forecarriage, or with double wheel forecarriage if desired.

Ask our nearest dealer to show you illustrations of the new Frost and Wood Combination Harrow. We have Farm Implements and Machines for every need. Catalogues gladly sent on request.

DAIRYING.

NOVA SCOTIA DAIRYMEN IN ANNUAL SESSION

(Sontinued from last issue.)

Following are the resolutions passed by the Association:

Whereas the Nova Scotia Dairymen's Association has had representatives on th eNational Dairy Council,

And where as we believe said Council can do a great deal of good in connection with dairy work,

Be it therefore resolved that we again appoint delegates to attend and that the association raise the necessary finances to become a member.

* * *

Resolved that each and every patron of cheese and butter factories in Nova Scotia be assessed the sum of twenty-five cents by their respective factories and that they thus automatically become members of the Nova Scotia Dairymen's Association with full access to all its rights and privileges.

* * *

Whereas we believe that a Dairy School in connection with the College at Truro, conducted similar to that at Guelph would strengthen and stimulate Dairying in the Maritime Provinces,

Therefore be it resolved that the Dairymen of Nova Scotia in convention assembled, endorse the steps taken by the Maritime Committee in this connection and urge the Creamerymen in the various centres of our Province to use their best efforts to bring the matter before our representatives in both houses of parliament that the financial support necessary to carry our project may be secured.

* * *

Whereas the improvement in the quality of the butter manufactured is essential to the development of our markets and,

Whereas the grading of butter would seem to be a wise and effective step towards such improvement, and,

Whereas it would be necessary to bring a large quantity of butter together in one place,

Therefore be it resolved that this Convention recommend the appointment of a committee to investigate the organization of a co-operative company for the handling, grading and selling upon grade of butter.

Mssrs. W. A. McKay Truro; R. T. Stewart, Scotsburn and J. D. McKenzie, Bridgewater, were appointed a committee to investigate the organization of such co-operative body.

* * *

Whereas the Dominion Educational Butter Scoring Contest conducted by the Dairy Division of the Department of Agriculture at Ottawa during the past year, has been the means of giving the Creamerymen of Nova Scotia an immense amount of valuable information relative to the quality of butter,

Be it therefore resolved that this Dairymen's Association here assembled express their appreciation to the Dairy Division at Ottawa for conducting the contest and to Mr. George H. Barr, who personally carried out the details of the work, and also that we would urge the Department to carry on this work again during the coming year, and tha ta copy of this resolution be mailed to the Hon. the Minister of Agriculture and the Dairy Commissioner, Mr. J. A. Ruddick, at Ottawa.

* * *

Whereas the future markets of Nova Scotia butter depends on a high quality of product,

And whereas such quality of product depends tô a large extent on the quality of the raw cream supplied the creamery,

And whereas the average butter kept under cold storage conditions and scored at this Convntion showed very poor keeping qualities,

Therefore be it resolved that this Convention of the Nova Scotia Dairymen's Association strongly recommend a uniform system of cream grading with a premium for first grade.

* * *

Whereas the judging of the butter at this exhibition was a work of considerable magnitude and was carefully and efficiently accomplished to the satisfaction of all,

Therefore be it resolved that this Association express its sincere appreciation of the work of the judges to Messrs, G. H. Barr and Harvey Mitchell.

* * *

This Association here assembled will learn with deep regret that Mr. Harvey Mitchell, who has been Maritime Representative of the Dairy Division at Ottawa for a long number of years, is to sever his connection with the Department on March 31st of this year.

Be it therefore resolved that we place on record our appreciation for the valuable efforts and work that Mr. Mitchell has done for Dairying in this Province during the many years he was connected with it. The Dairymen in Nova Scotia have always found his advice sound and practical, and it is with feelings of depets regret that we will part wih his valuable services, and we can assure him that if he can reconsider his resignation and remain in his present capacity that it will meet with the hearty approval of the members.

* * *

Whereas at the present time there is a growing demand for more information relative to the cost of milk, both for the knowledge of Milk Producers' Associations, who wish to set a fair price for milk based on the cost of production in Nova Scotia, and for the information of the general public Fair Price Commissions, etc.,

Therefore be it resolved that we, as the Dairymen's Association of Nova Scotia, do urge the Department of Agriculture through the Dairy Superintendent, to carry on a farm survey or investigation on a certain number of farms in different districts throughout, the province with the idea of determining the cost of production by the farmer.

* * *

Whereas for the past few years there has been a considerable complaint in regard to the rough way in which cream cans have been used when the empties are being unloaded,

And whereas with the extremely high cost of cans and equipment the loss sustained through this source alone is a very great detriment to the dairy industry,

Therefore be it resolved that the Dairymen's Association of Nova Scotia in Sonvention assembled strongly urge upon the Railway authorities that they instruct their employees to exercise more care in the handling of cream cans, and that a copy of this resolution be forwarded to the C. N. R. Divisional Superintendents at Truro, New Glasgow and Bridgewater and to the General Manager of the D. A. R. at Kentville.

* * *

Whereas there has been considerable discusion as regards the present way of carrying on the Summer Scoring Competition,

Be it resolved that we make a change in the system of selecting the butter for this competition and that the Inspector of Creameries or anyone duly appointed by him, be authorized to go into the home storage of all creameries competing in this contest and select any 56 lb. box he chooses, each month for 5 months and have it closed up and shipped to Halifax or any storage they might be using.

This matter was left in the hands of the executive committee with power to choose exhibits in any manner they deemed best to the promotion of the production of good butter.

* * *

Whereas the Dairymen's Association has been meeting in Truro since 1914 and has been getting very good results with the exception of possibly a little lack of enthusiasm, and believing that if the place of meeting were changed to some other town for a year or two it would renew the enthusiasm, also give the members an opportunity of visiting the other creameries and bringing the patrons and community of that creamery into closer relationship with the Association,

Be it therefore resolved, that the Dairymen's Association hold its next annual convention at Bridgewater.

Save $40 on Each Calf Raised

COST OF RAISING A CALF FROM BIRTH TO 6 MONTHS

ON MILK—
2100 lbs. of whole Milk at $3.10 per 100 lbs. - - - $65.10

Stocks carried at
Toronto, Regina and Seattle

Stromberg-Carlson Telephone Mfg. Co.
10 FRONT ST., EAST
TORONTO, CANADA

Whereas we learn that it is the purpose of Mr. R. B. McLennan to sever his connection with the Department as Dairy Instructor for the Province,

Therefore be it resolved that we as Creamerymen express our regrets at the step he is taking, as we found in him during the two years of his work as instrcutor a man well qualified to fill this important position, whose criticisms, because always clothed with such a degree of courtesy, were pleasing.

* * *

Whereas increased production of dairy products by the farmers of Nova Scotia is of the utmost importance tothe dairy business of this province,

Therefore be it resolved that this Association express its appreciation of the Herd Improvement work conducted by the Dairy Division of the Dominion Department of Agriculture and urge the continued efforts of the Department along that line.

* * *

Whereas in the years past the following have contributed so liberally to the success of the Exhibitions which have been held in connection with this Convention,

Therefore be it resolved that the thanks of the Dairymen's Association be forwarded to the Canadian Salt Co. Ltd., The DeLaval Company, Ltd., The J. B. Ford Co., C. Richardson & Co., and also the buter buyers Messrs. Smith & Proctor, R. B. Colwell, Nickerson & Co., of Halifax, Messrs Smith & Proctor and The Harris Abattoir Co., Sydney.

* * *

Whereas we have in the person of Mr. H. R. Brown, Supervisor of Cow Testing, a man of real worth and value to the Dairy Industry of our Province,

Therefore be it resolved that the Dairymen of Nova Scotia in Convention assembled, express their appreciation of his untiring efforts in this important branch of our work.—Efforts which are being acknowledged by our Dairy Chief, Mr. Barr—and urge on our Creamerymen to do all in their power to supplement his endeavors by urging the patrons to test their herds.

* * *

A resolution expressing regret at W. L. Brenton's inability to be present was carried unanimously as was another resolution expressing appreciation of Mr. H. R. Brown and his work in connection with herd improvement. The latter resolution expressed the unquailfied suport of the Creamerymen for Mr. Brown and his work.

THE WINTER DAIRY EXHIBITION

The Nova Scotia Dairymen's Butter Exhibition held concurrently with the Association's meetings brought out 96 exhibits which graded 5 specials, 28 No. 1's, 33 No. 2's and 30 off grades. Messrs Barr and Mitchell, of the Dairy Division, Ottawa, placed the awards. Seventeen creameries took part in this summer butter competition, each sending a 14 lb. box to the cold storage in Halifax as per rules of competition, when advised by telegram from the secretary monthly for the months of June, July, August, September and October. These boxes were reshipped to Truro and scored just previous to the convention and exhibition.

Make Money This Winter—Saw Wood

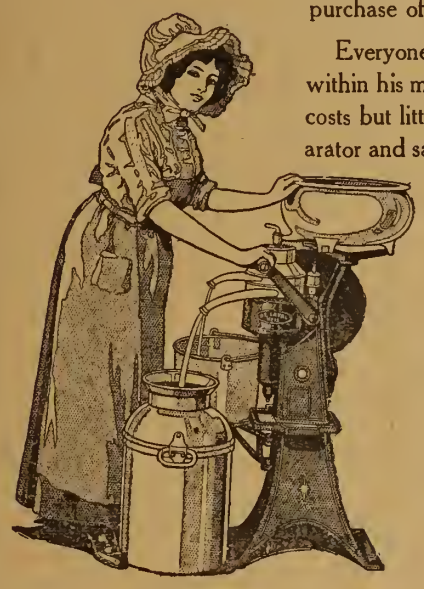
DE LAVAL
CREAM SEPARATORS
are the cheapest as well as the best



This is the unanswerable argument in favor of the purchase of a DE LAVAL Cream Separator

Everyone wants the best, provided its cost is within his means. Fortunately a DE LAVAL costs but little more than an inferior cream separator and saves that difference every few weeks.

Moreover, an inferior separator wastes in time and labor, and in quantity and quality of product what a DE LAVAL saves, and goes on doing so every time it is used, twice a day every day in the year.

If you doubt this is so, try a new DE LAVAL alongside any old machine you may be using or other make of separator you may have thought of buying. Every DE LAVAL agent will be glad to afford you the opportunity to do so.

If you don't know the nearest De Laval agent, simply address the nearest De Laval main office, as below

LIVE STOCK.

LIVE STOCK OPPORTUNITIES IN NOVA SCOTIA

(An Address by H. S. Arkell, Dominion Live Stock Commissioner at the recent Nova Scotia Farmers' Association

Gentlemen:—

I feel it a very great hoonr indeed to have been invited to this meeting of what is known in other parts of Canada as the Farmers' Parliament. I have never had the opportunity of looking into your faces before, and I feel that it is a great honor to have been invited here on this occasion.

I would like very much to suggest to Mr. Wickwire, that while he is improving the highway, that he try to improve the crossing from St. John to Digby. It would give a very better welcome to the visitors to this Province.

In speaking to you I can only give you the information I have obtained and I will try to put myself in the place which you occupy. I am perhaps at a disadvantage in not having had a chance to talk with you before the meeting and to listen to a discussion of this matter.

I am going to endeavor to lay certain things before you. In the first place, I think that one of the greatest problems in connection with stock raising has been the marketing of the stock.

I would like you to think with me on the problem of stock production in Canada, and the great task Canada has before her, in rebuilding her industry and producing an output for the world's market. How can you compete in this market? Few realize how great, at the present time, is the importance of live stock production in this country. Prior to the war the proportion of Agricultural exports of all descriptions amounted to something between 51 and 52 per cent of the total exports from the Dominion. Meaning that the Agricultural exports amounted to more than half of the exports from every source.

We are interested in the development of manufactuirng, in the development of mines, and various financial and commercial enterprises. Men realize that only by the development of the resources of the country through the farmers can the stability of our country be maintained.

There are other facts which I wish to bring before you. During the war, 45% to 48% of the total from all sources in Canada exported consisted of Agricultural products. This in face of the increased manufacture of munitions. The agricultural products reached the marvellous figures of almost half of the exports from the Dominion.

In 1916, the year ending Mar. 31, Canada's exports amounted to $113,000,000, in 1917 to $127,000,000, in 1918 to $198,000,000 and for the nine months in 1919-20 to $249,000,000. Animal products before the war amounted to 20 of the agricultural products, but for the nine months in 1919 amounted to 45%. Since the Armistice was signed there has been a steady decrease in export of manufactured goods. In studying the exchange has it occurred to you that European countries are steadily increasing their exports to North America while on this side we are obliged to restrict these exports, owing to the exchange situation, and while during the war the exports of agricultural exports amounted to from 45% to 48% of the total from all sources, for the nine months of 1919 the exports of agricultural products amounted to 58%. We have nearly reached the proportion of 60% of the export revenue to this country in the export of production from the farm. This is remarkable, something that it will be well for the whole country to consider, as having a bearing upon the re-establishment of our credit. A story which in the few figures which I have given you shows, if I am not mistaken, the policy which Canada must adopt in the financial situation in the years to come. I wanted to give you this to show how much stress we should put on the production of the farm, believing that it is upon this which our future prosperity will be established.

In view of the fact that we are likely to meet very serious conditions in wheat and grain, the one great outlook for the Canadian farmer is in the development of animal production for export, and in the last nine months 37% of the increase from all sources there was a decrease of $176,000,000 in munitions, $26,000 in chemicals and $21,000,000 in ores other than iron and steel.

On the other hand there has been an increase in the 9 months of $73,000,000 in agricultural products, $80,000,000 in animal products and $38,000,000 in wood, pulp and paper, and $12,000,000 in iron and steel. You will see the line along which our exports must develop, among which none stands higher than our animal products. I think I have never studied figures more convincing than these.

I want to say something in regard to our bacon. It may not be known that prior to the signing of peace, Canadian bacon on the British market was finding a place that was absolutely preeminent. In view of the absence of Danish bacon and the small quantity of Irish bacon, Great Britain has been obliged to turn to America for her supply of bacon, and Canada was placed side by side with America, and she was preeminent because she produced Wiltshire sides instead of the fat bacon produced by the United States.

The British market would take Canadian bacon at 20 shillings above the U. S. bacon per hundred.

Canadian packers were unable to fill the orders, and if we go into the trade as strongly and aggressively as Denmark did, we will have a place on the British market comparable with Denmark. If we are properly organized and go after this business we can build up such a trade as Denmark did when she was fighting for her national life, and I doubt if there is any country in the world that has such an opportunity for the sale of bacon as this country.

There was no product on the British market that was as short as dairy products, butter and cheese. Even with the recognized shortage of fat, and bacon, the one product demanded on the market and in the stores was butter and cheese, and it is a remarkable fact that Canadian cheese on the British market pretty nearly determined the price. New Zealand cheese could not be obtained during the war, and we are so much nearer that we have a good chance to place our cheese on the market at an attractive price.

The promise for dairy products is as good as ever. It is bound to be for the reason that there is a shortage of feed in Great Britain and in the European countries. When going to London first, one thing which strikes a stranger is the poor condition of the London horses. They had neither the oats nor the hay to properly feed their horses and for the same reason there is obliged to be a shortage in dairy productions. Holland and Denmark reduced production of bacon, Great Britain had reduced her dairy production and the shortage of crops in France, and non-production in the Balkans, and with the high price for wheat, the animal production in Europe will be delayed for some time, so that one must recognise the opportunity that Canada has for building up a market.

Sheep

I believe that Canada has a great future in building up a profitable sheep industry. It is not so much that we need to export our mutton. We have never yet developed a real market for our mutton in our own country and I am glad to say that the Minister of Agriculture is making an attempt to ensure a Canadian market for mutton which will make for a development of the sheep industry in this country, and after that policies will be developed to secure the protection for the home bred mutton as against the importation from other countries. I do not mean a fiscal protection, but I mean that a protection will distinguish between home bred and foreign articles.

Wool

Canadian people are demanding clothes made out of fine wool. It is suggested that this demand is in a

BETTER THAN NEW MILK

International Grofast Calf Meal supplies the young calf with all the elements necessary for quick growth—and keeps them sleek, thrifty and lusty.

Grofast Calf Meal will raise your calves just as well as new milk and at one-third of the cost. It is endorsed by successful farmers and breeders throughout the Dominion.

The Big Value in
FLOUR

OF all the products of the oven, there is none so important as a good loaf of bread. This test of "REGAL" has established its reputation as the big value in flour.

THE ST. LAWRENCE FLOUR MILLS CO.
Limited
MONTREAL

measure responsible for the high prices asked, and even if clothes were manufactured out of the coarse wool, and advertised at a lower price, they would not be sold. The only way clothes made out of coarser wool can be sold is to put a high price upon them, for people demand a $60.00 or $65.00 suit.

As regards the production of fine, medium or coarse wool, I believe that we should produce, not the fine wool or the soarse wool, but should aim for the medium wool, for which there is bound to be a consistent price, at steady, regular, consistent prices, that would be profitable for the Canadian farmer. Pudging from the whole situation in North America, I believe that the future bids well for a market for a high grade wool at a good price. which is likely to continue for some time.

Beef Cattle

If we are to be able to compete in the world's market we have greatly to increase the quality of our beef cattle. In reference to that I want to impress the requirements of quality in our stock. It is not only a question of breeding in our horses, our sheep, our pigs. We must absolutely insist upon the high class sire for we cannot afford to send or waste time and money in the production of mediocre stork. The Argentine, the U. S., Australia will take the preeminent places in the world markets if we allow them, and we are allowing them to do so at the present time. We should give most strenuous competition and we must do this on a business basis if we are going to achieve results which means that it ought to be a crime for a man to use anything but the best. In connection with selection there must be utmost care exercised. The business of the world turns aside from those who are behind the times. I believe that we are wasting our time through a lack of care in breeding, as well as wasting a great opportunity to make a success in the markets of the world.

Another thing I wish to impress upon you is that we do not feed our stock properly. I can go through this country from the Atlantic to the Pacific, and the majority of men are content to simply let their stock winter through, which means that in the spring the stock is lighter than it was in the fall by from 50 to 100 lbs., and it takes a great deal of time and feed to get them back into shape again. I say this to the farmers in all parts of Canada. In Western Canada I saw evidence of the same thing, and where are we going to land if we follow such practice as this?

It is right that we should talk about the pure bred sire, but the time has come when we must see that every moment from calfhood to the time when the animal is sold is used in putting on flesh. We must do this if we are to make a success of our business. Upon this will rest the result of our efforts.

Marketing

I am told that this is one of the greatest problems that confront you in this Province. I think it is one of the greatest problems of every country. We must develop in the minds of all farmers in Canada, an interest in market requirements if we are going to produce successfully. How many understand the situation at the Montreal and Toronto markets? How many know what takes place there? Unless you understand conditions and markets are obtainable you cannot procure the price for your products. I believe that you are having difficulty in disposing of your products satisfactorily, and that in the fall there is no market and a glut occurs. I believe that is one of the reasons you have asked me down here to discuss this problem of how you are to obtain prices that will justify your increased production. I am here to help you find that market for your stock, so that you will find it profitable to produce.

As you know, there has been a steady demand for the erection of a stock yard and abattoir in the Maritime Provinces. This demand has been continued during the past two or three years, and has reached its height during the past year. What are the Maritime Provinces to do unless stock yards and abattoir are established? I think that is the question that is turning in your minds. I have tried to study this question a little bit carefully. We have our officers going through the Maritime Provinces quietly in respect to this situation. The railway companies have been doing the same to determine the business opportunities. The packers have had their officers here to determine whether it will be profitable to place a stock yards and abattoir here.

They have come to this conclusion, as I understand it, that with the present business offered they do not see their way to provide either stock yards or abattoir. The business interests of this country have come to the conclusion that with the present business that offers it will not be to their financial advantage to build stock yards or an abattoir. That is exactly the fact as I understand it.

What then are the alternatives? One is to turn to the Government for support, meaning that the business interests actually engaged in trade cannot see their way clear to erect this accommodation, and that the Provincial or Federal Government shall supply these conveniences. I think you will readily see that the Government can offer the same excuse and may well hesitate.

If you will study the movement of live stock in this country, you will see that there are some very surprising things happening. First of all, animals are being purchased on the Edmonton market and are being moved from there to Toronto. You will recognize that the distance from Edmonton to Toronto is greater than the distance from Yarmouth to Montreal. Alberta cattle are moved to Chicago. If you compare the movement of live stock from Western Canada, and the movement of Maritime Province cattle to Montreal, you will see that they have to move their cattle a much greater distance.

I believe that in that lies the opportunity for solution of this problem. The Department went into this matter very carefully last fall, and there was co-operation between the Provincial officers, our officers and the farmers themselves, and since this co-operative idea was put into operation the price of lambs raised from 2 to 3c. By selling at Montreal the farmers obtained about 3c more for their products, and the haul did not militate against this procedure.

I spoke to representatives of the C. P. R. and the C. N. R., and they gave me assurance that they will cooperate in services. If the provincial and federal departments, the railways and the farmers get together on this to make co-operative shipments, I believe that it will afford a solution of the problem. I am told to say that the railways are ready to stand behind this proposition, and they will join us in making it a success. If we cannot make it a success, then we will have to review the situation another year, but I am satisfied that having gone into the situation very carefully, that for the moment the course is the right one, and I can pledge the Dominion Dept. is going into this matter with a view to solving the difficulties in the interests of the country.

I feel that it is the duty of the farmers to give immediate attention to the subject of production of animal products, as I believe that the future prosperity of the country rests along these lines. The increased manufactures and so called business interests aer important, but it is only by the greater production of agricultural and animal products that we can assure the solution of the problems that lie before us. I take this as the basis of my appeal to you, and I believe that every citizen should ask himself how he stands in relation to the future, and only in that way will we be worthy of the citizenship we possess.

If I am not mistaken, there is not a farmer here who cannot quietly make a living on his farm, and perhaps he will ask himself why he should take this added responsibility for the future? It is because we believe in this country, and we wish it to be the best it can be for our children and our future generations. We wish our citizenship to be of the very highest standard.

I do not believe we can lose sight of the duty we owe to those who are to come after us, and I believe we should face the problems which have been outlined. We have studied British history from an educational standpoint, and from a political standpoint. We have seen how wonderfully Great Britain has developed. We have studied her development of a wonderful colonization system, which now constitutes the great British Empire, but have we realized that this could not have been developed and built up without her great commercial system, and her industrial development which is the marvel of all people. It could never have been accomplished without the spinning Jenny and other inventions. It has been British industry and British ship building that has placed her at the forefront of the nations, and given her her place in history. And I believe that what is true of Britain is true of Canada, and it is only through the development of our resources that Canada can take her rightful place, and take her part in the British Empire.

THE HORSE

SAWDUST AS A LITTER

(Experimental Farms Note)

The amount and value of manure produced on the farm is in a measure dependent on the nature and supply of the litter used. For the purpose of a litter is not only to act as a bedding material, to keep the animal warm, dry and comfortable, but also to serve as an absorbent to take up and hold all the liquid excreta—the most valuable part of the manure.

Straw is the universal litter and there are few better, but there are seasons in which the supply is short and it may then be advantageously supplemented with sawdust. Indeed, used alone dry sawdust is quite satisfactory. It is clean and easily handled but is particularly valuable for its high absorbent power for liquids, which is two or there times that of ordinary straw, it is not rich in plant food constituents, but its subsequent decomposition in the soil gives rise to much humus-forming material. It should be used in sufficient quantity to absorb completely all the urine.

There is a more or less general impression among farmers that manure from stables and cowbarns in which sawdust has been used as a litter is injurious to the land. While we would not say that this suspicion may not have some foundation, we have never been able to discover a single instance of such injury and enquiry has been made both in Canada and the United States in this matter. Such injury could only occur on very light soils, following very heavy applications. Most satisfactory evidence has been obtained from many farms upon which sawdust has been used as a bedding material for a number of years, and upon which the soil is light and sandy. Naturally it is on heavy soils that this class of manure proves most effective.

One word of caution is necessary. Horse manure from stables using sawdust heats very rapidly, especially if left in the pile, and the excessive fermentation that may take place will seriously injure the manure. Such manure should be mixed with that from the cowbarn, which can readily be managed when manure carriers are installed and a manure spreader used. Mixed manure (horse and cow) may be handled in the same manner as that made with straw. The saturation of the sawdust with the liquid excreta promotes the ready decomposition of the litter under favourable conditions of temperature and the best place for this to take place, in order that the full manurial effect may be obtained, is in the soil. If the manure cannot be spread at once, the heap should be kept moist and compact, as in the case of manure made with straw.

The sawdust of hardwoods, decomposes more readily, and further is richer is potash and phosphoric acid than that of pines and conifers generally, but no harm due to resistance to decay need be feared from the use of the latter, provided that it is not employed in larger quantity than is sufficient to absorb and retain the liquid excreta.

Frank T. Shutt,
Dominion Chemist.

NEVER USE AS BREEDER STALLION OR MARE THAT SHOWS SIGNS OF HAVING CURBY-HOCKS

The excellence and value of a horse is freely stated as depending upon the quality of his feet, and the saying "no foot no horse" has thereby become a popular maxim. But the formation of the hock has just about as much to do with the stability, and motive power if the horse, and therefore value, as that of the foot. Undoubtedly, from its position and the work it has to perform, the hock is very materially connected with the value of a horse.

Formation of the Hock

The most powerful of the flexor or bending muscles are inserted into the point, of the hock, or the extremity of the oscalcis, as this bone is termed; and in proportion to the projection of the hock, or, in other words the length of this bone, will two purposes be effected. The line of direction will be more advantageous, for it will be nearer to a perpendicular; and the arm of the lever to which the power is applied will be lengthened, and mechanical advantage will be gained to an almost incredible extent. The difference between the power that can be exerted between a well-formed hock and a badly formed one, can be readily seen in comparing the method in which each is capable of assisting the horse to propel his body when hitched to a load. Suppose the hock bone (oscalcis) to be three inches in length, and that the muscles whose tendons are inserted into the point of the hock exert an energy equal to 4,000 lbs. Then further, suppose, that an inch is added to the point of the hock, which will be an addition of one-third to its length; a muscular power of less than 3,000 lbs. will now effect the same purpose. In other words a heavy muscular horse with a badly formed hock will not be of the same pulling power as a less bulky horse with a well formed hock. The slightest lengthening, therefore, of the point of the hock makes an exceedingly great difference in the muscular energy by which the joint is moved; and a difference that will tell in a long day's work. On this account, the depth of the hock, or the length of the bone, is a point of the greatest importance. It is received among the golden rules in judging the horse, that this bone cannot be too long.

A SAVINGS ACCOUNT

It is always well to have a Savings Account upon which interest is regularly paid and from which you are free to draw at any time should you have a good opportunity to buy stock or feed. A Savings Account is Ready Money. 78A

RESERVE FUND - - $15,000,000

Considering the situation and action of the hock, a swell as the stress thrown on to it, it is not to be wondered that it is liable to much injury from rapid or powerful action. The work which this joint has to perform, and the thoughtlessness and cruelty with which that work is often exacted, it need not come as a surprise if this necessarily complicated mechanism is sometimes deranged. Nine-tenths of the lameness that occur in the hind legs are to be traced to this joint, and when, after careful examination, one is unable to find any other seat of lameness, it is justified in affirming that the hock is affected.

The Capped Hock

A soft, fluctuating tumor sometimes appears on the point of the hock that gets the term "capped hock." It is seldom accompanied by lameness, yet it tends to lower the value of the horse. It is the enlargement of one of the mucous bags which surrounds the insertion of the tendons into the point of the hock. In the majority of cases it is produced either by kicking in harness or stall, or when a horse does not get sufficient litter to lie on when in the stable, and the hock is bruised when coming in contact with the hard floor. Capped hock may also result from a sprain, but it is more often the result of external violence. It is difficult to apply a bandage to take down the swelling, and puncturing or cutting the swelling is a dangerous practice, and should never be attempted. Blisters, repeated as long as necessary, are the proper means to be employed, and the preventative measures are to give the horse plenty of litter and have the wall behind him padded, so that his hock will not come in contact with a hard surface when the horse kicks out in the stall when alone, as some horses have the habit of doing. If neglected, it will assume a callous structure that will bid defiance to all means employed to cure it.

The Cow-Hock

When judging a horse, a good deal of judgment is exercised of the position of the hocks as the horse moves away from the judge. Some horses have their hocks closer together than others, and though hocks fairly close together are to be preferred to those wide apart, there is a closeness of hock that is not desired. Horses with this conformation are said to be cow-hocked, and generally they will be found on horses whose legs below the hock take a divergent line outwards. The leg should descend perpendicularly to the fetlock. The weight and stress are then equally diffused not only over the whole of the hock, but also the pasterns and feet.

The cow-hocked horse has his legs not only turned more outward, but they are bent more under him, and this increases the distance between the point of the hock and the muscle that controls it, thus increasing the tendency for thorough pin. The weight and the concussion when the horse is either standing or in action being so unequally distributed by this formation of the limbs, some part must be overstrained and overworked, and injury must ensue. On this account the cow-hocked horse is more subject than others to curbs, and that those hocks are many times termed by horsemen curbyhocks.

The Curby Hocks

Any sudden action of the limb, of more than usual violence may produce it. Young horses that are cow hocked are liable to get them in training for heavy work. Curbs are generally accompanied by considerable lameness at their first appearance, but the swelling is not always great. It sometimes presents so gradual a curve that it is scarcely perceivable when one is standing behind an animal so affected It is best detected by observing the leg sideways. At the first symptom of a curb, cold evaporating lotions should be frequently applied to the part. Equal portions of spirit of wine, water and vinegar, will be found an excellent application.

There are few complaints in which absolute and long continued rest is

more requisite than in curb. If the horse is soon put to work again, the lameness will frequently return. No horse that has had curb should be put even to ordinary work in less than a month after the apparent cure, and even then he should very gradually resume his former habits. It should be remembered also that curb is a hereditary complaint and therefore there may be some constitutional weakness of these parts. A horse with a curb is manifestly unsound.

The effect of cow hocks are seen further down the leg, there being a liability to spavin, thoroughpin, windgalls, sprain of the fetlock and knuckling. A slight inclination to this form of leg in a strong, powerful horse may not be altogether objectionable, but a horse or mare decidedly cow hocked should never be selected for breeders.

SALT IMPORTERS ST. JOHN, N. B.

WINTER CARE OF COLTS

With a view to ascertaining the actual cost of raising colts, records have been kept during the past four years of the amounts of feed consumed and of the gains made by the colts.

The brood mares on the Experimental Station at Scott, Sask., are grade Clydesdales, one weighing approximately 1,350 pounds, the other 1,550 pounds. The mares are worked until foaling time, and are then rested for two weeks. aLter they are used to do light work on the farm. The colts are kept in the barn when the mares are at work. When not at work the mares and colts run in the pasture and are fed a little grain in addition to the pasturage. The colts are weaned when about five months old.

Daily Ration

The daily rations for wealing colts have been about as follows:

Monring: One and one-quarter lbs. of oat chop, half pound of brain, four pounds of prairie hay.

Noon: One and one-quarter pounds of oat chop, half pound of brain, and three pounds of alfalfa hay.

Night: Half sheaf of oats, with oat straw.

On two night of the week, the oat sheaf is replaced with two pounds of boiled oats. Salt is given in the feed three times per week. The colts are watered three times daily.

Fed as indicated, the cost of feed for one colt for four and one-half months during the past winter amounted to $14.06.

During the period, the colt gained 115 pounds, and at one year old weighed 280 pounds. The colt a year older was fed twice the quantity of oat chop, and in addition one pound of alfalfa hay. The oat straw is also increased for the older colts.

Shelter

Colts up to two years of age are sheltered during the winter and only allowed out for an hour's exercise every day. This has been found to give larger colts than where they are allowed to run out in the open fields during the day and stabled at nights. As an illustration of this, one colt was allowed to run out in the day during the first, second and third winters. A full brother, of inferior conformation, was allowed out during the first winter but during the second winter was kept in the barn and given good feed. The latter colt weighed as much at two years as the first did at three years. Where protection is afforded, either by trees, hills, or a high-board fence, etc., the colts would no doubt do equally well outside, but on the open plains, without shelter of any kind, the cilts are chilled by the strong winds, if left out for too long a period, and do not make as satisfactory gains. In order to overcome this difficulty, light, roomy, box stalls should be provided in well-ventilated stables, giving the colts an opportunity to take some exercise inside, and this, when supplemented by an hour in the paddock. will keep them healthy and their limbs in good shape.

HORSES THAT HAVE TASTES IN CHOOSING THEIR HAY

That horses have their peculiar tastes in selectisg the most palatable feeds is shown by recent investigations at the Ohio Experiment Station, in which some hays were eaten with great relish while others were only partly consumed. Mixed clover and timothy seemed to satisfy their appetites best, and brome grass was also to their liking. Timothy hay stood third. None of the horses were fond of tall oat grass, while blue-grass and redtop were also near the bottom of the list of palatable grasses.

Attractive and sanitary buildings are a business asset to any farm; they suggest healthy live stock, protected seed that should grow, and machinery that is always ready for use.

Canada's Opportunity On the Highway of Success—What has that to do with GATES? Everything!
PEERLESS LONG SPAN GATES
The gate pictured below is a companion to the Peerless Perfection farm fencing, strong, durable, with heavy tubular brace, which stiffens it like a steel bridge. It swings true and rigid as an oak door hung by a master mechanic. Lateral and upright wires securely clasped at all intersections and stretched upon a strong rigid frame of tubular steel electrically welded into one solid piece.
For Looks, Wear and Service in appearance a Peerless Gate says: "I am guardian here." For durability it is of heavy open hearth steel wire, galvanized and can't rust at any point. For service it is put together to last a lifetime and is the cheapest best gate made. You will be interested in our Catalog. Write Today for Literature describing all our many styles of Gates, all kinds of Farm and Poultry Fencing for farm, ranch, residence, park, etc. It will pay you well to get acquainted with Peerless Perfection standard of construction. There are three chief needs for hogs to thrive: Fresh air, pure water and exercise.

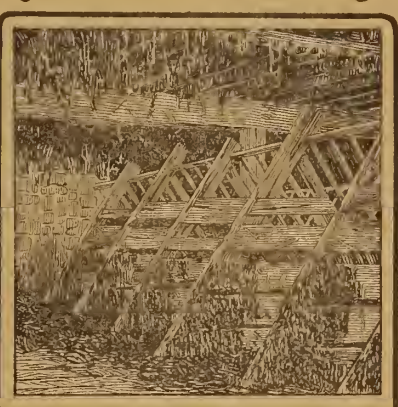
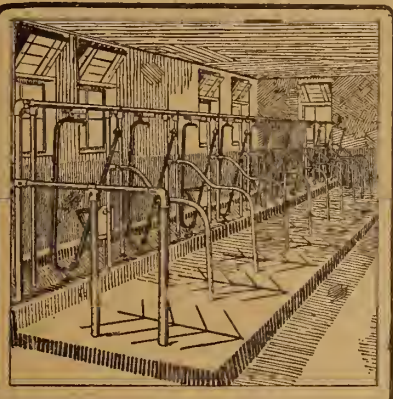
The difference in milk yield is due in large measure to a difference in breeding, but a herd of low production can be improved rapidly by the use of a pure-bred sire from a family of high producers.

1. With BT Steel Stalls you will have a barn that will save disease and keep your stock healthy. Disease germs and lice cannot live on the hard surface of the steel. There are no cracks, and nothing to absorb the liquid manure. BT Steel Stalls make your stable sanitary.



2. It is impossible to keep wood stalls and floors sanitary. Wood absorbs liquid manure. Cracks develop in the wood where disease germs and vermin breed. Wood partitions and posts obstruct light and ventilation. A dark, unsanitary stable breeds disease and prevents the stock from doing their best.



3. A clean sanitary stable will save you loss. It will save you veterinary bills, increase the milk flow from your dairy cows and keep your feeders and stockers healthy. The coupon below will bring the BT Barn Book which shows how BT Equipment saves disease and increases profits.

Send this coupon for the 352-page Barn Book. Tells how to plain and built the barn, how to ventilate, how to frame, how to save steps, labor, time and feed. This book saves you hundreds of dollars in building.

POULTRY.

ANNUAL MEETING OF THE NOVA SCOTIA POULTRY ASSOCIATION

The Annual Meeting of the Nova Scotia Poultry Association took place at the Agricultural College, Tuesday, January 13th, 1920, at 10 a. m. Mr. H. H. Hull, President of the Association, occupied the chair. Eighteen delegates from different poultry clubs of the Province attended. Minutes of the last Annual Meeting were read and approved.

A report was received from the Committee appointed to draft a Constitution and By-Laws but action was deferred to the afternoon program. The President read a letter from Dr. Barnes, President of the National Poulty Council of Canada in reference to the proposed trip of Edward Brown and the arranging of a series of meetings for this trip. Mr. John McMullen suggested that the best way to organize a meeting of benefit to the Poultry Industry would be to organize a Nova Scotia Conference and have the Department of Agriculture pay the delegates' expenses, 10 from each Poultry Club, to attend this conference. J. P. Landry suggested that as the National Poultry Conference was providing the money to pay the expenses of Mr. Brown it would be best for each club to arrange for the holding of a meeting open to the public in their respective districts. Mr. Fred Bath stated that it would likely be but one meeting and not much good would result except in the immediate vicinity of the place in which the meeting was held. It was further suggested that a conference of Poultry Breeders could be held at some central exhibition or fair. It was finally agreed on motion of Mr. W. W. Osborne and supported by Mr. Bath that the matter of replying to Dr. Barnes' letter be left in the hands of the newly elected delegate to the Poultry Conference at Ottawa and to the Secretary of this Association.

The President read a letter from the Secretary of the National Poultry Council re obtaining poultry for France and Belgium and asked the Poultry Association to take action in this matter. J. P. Landry sugested that young stock should be selected and if possible should be shipped in the fall of the year. Mr. John R. McMullen stated that only good poultry should be obtained for this shipment so that the quality of poultry kept by breeders in Nova Scotia would thus receive favorable advertisement. Mr. W. W. Osborne and Mr. Fred Bath were of the opinion that the selection should not be made from the whole of the flock of each one contributing any poultry to this shipment. It was further suggested that a more definite statement should be obtained as to the number of poultry required from Nova Scotia and the amount that would be paid for this poultry if selectd for shipment. It was finally moved by F. E. Jackson and supported by Capt. Borrett that the matter be left in the hands of the incoming President and Secretary.

Delegates

Mr. F. A. Driscoll reported that they had recently held a show of the Kings County Poultry Club which was highly successful. The weather had been very cold at the time of the show but some 18 exhibitors made a show of 160 exhibits.

Mr. John R. McMullen reported for the Colchester County Poultry Club. This Club has about fifty members and during the past year the members have raised more poultry and of better quality than in the past. A number of members of this Club have also entered pens in the Nova Scotia Egg Laying Contest. A show was held the latter part of November which was the best yet held by this Association. About 800 exhibits of high class poultry were in the coops at this show. The Experimental Station at Kentville, N. S., and the Live Stock Branch of the Department of Agriculture at Ottawa made exhibits at this show. A Poultry Plucking Contest was conducted and two bands were in attendance to enliven the visitors. The Daughters of the Empire, the Great War Veterans Association and several private firms purchased booths in which they displayed goods and articles for sale. This Association is making plans to hold a larger and better show next year.

Pictou County Poultry Association—Annual Report of President, 1919

The first year of the Association has just drawn to a close. In February last, when that small band of fanciers and enthusiasts met in Westville and brought the New Association into being, I do not think anyone would have had the temerity to forecast the greatness of the work that would be accomplished or the success that would be achieved within the space of one short year. That year has come and gone the Pictou County Poultry Association is firmly entrenched as one of the strongest and most progressiv Associations in the Province. It has staged its first show, and that a Maritime one, with an unqualified and unhoped for success, placing itself thereby in the very forefront of the Eastern Canadian Poultry Association. Early in 1919 while stimulating as great an interest as possible amongst its own members in the building and rearing of high grade birds, it took in hand the fostering of an interest in the school children of the various schools in the district and to this end Mr. J. P. Landry, Poultry Superintendent at the Agricultural College, Truro, was brought down to lecture to the children and the members supplied eggs for setting at a very reduced price, not more than one setting to each child, to those who would undertake to hatch the eggs and rear the chickens personally. A large number took advantage of this opportunity and the splendid exhibit of the school children at the exhibition held in November testified to the success of the venture.

The greatest accomplishment of the year, however, was the show staged in the Curlers' Rink, New Glasgow, on November 12th, 13th, 14th. The prospect was a very ambitious one, the show being thrown open to the Maritime Provinces and a major exhibition in every sense of the word was attempted. If a success of the

Royal Purple Stock and Poultry Specifics and Foods

In the manufacture of all our Stock and Poultry Condition Powders and Remedies we eliminate the cheap filler which is used by many manufacturers to make up a large package, and give you pure material which you can adulterate yourself if you wish. Mr. Farmer, how does this appeal to you?

Royal Purple Stock Specific

is a pure unadulterated condition powder, it is not a dope. It can be used throughout the entire feeding season and will not do your animals one iota of harm, works entirely on their digestive organs, causes them to assimulate the foods properly and digest every particle of food value. Fifty-five to sixty per cent. of food value is a fair average of what the animal takes out of its food without this condition powder: it makes their coats sleek and causes them to take on a healthy appearance in a very short time.

What We Claim For It.

Cows will give from three to five pounds more milk per day during the winter months. You can fatten pigs a month earlier, have larger and better pigs and save a month's time and feed. You can fatten horses ready for sale in four to six weeks. If you don't believe us try a 60c package on the worst animal you have on your place and be convinced. How many times have you said to yourself, "No matter how much I feed my animals they do not seem to thrive." This, Mr. Farmer, is because your animals are not in a healthy thriving condition. Royal Purple Stock Specific will compel them to put on a thrifty appearance in a short time and yet it will cost you less than 15c. per month per animal to use it. Put up in 60c. packages, $1.75 and $6.00 tins. If you have a lot of stock buy the large tin. It contains sixteen 60c. packages.

PURE-BRED STEER under 1 year, entered in Lot No. 3, Toronto Fat Stock Show, Union Stock Yards, Toronto, Ont., Dec. 11-12, 1919, and awarded 1st Prize. Also entered for Royal Purple Calf Meal Special, and awarded 1st Prize. Fed and Exhibited by Mr. Orll Williamson, R. R. No. 1, Jarvis, Ont. Sold for 33c. lb. by Auction. Weight, 1190 lbs.

Royal Purple Laying Meal

During the many years we have been making our high-class Stock and Poultry Specifics, we have had thousands of letters from Poultry raisers all over Canada, wanting to know what to feed their poultry. A hen is just like a factory. If you have lots of material in your factory, you can get out the finished product. The hen requires so much Protein, so much Fat, Ash Lime, etc., to make an egg and supply her bodily needs. Ordinary grains will give her a supply for herself and to make one egg every two to three days. For the accommodation of our customers, we have produced a Laying Meal which contains high-class meat meal, grains, etc., that will give her everything she requires for her bodily needs and produce an egg per day. If you cannot get this material from your dealer in your own town send us $5.00 for a hundred-pound bag and we will ship it to you direct. This product certainly fills a long felt requirement for the poultry man and simplifies the matter of feeding.

MANUFACTURED BY

W. A. Jenkins Mfg. Co., Limited

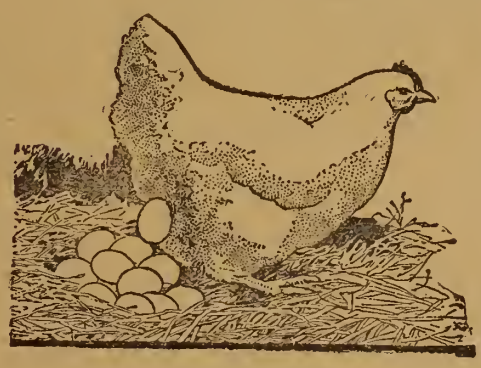
LONDON, ONTARIO

Royal Purple Calf Meal

There is probably no mixed feed on the Canadian market that the farmers have been buncoed more on than Calf Meal. You cannot make a substitute for milk with less than 10% Fat or over 20% Protein. Calves are entirely different from grown animals. You must supply them with material as much like milk as possible. In our Royal Purple Calf Meal we have a product on which you can raise calves after they are eight days old just as well as though you used new milk. At the Toronto Fat Stock Show this year there were eight calves shown not over a year old that averaged over one thousand pounds each, that were fed on this meal. If you will write us for our new booklet we will send you the full particulars and photographs of all these calves. Mr. Farmer, when you want calf meal you see that it contains over 10% Fat. Unscrupulous dealers and manufacturers are making meals that do not contain more than 7% fat and a large percentage of protein. Many of these meals are no better than ordinary dairy feeds. Fat costs two and a half to three times as much as protein in any market, but you must have it in calf meal to make a substitute for milk. Our Royal Purple Calf Meal is put up in 25, 50 and 100-lb. bags.

Royal Purple Poultry Specific

If your hens are not laying after the first of January it is because they are not housed properly and are in an unhealthy condition. There is no excuse for hens not laying if they are fed and housed properly. Our Royal Purple Poultry Specific, if used in the mash given them, will make them digest their food properly, make their digestive organs healthy and active and will produce the eggs for you as well in the winter as in the summer. The eggs are formed in batches from ten to fifteen, from the large egg down to the size of a pin head. If the hens are not healthy nature will lie dormant. As soon as our Poultry Specific is used nature becomes active. This is why so many people get eggs in a few days after using our Specific. If you do not get eggs it is your own fault. This Specific is put up in 30c and 60c packages. $1.75 and $6 tins.



Royal Purple Chick Food

made from all kiln dried white grains. You can raise 95 to 98% of your young chicks with this food, put up in packages and bags.

We also manufacture the following valuable brands:

Royal Purple Lice Killer in 30c and 60c. tins.
" " Cough Cure in 60c. tins.
" " Sweat Liminent in 60c bottles.
" " Disinfectant in 35c., 65c. and $1.40 tins.
" " Roup Cure in 30c. and 60c. tins.
" " Worm Powder in 30c. and 60c. tins.

Every article we make is guaranteed to do exactly as represented.

For Sale by reliable dealers everywhere. If you cannot get any of the above articles from your dealer write us direct.

FREE Write us and we will send you one of our new books that are now being published, giving you all the common diseases of stock and poultry, how to treat them, how to build a hen house, and wilderness of valuable information.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to houschold science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

"So many gods, so many creeds,
So many roads that wind and wind;
And yet the art of being kind
Is all this sad world needs."

TOO MUCH ELLA

The faster her daughter talked the more calmly Mrs. Doremus knit. She was more interested in "heeling" the khaki-colored sock than in anything Ella was saying.

"Mother!" Ella gripped her by both shoulders. "You must attend. How else shall I dare go away and leave you?"

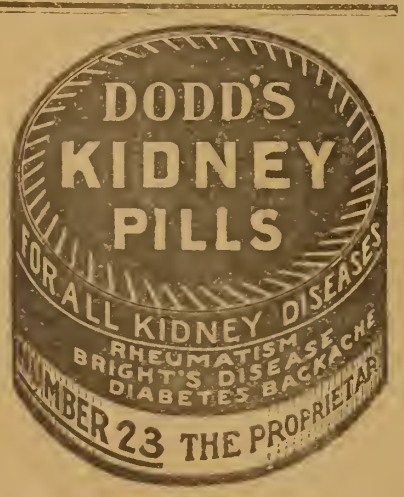
Mrs. Doremus lifted her large, mild eyes to the exasperating gaze piercing her. "Why, my dear, I've heard every word you've said. You began by saying that you and Leonard were going over to Hillville in the car this afternoon and that you would not be back before evening."

"Yes, and I've asked Carrie Randall to look after you while we're gone. She'll be in to get your supper for your. You can trust Carrie just as you would me, mother——"

"I've my doubts of that. I never did care much for Carrie Rankin. Anybody whose nose is put on her face, my dear, at such an angle that you can see her brains—what there are of them—Well, I don't want to be wicked, of course."

"I should hope not." Ella drew away flushed. "I've got confidence in Carrie Rankin and there's no one I feel I could more safely leave you with. I wouldn't leave you like this only Hillville is off the railroad and there's no way for me to see Emma Ransom before she goes away unless Leonard takes me in the car. Of course, that takes us both away from home, and I feel as though I was forsaking my duty. But still——" she paused sighing.

Old Mrs. Doremus was now flushed and the knitting needles jerked as she plied them, but she said nothing. For three years she had been hearing a great deal about Ella's "duty." "I'd love to go, but my duty keeps me at home," was the remark she had often heard Ella make. Once se had heard two neighbors talking about Ella. "Poor dear, she's so faithful to her duty," one said. "Well duty," said the other. Mrs. Doremus knew perfectly well that she was the duty. She hated the word and all it implied. It caged her like a bird and she never could bear to see things behind bars. She pretended not to see and tried to forget as far as she could. After all, she was only 79 and she felt almost young enough sometimes to skip rope or dance a jig.



Perhaps she could have one done or the other, too, if she had had proper meals. But the plain, hearty, old-fashioned foods she always had been accustomed to and loved, Ella would not have in her house. Ella was too fat and Leonard too lean, and so both had bad appetites. Between this modern Jack Spratt and his wife, poor old Mrs. Doremus fared badly. But it was useless to protest againt the food in another woman's house.

Yet old Mrs. Doremus always carried a well-filled purse that would have purchased for her endless luxuries. It burned her pocket many a day. To have money and the will and yet to have no privileges! Worst ol all, to be treated like a baby that was like to set the house afire if left alone in it a minute!

It was a long time since Ella and Leonard had both gone away and left, and they were not going to give her any liberty now.

"Carrie will be in promptly at five o'clock to get your supper, mother," Ella said as they started. "You'll have to be alone about an hour. Do be careful. Don't go near the cellar stairs. And if you feel bad or anything remember there's the telephone."

Then they were gone.

Old Mrs. Doremus sat down and drew three long breaths of relief. If she had felt a little stronger she would have danced a jig. So she merely sat still and tried to imagine herself free. The sensation lasted less than a minute, for the telephone bell rang.

It was Carrie Rankin. She had had a houseful of company come by motor and she could not possibly get away at five. If dear Mrs. Doremus did not mind waiting until a little later——

"That just suits me," old Mrs. Doremus said. "In fact, you need not come at all. I prefer you not to. I want to be alone." She hung up the receiver. "There! I guess I'm rid of her. Now what?" Her face suddenly brightened and she turned to the phone again. "Two, two, two," she said. "That you, Joe? I want Joe Gandy. Oh, why, Joe, I didn't recognize your voice! I know I haven't heard it lately. I know, Joe, what have you got in the line of eatables such as I used to order from you when I was housekeeping? Young onions, link sausage—yes—strawberries and full cream cheese—yes—new potatoes. Joe send me some of them all—a plenty of each, yes, plenty. And the bill, Joe. That's right. Oh, one minute, Joe. Whatever became of your Aunt Hannah Peck that I used to see when we all lived neighbors over on May street? She is? You don't say. Joe, I wish you'd send her over with the eatables. My land, I don't know when I've ever wanted to see anybody the way I do her. Yes, I will, I'll phone right over to your house and tell her so."

In two minutes more Mrs. Doremus had Joe Gandy's house and was talking to Hannah Peck. They talked until both realized that they were being denied the actual sight of each other by prolonging the conversation.

With so many groceries and other provender coming and company to prepare it for, Mrs. Doremus found herself more occupied and more interested than she had been for years. When the big basket was brought in and the different articles were set forth upon the kitchen table she viewed them with pride. Joe had sent her just the right quantity of each—you could trust Joe. She had traded with him for years before Ella took charge and sent all her orders to a more up-to-date grocery.

"That other package, Joe says he'll bring himself in the automobile," the boy said, grinning.

Mrs. Doremus laughed as she tied on her apron and went to work. By the time the "other package" arrived very nicely delivered by smiling Joe, she had the potatoes boiling, the onions cleaned and in a glass, bouquet fashion, right in the centre of the table.

"Well, well, Hannah Peck!" cried the hostess to her guest. They clung to each other and studied each other's countenances. Then with a sigh of gratification, they moved apart. "Well, set down, Hannah—right here in the kitchen if you will 'less you prefer to go in where it's cooler."

"Cool enough for me here," said Hannah Peck. "My, how good you smell! I guess you're getting up a feast, Nancy. And I know I shall enjoy it. You see, they've got me on a diet at home. Fanny, that's my daughteri-n-law, she's got an idea that my stummick's all out of sorts and I can't eat much solid victual. I tell her it's because she's got a delicate stummick that she thinks everybody else has. I just had to get loose some way so I came out here to Joe's a-visiting. But what do you think? Fanny wrote a letter telling Joe's wife to be very particular about what I eat—and you know how Louise is. She's conscientious to a T and after she'd given her word to Fanny that she'd look after me she wouldn't go back on her word for a farm. I'm glad to get out where I can do a little as I please. Can't I do something to help you, Nancy? I declare, I sit still so much that my hands fairly ache with emptiness."

"Why, yes, you can hull the strawerries," said Mrs. Doremus. "I did think I'd like to stir up a soft biscuit dough for a shortcake, but I was afraid my hand was out, I hain't made any in so long."

" Let me do it," Hannah said eagerly. "I can't no more than fail, can I?"

At six o'clock the old ladies sat down to a feast which they enjoyed to the utmost.

"Now, you know, Han," Mrs. Doremus said when they were filled to repletion, "I don't dare keep these left-overs in the house. Ella'd throw 'em all into the garbage can, and I never could bear to see good victuals wasted. I've a good will to send the whole kit and biling over to Mrs. Dunn. They're awful poor and she's got four children. You'll help me take 'em, Han?"

"Of course I will, and glad to, Nancy. Long as I had anything to give away I always gave it where it'd do the most good."

So the remains of the feast went to the delighted Dunns, who otherwise would have fared poorly for their supper. Then the old ladies washed the dishes and put the kitchen to rights.

"I expected Ella home before this," sail old Mrs. Doremus. "Long as she don't come let's go in and play a game of backgammon. What say, Han?"

But even after several games Ella and Leonard did not appear.

"Must be they're going to stay away all night," said Mrs. Peck.

"Like as not. Well, you can stay here just as well as over to Joe's, Han. I'll 'phone and tell Louise. But what in the world are we going to do for breakfast now we've given all our victuals away?"

"We can stir up some batter cakes and melt some sugar down into syrup," replied Mrs. Peck calmly.

The old ladies slept refreshingly and were quite ready for their batter

Can Eat Anything Now.

How Many Dyspeptics Can Say This?

The sufferer from dyspepsia and indigestion who has to pick and choose his food, is the most miserable of all mankind.

Even the little he does eat causes such torture, and is digested so imperfectly that it does him little good.

What dyspeptics need is not dieting or artificial digestants, but something that will put the stomach right so it will manufacture its own digestive ferments.

For over 40 years Burdock Blood Bitters has been restoring stomachs to a normal, healthy condition so that the food no longer causes distress, but is thoroughly digested and assimilated, and the dyspeptic can eat what he pleases without any suffering.

Mr. F. Dalton, Collingwood, Ont., writes:—"I was troubled with dyspepsia and was induced to try Burdock Blood Bitters. I took three bottles and am cured entirely; my stomach is free of all pain; I can eat anything I wish, and do not feel any bad effects."

B.B.B. is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

cakes when they awakened. Then Hannah with many farewells was carried away by her nephew.

Mrs. Doremus sat calmly knitting when Ella rushed in.

"Oh, mother!" she cried, distractedly. "We've had such a time! The car broke down in that terrible storm, and we had no chains, so we didn't dare move for two hours for fear of skidding; and after Leonard fixed it we only got as far as Airlie, and I couldn't 'phone, for all the wires were down, and——"

"Storm? What storm?" asked Mrs. Doremus in astonishment.

"Why, didn't you know? It came on about eight o'clock last evening. Look at the streets! They're strewn with branches. Where were you that you did not hear it?"

"I was playing back gammon with Hannah Peck," she remarked. "My land! I guess I must have been interested."

CUPS OF TEA

(Contributed)

First come those of washy, lukewarm beverage my mother considered good for young children, in those far distant days! especially those we had for breakfast after some childish illness, instead of the usual coffee. How I hated tea for breakfast; it made me feel so invalidish, and when I felt better, I didn't care for a convalescence, just wanted to jump out of one thing into the other.

The next that come to mind are those of the days I first went calling. There was one house in particular, a favorite; an invalid mother, three nice girls, and quite often, a charming nephew, who painted. The tea was good, and always hot, and every one had a different pattern cup and saucer with 'apostle' spoons. The second daughter used to 'pour out', and always took a spoonful from each cup and poured into the saucer before handing it to you. I don't know what the idea was, but it was never omitted.

Then I left home to train as a nurse. We dined at noon, the patients dinner coming after ours, then we nurses had a cup of tea. We each had our own pretty cup and saucer, mine was white, bearing the crest of Christ's College, Oxford, in colors. The Sister had a dainty tea-pot and we took it in turns to supply the tea.

Sister sat on the only chair in the ward kitchen, we 'pros' standing, leaving for the ward again as soon as our cups had been "read". The ward-maid generally read them, one, a deaf and dumb girl being in great demand.

I got rather good at it, and once while on night duty made a great hit with the night sister who came from Cornwall, and was most superstitious. It was Winter and a wild night. We had two meals during the night in our own ward kitchens. At 11 p. m. I told her there was an accident coming; a tall man in a cab, with a broken leg, and in about half an hour, sure enough he came!

At 4 a. m. I predicted another; a lot of men were with this one, and he was in an ambulance, and had hurt his foot. At 6 a. m. he came, in the railway ambulance and six men with him. He had crushed a foot while shunting in the goods yard.

Of course I was an oracle after that.

Then came marriage, shortly followed by disaster. Business failed, and my husband broken in health. The Vicar gave me the post of church caretaker for which I had a cottage. I was rather deaf so he insisted on my having a dog, his wife paying the license. It was a great mongrel but a good watchdog. One day, feeling more despondent than usual, I went to try to walk it off, taking the dog with me. As we walked over the common, I was counting my troubles instead of my blessings, the thought suddenly struck me, "We won't even be able to have a cup of tea!" I stood stupified till my attention was attracted to the dog, leaping and racing around without a care, and I couldn't feed ourselves yet alone a dog! Gradually the thought came, "She doesn't know, I don't know where to get her next meal from!" Then, "She trusts, why can't I?"

I turned for home and as I walked I prayed for faith. Next day, by the second delivery, the postman brought me a letter from my brother, containing a Postal Order for half a crown, and the assurance I could rely on it weekly through the winter. It bought tea, sugar, margarine and six quarts of skim milk, which I eked out to last seven days.

Ane day a man came to the door and asked me to make him a cup of tea. He was nicely dressed in Norfolk suit and looked like a gentleman on a walking tour. Ready to earn sixpence, I said I would. He had a chair on the porch, asked for the tea in a bowl two slices of bread and butter and asked for more sugar; when finished he bowed politely and said, "Thank you," and departed, never offering to pay. I was so astonished I couldn't speak till he reached the garden gate, then I only said, "Oh, it's alright," but I felt done.

A few years after we came to New Brunswick and found renewed health and fortune and have always managed to have a cup of tea. Indeed, I have gotten into the habit of a cup between meals and when I had to go to town, a drive of sixteen miles, I missed it badly till I came to know some people who live half way. They took me to their hearts and have been as father and mother to me ever since and I never call in but there is a cup of tea, though they didn't know of the habit at first. I said one day I was ashamed of the cups of tea! The dear old man said I was welcome "As long as I have a spoonful of tea and a stick to boil the water, and you must never go by!"

About two years ago a woman and her son, a boy of about sixteen, were tramping up the railroad track, and came to my house and asked for a cup of tea. I was out, but my daughter lit the fire and made her one. When she handed it to the tramp she flew into a rage, saying, "I can't drink that, it's too weak." So you see there are cups of tea and cups of tea.—Joanna M. Hudson.

NOT SOMETHING NEW — BUT SOMETHING GOOD

FOR almost fifty years Beaver Flour has been demonstrating to Canadian women that it is unrivalled as the best flour for general baking purposes.

The chief reason for this is that "Beaver" is a blended flour,—containing all the richness and goodness of the world-famed Ontario Winter Wheat combined with enough Western Hard Wheat to give it strength.

BEAVER FLOUR

enables any cook to produce bakings that are real food treats.

Bread made with Beaver Flour has that delicious, nut-like, homemade flavor so much sought after by all who appreciate good things to eat; while pies, cake and pastries are noted for their lightness, crisp flakiness and even texture.

Beaver Flour has earned its enviable reputation for superiority. If you are not using it now—try it! Sold by your grocer.

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. Dr. Chase's Ointment will relieve you at once and as certainly cure you. 60c. a box; all dealers, or Edmanson Bates & Co., Limited, Toronto. Sample box free if you mention this paper and enclose 2c. stamp to pay postage.

ABOUT BLANKETS

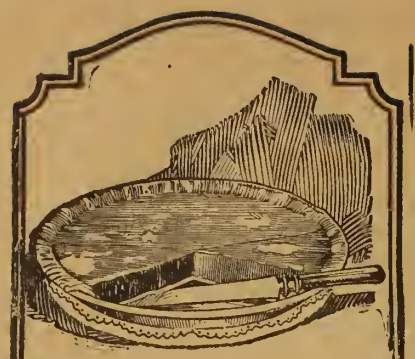
Wash woolen blankets in strong suds, not too hot, rubbing on as little soap as possible, rinse always in warm water, dry where they will not freeze, and they wil lnot shrink. Pull them into shape and fold neatly—do not iron.

Hang up woolen blankets lengthwise so that if the colors in the striped ends are inclined to run they will run down the stripe and not discolor the rest of the blanket.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send FREE to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Mrs. M. Summers
BOX 309 WINDSOR, Ontario



COOKERY COLUMN

COCOA PIE

4 tablespoons Cowan Cocoa
3 tablespoons cornstarch or ⅓ cup flour
1½ cups hot milk
1 tablespoon butter
2 eggs
¼ teaspoon salt
1 teaspoon vanilla

1. Heat milk.
2. Mix cornstarch, sugar, salt and cocoa.
3. Add gradually to hot milk.
4. Cook over hot water 45 minutes.
5. Beat egg yolks slightly, add and cook a few minutes longer.
6. Fill baked crust cover with meringue made of beaten whites and two tablespoons icing sugar.
7. Brown in oven.

WINTER HOUSE PLANTS

To one who appreciates flowers, there is no work more pleasing or gatrifying than the raising of them, and with a little experience very satisfying results can be admitted. For the winter house plants, varieties easily grown should be selected, and special attention given to the kind of treatment necessary, the soil, the amount of sun and water, and the temperature for each particular plant.

Plants which have large, strong roots will do beter in a loam containing less sand, while those with thin, hairy roots must have a fine, light soil. To obtain good loam, the following should be used: Rich earth from the garden or leaf mould from the woods. It may be necessary to heat it in the oven kill all animal life. Mix this with sand until the earth is crumbly. Fill a small pot with the mixture and wet it thoroughly. If the water runs right through and leaves the soil mealy and wet, it is in the proper condition, but if muddy and smooth, it needs a greater amount of sand. Mix more than is needed and keep it in reserve for the time when the plants require shifting into larger pots.

Always select pots in proportion to the size of the plant, as it is as weakening to the plant to have too much earth as too little young plants can be started in pots three or four inches in diameter.

To examine the roots, place the first and second fingers on each side of the plant, turn the pot upside down, give it a quick rap, then lift off the pot. If the soil is covered with a fine network of roots, place in another perfectly clean pot one or two sizes larger. Do not disturb the root ball. Simply put fresh soil under and around it, shaking the new earth into place rather than pressing it down. Water it well and protect from the sun for a few days.

When potting plants, it is most important to provide drainage. The best material to use for drainage is an old pot or bricks broken into pieces the size of pebbles. Put about an inch of this into four or five-inch pots, a little more in larger pots, over this put a thin layer of sod, then the soil prepared from loam and sand.

When watering, pour on enough to thoroughly saturate all the earth in the pot, or until a little runs out into until the earth begins to look dry. unil the earth begins to look dry. Keep the earth at the top of the pot loose, so that air may circulate. This is especially important with ferns and other plants which do not have sunlight, as the roots sometimes sour. Wash the leaves frequently with a soft sponge, as these are the plant's lungs. Change the air of the room every day, taking care to open a window. When the atmosphere is dry, keep a pan of water on the stove near the flower stand. Spraying the plants with a regular florists' sprayer is also helpful. Moist air is not only beneficial to the plants, but will keep away various insects which will multiply in a dry atmosphere.

In arranging plants about the house, place them in rooms where they will have as even temperature as possible, in the kitchen, dining or living rooms.

In the bedroom, where the windows would be open at night, plants might be frosted. Next assort them according to the sun they require. Roses, geraniums, carnation and nearly all flowers with rich coloring thrive best with southern or western exposures.

Fuchsias, begonias, marguerites and lilies will do well in windows facing east. Ferns and palms require no sun at all, and add much to the attractive appearance of a room. Occasionally turn the plants around so that they will not grow one-sided. If they grow straggling and send up only one tall stalk, cut the stalk back or pinch off the bud until the plant has acquired the desired bushy shape.

MEAT THAT IS DIFFERENT

Liver Loaf.—Slice and scald a pound and a half of calf's liver; drain and put through the food chopper; mix with this, three-quarters of a pound of chopped suet; add a cup of fine bread crumbs, one-half tablespoonful of salt, one-half tablespoonful of black pepper, a dash of cayenne, a teaspoonful of onion juice or finely minced raw onion; pack in a deep bread pan greased with soft butter, stand in a pan of hot water, cover closely and steam in a moderate oven for three hours. Can be served hot with a brown sauce.

Spanish Mutton.—One pound of mutton, two small carrots, one turnip, three-quarters of a pint of split peas, one large Spanish onion, three potatoes. Soak the peas for 18 hours, then put them into a casserole with the meat, cut into fairly small pieces. Slice the vegetables and add them to the casserole; cover well with cold water, season to taste, and bake in a hot oven for two hours.

Beef Loaf.—Mix together 3 lbs. of chopped raw beef, ¼lb. of minced salt pork, one cup of cracker dust, one-half teaspoonful each of salt and pepper, and moisten all with beaten eggs, and a teaspoonful of onion juice. Work in two tablespoonfuls of melted butter, and pack in a greased mold. Cover; set in a roasting pan of boiling water and cook in a steady oven for two hours. Let the loaf get cold in the mold before turning out.

Beef Hash, Russian Style.—Chop fine 2 lbs. of round steak, two small slices of onion and a sprig or two of parsley. Add half a cup of fine bread crumbs, half a cup of broth or beaten egg (both may be used), a teaspoonful and a half of salt and a dash of pepper. Mix thoroughly and shape in a loaf. Turn into an agate pan on which a slice of salt pork has been laid. Sprinkle the top with fine crumbs and bake about 40 minutes, basting four or five times with fat taken from the top of the soup kettle. Remove to a serving dish, put hot mashed potato well seasoned and beaten very light through pastry tube as a border for the meat. Brown the edges of the potato with beaten egg. Set the dish in oven over a dish of hot water and brown.

Braised Fish Tongue.—Boil tongue for an hour and leave it in the water for 15 minutes after taking it from the fire. Trim off the rough bits and fasten the root and tip of the tongue firmly together with a skewer. Put it into a covered roaster, placing it upon a bed of vegetables cut into dice of uniform size. The vegetables should consist of two carrots, two stalks of celery, one large tomato, a sliced onion and some minced parsley. Cover the tongue with diced vegetables, pour into the pan a cupful of the water in which it was boiled, cover the roaster and cook slowly for two hours. Lay the tongue on a heated dish and keep hot while you rub the pan gravy through a colander into a saucepan, adding the vegetables. Boil up at once, thicken slightly with

MAGIC BAKING POWDER
Contains no alum

The Bogey of many a game

TORN clothes are inevitable, yet they remain the bogey of many a childish summer game. Fear of the scolding that may follow the discovery of a ripped blouse, or skirt or trousers, helps turn many a youngster into a prim little old man or a finnicky little old woman.

OF course the good mother has plenty to do without the mending of unnecessary holes and the head of the family has sufficient demands on his income without having to buy unnecessary suits of play clothes.

BUT an excellent compromise may be made in this way: Ask at the Cottons counter for "PRUE COTTONS." For example, one of the *Prue* Cottons is *"Steel Clad Galatea"*—and it *is* steel-clad. On the other hand PRUE Cotton prints offer a great variety of light, clean, cheery long-wearing and washable materials at prices so low as to make a rip or two seem unimportant. If these are not what you wish there is a wide range of ducks or heavy plain cottons, all with the PRUE Cotton mark to guarantee their superiority.

"PRUE" stands for PRUDENCE

It is the seal of the prudent housewife's approval that has established Dominion Textile Cottons—*"Prue"* Cottons—as the best entering the Canadian household

DOMINION TEXTILE COMPANY LIMITED

MONTREAL TORONTO WINNIPEG

5

ittle browned flour, then season
ı a few drops of lemon juice, salt
pepper, as required.
leat Roll.—Two pints of ground
f, two pints of bread crumbs,
stened with one pint of milk, and
:e eggs, beaten together, one rounding teaspoonful of salt, one saltspoonful of pepper, two teaspoonfuls of butter, one tablespoonful of fine sage. The butter need not be used if there is sufficient fat in the meat. To make this meat roll nice the beef must be run through the grinder twice, removing the strings and bits of gristle carefully each time. Mix the meat then lightly with softened bread, and with a fork run the mass through to catch any possible remaining strings. Mold in two loaves in a pan and put in a hot oven 10 minutes to form a crust, then pour a little hot water in the pan. Bake one hour. Serve with white gravy. In this meat roll very cheap cuts of beef may be used, as the careful grinding makes it as good as choice meat.

MILBURN'S LAXA-LIVER PILLS

Keep the Bowels Regular and Prevent Constipation.

When the bowels cease to work properly all the organs of the body become deranged, therefore a free motion of the bowels every day should be the rule of every one who aspires to perfect health.

Keep the bowels regular and you will have no constipation, no bilious or sick headaches, no painful internal, bleeding or protruding piles, etc.

Milburn's Laxa-Liver Pills will regulate the bowels so that you will have a free and easy motion every day.

They do not gripe, weaken, or sicken, nor do they leave any bad after-effects.

Mrs. I. F. Boutilier, North West Cove, N.S., writes:—"I suffered with sick headache and constipation for over a year. I used Milburn's Laxa-Liver Pills and am completely cured now. I will recommend your medicine to all sufferers."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

WASTE IN THE KITCHEN

The influence of food upon the welfare of the household must be considered. A persons shelter may be poor, his clothing inadequate for his needs, but food he must have and upon proper food depends his capacity for doing work and doing it well.

The child must be properly nourished that it may be a strong little animal growing into healthy, happy youth. The adult must be well nourished to be an efficient member of the community. The food supply must be right, for errors and wrong doings here show their effects in a weakened power to perform work or ressist disease. In this lies the justification of the poor man who possibly spends two thirds of his income on food. Over nutrition is often as dangerous as under nutrition and the cost of food does not determine its nutritive value. It by no means follows that because a family has large butcher and grocer's bills it is therefore better nourished. The same causes affect the cost of foods as influence the price of other commodities. The demand for and the scarcity of any article; being in or out of season; cost of transportation; fancy price asked for certain rare flavors; all these determine prices outside of any consideration of nutritive value.

Bullock gives five ways in which he estimates that one-fifth of the money expended for food is actually

1.—Needlessly expensive material, providing little nutrition.

2.—A great deal thrown away.

3.—Bad preparation.

4.—Failure to select rightly, according to season.

5.—Badly constructed ovens.

In Mrs. Richards' book on the cost of living it is claimed that twenty-five or thirty cents per person a day is ample to supply all the physical needs of one whose tastes have not been perverted by wrong habits of eating. Good substantial living, meeting all the needs of people of simple habits, con be secured at less than that. When the expense exceeds that sum it is due to one or more of the following reasons:

1.—Waste.

2.—Buying out of season.

3.—Choice of food of which there is a limited supply therefore is high.

4.—Perishable food stuffs.

5.—Fads or fashions in dishes.

6.—High priced products because of choice flavors as "Gilt Edged Butter" or food which is "in season" but a short time as venison.

The housewife should carefully consider these estimates and the causes most fruitful of waste in the household. Far too lavish provision is often made in ordering. Study and observation must be given to the necessary quantity of meat, vegetables, etc., to be provided and served. Large portions are left to be improperly warmed over, wasted in the kitchen, or thrown away altogether. Waste in the household arises mainly from lack of thought, planning, or carefulness in detail, just as in any other business. A study of food and food value is necessary in order to know what less expensive material may be provided to supply the same need, but above all else must the housewife who desires to make a study of these things and reduce the waste in the household, realize that no waste is greater than poor material illy prepared. The more knowledge, the more science used in the selection and preparation of food for the table should mean more not less appetizing results.

Of course the price paid for food cannot be regulated entirely by a consideration of nutriment alone. It must satisfy aesthetic demands as well. Food must be enjoyed in order to be thoroughly well digested. This is a strong argument in favor of moderate use of animal foods. Although vastly more expensive then vegetable foods, they do not gratify the palate of most people in ways which vegetable foods do not. This fact together with their superiority in being more easily and completely digested are valid reasons for paying somewhat more for the sake of securing them.

Dry Groceries

There is a class in buying which much time and thought may be saved by supplying enough for a month at least in advance. This is dry groceries such as sugar, flour, cereals, flavorings, coffee (unroasted) tea, chocolate, spices, soap, starch and all like necessities.

A store closet large enough to allow the purchase of these things at a wholesale store, and so arranged as to temperature, dryness, light and ventilation as to keep them in perfect condition is a saving so great as to astonish one who tries the method for the first time. Often the difference amounts to twenty per cent.

Sugar should be bought by the hundred weight at least, flour by the barrel, caned goods by the dozen or better still by the case, cereals by the dozen packages after the fall supply is in, vanilla by the quart (at the drug store to secure better quality) baking powder by the five pound box from which smaller quantities are transferred as needed to the box in use, soap by the box so that it may have a chance to dry out thoroughly and so waste less readily, and son on through a long list. Anything that does not deterioate in storage can be bought to much greater advantage in quantity. In groceries it is better not to buy an inferior grade. Here the best is the cheapest and wisest, especially in these days of competition and fraud. It is well to know a good brand and insist on having it. It should be remembered that the customer who knows and is particular receives the best of goods and services.

The expert business man is an expert in judging the materials in which he deals; he is perfectly familiar with the range of prices and quick to take advantage of all favorable conditions. The household manager needs to be just as familiar with all the goods that relates to the home and their prices. One cent less on a ten cent article seems a trivial saving, yet it is ten per cent.—ten dollars in every hundred. It is fair to state that there will be a difference in money paid of from ten to twenty

The Best Washer You Ever Met!

End Your Suffering!

Each year thousands of people throughout Canada put an end to their sufferings by the prompt use of Gin Pills. It is estimated that in the Dominion alone one out of every fifteen people annually use and derive the greatest benefit from these wonderful pills.

Prepared with the greatest care and thought from a formula that was only achieved after profound study and patient experimenting.

Gin Pills FOR THE KIDNEYS

have done more to relieve pain and prevent serious Kidney and Bladder Troubles than perhaps any other preparation that can be obtained.

Mr. Frank Ide, a pullman conductor, suffered intensely from pains in the groins, sore back and very severely from gravel and sediment. After taking Gin Pills Mr. Ide wrote us. "The pain left me entirely. I have no trouble whatever in urinating and I feel as well as I ever did in my life. I recommend Gin Pills to everybody in any way troubled with kidneys or bladder."

Mrs. Percy, Halifax, N.S., after trying a sample sent for six boxes. She wrote—"Before I finished the third box I found myself for the first time in years free from pain—the pains did not return. I wish everyone who suffers from backache and kidney trouble would use Gin Pills. They are great,"

If you suffer with pains in the groins or back, Rheumatism, swollen ankles, stiff joints, gravel, constant headache and lassitude constipation and dizziness, take Gin Pills and nip the trouble in the bud.

Send for free sample or get a box from your druggist or dealer, 50c with money-back guarantee.

One becomes an expert only through experience, but experience is not gained simply by ordering goods, appearance must be noted carefully and results compared intelligently to acquire the trained eye and the trained judgment necessary to the successful household manager.

SOME LITTLE WAYS OF SAVING FUEL

Here are some studied out ways of preparing foons before consigning them to the stove that will aid materially in saving fuel. Take potatoes for instance. They will bake better and more quickly if a thin slice is cut off each end and the potato laid on a rack with a pan of water beneath. Large potatoes may be cut in half to bake. Again, if they are boiled a few minutes before putting them in the oven, that, too, will hasten the baking process. Vegetables to be fried or scalloped should be diced—it cuts the time of cooking down about half. So should apples for pies. Thin slices take longer to cook because they pack and leave little ais space. Cut potatoes that are to be mashed into three or four pieces, and do not use more water than is necessary in cooking anything, for it only takes that much longer to heat. If you render your own lard or suet, it will melt faster if it is first run through the food chopper. Cut biscuits quite thin and your soup meat in small pieces.

Use close fitting covers for utensils, and after boiling has once started lower, the blaze, if you are using a coal oil stove, but see that the lid is not lifted every little while for steam to escape. After a certain temperature has been reached it does not require much heat to retain it. And use the heat of th tea kettle to reheat foods or to keep them warm, and save lighting the oven for that purpose. Rolls, bread or cake may be warmed by placing them in a paper sack over the simmering tea kettle. Set the dish of food to be kept warm in a colander and place over the kettle or over another pan of hot, or imitate the thrifty cook and set all such foods in a large pan of hot water set back on the stove. The double boiler, also, will come in handy in this connection. Salt causes the temperature to rise quickly, so a spoonful or two in the outer vessel of the double boiler is another help. When foods are to be cooked in boiling salted water, put the salt in the water first and it will heat faster. A large thermos bottle will save much reheating of liquids that are to be used in the same day. Leftover soup from luncheon may be thus kept hot for dinner, and sufficient coffee, tea or cocoa may be made for two meals, the surplus being kept in the bottle.

MENDING RENTS IN DIFFERENT GARMENTS

A garment properly repaired is not to be slighted. The patch may be made as perfect almost, as artistic embroidery. Each article and material, however, demands its own special treatment. For instance: Fine hose or woven garments should be mended before the threads break. That is they should be "run," using fine silk, wool or cotton, as the case may be, taking each stitch with your needle through the woven stitch and going a little beyond the thin places. Darn these on the wrong side. The thread for mending should be about the same texture as the material, never coarser. Thread finer than the material is preferred.

A pulled rent is about the most difficult of all garment tears. If possible, place a piece of material with threads running the same way under it and baste it in place. Then darn it down neatly and flat with ravelings. The "three-cornered" tear also requires patience. These two kinds of injjuries should be attended to as soon as possible to avoid stretching. Do the work on the right side and, it might be well to add, do not trim the rough edges of the tear, but baste, then sew the deges down, working exactly with the weave of the goods.

When it becomes necessary to patch a garment, as is often the case with children's clothing, place the patch under the material as described; baste it on evenly, cut the edges of the garment and patch, turn them under and make a tiny "snip" at the corners; see that the pattern of the material matches, plaid for plaid, stripe for stripe or thread for thread in plain goods; hem it on the right side nand then on the wrong; make little stitches with fine cotton, remove the bastings carefully, cutting in small pieces, not just pulling them out hurriedly.

To mend fine embroidery, first reinforce it with sheer lawn, then work over it either buttonhole or plain stitch, as the case may be. For lace, an underlay of net, fine or coarse, according to the texture of the fabric to be mended, is best and most durable. It will be less in evidence when the work is done.

What Does Health Mean to You?

HAVE you ever waited to think out the answer to that question?

Or are you like the great majority, who only appreciate good health after it is lost?

Slowly, but certainly, we are getting round to the idea of preserving health so as to avoid serious disease.

The old way of waiting until you are seriously ill before sending for the doctor is all wrong.

We all know the old saying, "an ounce of prevention is worth a pound of cure," but we neglect to carry it out in actual practice.

If you are familiar with Dr. Chase's Receipt Book you know that "Dr. Chase's Plan of Health" is built up on this idea of preventing disease, and the same applies to his well-known medicines.

Take Dr. Chase's Nerve Food for example. This food cure has established a wonderful record as a cure for nervous prostration, nervous exhaustion, nervous headaches and indigestion, and all forms of nervous disorders. And yet above all it is recommended as a means of keeping the blood rich, the nervous system in good condition and thereby preventing serious nervous disorders.

To most of us our health is our working capital.

We cannot afford time or money for rest cure in a sanitarium or expensive trips down South. For this reason we must seek other means of keeping the health up to high water mark.

So long as the blood is kept rich and pure the nervous system is well nourished, and it is by this means that Dr. Chase's Nerve Food effects such splendid results in the building up of the system when there are signs of exhaustion.

When you cannot sleep and begin to feel tired and irritable it is time to call in the aid of Dr. Chase's Nerve Food. You may also find your appetite failing and your digestion slow, for as the nerves become exhausted every organ of the human body is bound to lag in its work.

Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Limited, Toronto. Every box of the genuine bears the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author.

Ginger Drops

They may be made as follows: One cupful of molasses, half a cupful of sugar, butter and cold water, each, two teaspoonfuls of soda, one of ginger and enough flour to make a stiff batter. Mix and drop on buttered tins, place a blanched almond in the center of each cake.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

Mrs. M. Summers, Box 309 Windsor, Ont.

HOUSEHOLD SCIENCE COURSE

A Short Course in Household Science will be held in the Agricultural School, Sussex, March 2-12, 1920. Classes in Cookery, Milinery and Nursing will be conducted each day by efficient instructors.

Prizes will be awarded in each class for the highest total of credit marks in practise and written tests. Further information re these prizes will be given at the Short Courses.

Applications may be made for all classes, but students are at liberty to make a choice of classe, specifying such choice in their application.

Do not lose this opportunity. **Apply at once** to the Supervisor of Women's Institutes, Fredericton, N. B. Applications will be accepted in the order received.

How to make a soup without meat stock is sometimes a problem. The pot of meat stock has been a familiar object on the pantryy shelf so long that it has become synonomous with soup, but there are many other ways of making soup.

Cream is a good basis for soups, also bran and bean broth. Bran broth is made with one pint wheat bran, to which add one pint boiling water. Let it stand on the back of the stove for an hour and simmer, but not boil; strain and use a generous amount of butter to give it richness. eBan stock is made by soaking white beans over night and boiling until done, mash and strain through a collander. Water in which vegetables are boiled may be used as soup stock. In white soups always use white pepper.

Still Doing Great Work For Women

WHAT MISS SIMPSON SAYS OF DODD'S KIDNEY PILLS

Before Taking Them She Could Not Walk—Now She Can Walk and Work, and She Gives All the Credit to Dodd's Kidney Pills.

Ville Marie, Que. Feby. 13th. (Special)—One more tribute to the great work Dodd's Kidney Pills are doing for the women of Canada comes from Miss Angele Simpson, well known and highly respected here.

"When I commenced to take Dodd's Kidney Pills," Miss Simpson states, "My heart bothered me so I could not walk.

"Now I can walk and work."

Miss Simpson is not entirely cured yet but so great are the benefits she has received from Dodd's Kidney Pills that she is firmly convinced they will effect a complete cure. She has been a sufferer for eighteen years and underwent four months' treatment in a hospital before trying Dodd's Kidney Pills.

Dodd's Kidney Pills are a Kidney remedy. They relieve the work of the heart by putting the kidneys in shape to strain all the impurities out of the blood. Pure blood carried to all parts of the body means new health all over the body.

NEW BRUNSWICK'S RECORD IN THE EGG-LAYING CONTEST

PLACE — Dominion Experimental Farm, Charlottetown, P. E. I.

DATE—November 1st, 1918, to September 30th, 1919, (11 months.)

PENS COMPETING—Twenty.

VARIETIES REPRESENTED—Barred Plymouth Rocks 5 pens, White Wyandottes 3 pens, Rhode Island Reds 3 pens, White Leghorns 8 pens, Anconas 1 pen.

This is perhaps the first time a poultry raiser or breeder in New Brunswick has participated in an annual Egg Laying Contest of one year or eleven months' duration, under government supervision and her pens made a most creditable record.

The following is the record of the different varieties in egg production:

Barred Rocks—Pens, 5; total eggs, 5866; average per bird, 146.6.

White Wyandottes—Pens, 3; total eggs, 3084; average per bird, 128.5.

Rhode Island Reds—Pens, 3; total eggs, 2544; average per bird, 106.0.

White Leghorns and Anconas—Pens, 9; total eggs, 9211; average per bird, 127.9.

Egg Production of Pens from each Province

New Brunswick—Pens, 3; total eggs, 3702; average per bird 154.2.

Ontario—Pens, 1; total eggs 1174; average per bird 146.7.

Quebec—Pens, 4; total eggs 4588; average per bird 143.3.

P. E. Island—Pens, 7; total eggs, 6871; average per bird, 122.7.

Nova Scotia—Pens, 5; total eggs, 4370; average per bird, 109.2.

The three New Brunswick pens finished the contest FIRST, THIRD and SIXTH places in point of number of eggs laid.

Owner of Pen—W. E. B. Tait, Dorchester, N. B.—Total eggs, 1347; profit over feed cost, $20.35.

Owner of Pen—A. T. Reed, Rollingdam Sta., N. B.—Total eggs 1238; profit over feed cost, $19.85.

Owner of Pen—Molly Neales, Hartland, N. B.—Total eggs, 1117; profit over feed cost. $16.47.

Average profit per bird over feed cost, $2.36.

The N ewBrunswick pens were all of the Barred Plymouth Rock variety. They were bred-to-lay stock, hatched from eggs imported by the Poultry Division, Department of Agriculture, Fredericton, for distribution to Boys' and Girls' Poultry Clubs, and for sale at cost price to poultry raisers generally. During the last two seasons approximately 50,000 eggs have been thus distributed.

The hen that lays is the hen that pays.

The creditable record in egg production made by New Brunswick in the Prince Edward egg laying contest last year is being repeated at the present contest in progress at the Dominion Experimental Farm, Nappan, N. S. The Island contest was composed of 20 pens of 8 birds each representing the five Eastern Provinces and continuing for 11 months from Nov. 1st, 1918 to Sept. 30th, 1919. The three New Brunswick pens, which were Barred Plymouth Rocks, had an average production of 154.2 eggs per ird. Ontario was the closest competitor with an average production of 146.7 eggs per bird, but Ontario had only one pen in competition. New Brunswick had a yield of 29.2 eggs per bird over the average of the other provinces. The three New Brunswick pens were composed entirely of birds hatched from eggs imported by the Poultry Division of the Department of Agriculture in the spring of 1918. The New Brunswick pens at the close of the contest were in first, third and sixth places.

Careful feed records showed each bird of the New Brunswick pens to consume $2.96 worth of feed in 11 months, lay a gross value in eggs of $5.32 yielding a net profit of $2.36 per bird over food cost.

Best-by-Test FERTILIZERS for every CROP and every SOIL

FARMS YIELD MORE IN CROPS AND MONEY when they are kept up to a high production standard by the regular use of good Fertilizers. BEST-BY-TEST FERTILIZERS are strong in fertilizing power and are up to full strength of analysis. If you want advice as to the kind of Fertilizer you need, write us about your crop and soil. We are headquarters for scientific users of Fertilizer in Eastern Canada. We pride ourselves on having every brand, make or chemical any farmer or dealer could ask for. Ask your dealer, or form a club of farmers and order in carload lots. Prices on request.

The Nova Scotia Contest

The present contest in Nova Scotia is composed of 20 pens of 10 birds each and the same provinces, except Prince Edward Island, are represented. New Brunswick's quota is 8 pens all Barred Plymouth Rocks except a pen of White Leghorns owned by R. A. Snowball, Chatham, N. B. The contest began Nov. 1st, 1919 and the reports for the eleventh week which ended Friday, Jan. 16th, shows New Brunswick's pens occupying the first four places as well as the seventh, eighth, tenth and fourteenth. The pen in fourteenth place gained four places in the last week. At present the average number of eggs per pen for the New Brunswick entries is 145.2 and for the other pens 62.8 or less than one-half as many.

The following shows the egg production per pen for each week, the New Brunswick pens and the others being represented in separate columns:

Nov. 7, '19....	1.8 eggs	.0 eggs
Nov. 14, '19....	4.2 eggs	.5 eggs
Nov. 21, '19....	5.8 eggs	1.3 eggs
Nov. 28, '19....	9.2 eggs	3.4 eggs
Dec. 5, '19....	13.1 eggs	4.9 eggs
Dec. 12, '19....	18.1 eggs	8.2 eggs
Dec. 19,' 19....	21.5 eggs	10.0 eggs
Dec. 26, '19....	16.3 eggs	11.3 eggs
Jan. 2, '20....	18.0 eggs	8.5 eggs
Jan. 9, '20....	17,2 eggs	5.5 eggs
Jan. 16, '20....	19.6 eggs	9.0 eggs

Immaturity of the birds accounts for the rather low production in the early weeks. It is evident that the New Brunswick pens are continually increasing their lead over the other pens.

The report for the last week shows seven of the New Brunswick pens in the first eight places as regards production for that week only. Fourth pen in the weeks production went to a Nova Scotia pen.

The leading individual bird is in the leading pen. These are owned by A. T. Reed, Rollingdam, Charlotte Co., N. B. This bird commenced laying the first day of the contest, has laid 60 eggs to Jan. 16th and in no week has laid less than 5 eggs. This pen has averaged over 25 eggs per bird to date. The same breeder won third place in the Prince Edward Island contest last year.

Six of the eight New Brunswick entries are of the stock imported by the Poultry Division of the Department of Agriculture in its program for the improvement of the poultry stock of the province. Between 20,000 and 25,000 eggs per year have been imported during the past two seasons. Though the production in the contest pens is not high the results are at least comparative. Several pens of the same stock in the province are giving much higher production.

New Brunswick's record in the two contests has won for her, assurance from the Experimental Farms Branch of the Dominion Department of Agriculture that a similar contest will be held in New Brunswick commencing Nov. 1st, of this year. Poultrymen interested in heavy laying stock should begin now to prepare for it.

High egg production is an inherited character. Seldom will a strain or flock produce heavily unless the art of breeding for high production is applied. Not all birds in a bred-to-lay strain will lay heavily but other things being equal, the average should be considerably higher than from those not so bred. High egg production and the standardization of our stocks are the two factors which will contribute most to the promotion of our poultry industry.

A POULTRY SELLING FAIR

Among the many live wires on the staff of the various departments of agriculture, local and federal, in Canada, one may justly mention the name of Mr. G. R. Wilson, Dominion Poultry Representative for New Brunswick.

Mr. Wilson has been in the Maritime Provinces for only a comparatively short time, yet his pleasing personality and strict attention to business has won for him the admiration of his associates and the good people of the North Shore who know his finer parts.

One of the most important functions staged recently by Mr. Wilson was the Port Elgin Poultry Selling Fair in the County of Westmorland. The object was not so much the matter of price to the farmers, although from their point of view that was rather acceptable, as to improve the conditions in which poultry is being put on the market. These poultry selling fairs have been carried on in Ontario for some time past, but it was a new departure in New Brunswick, where in many parts the custom has been to kill the fowl by cutting off the head, scald and draw the birds.

Previous to holding the fair, assisted by the Agricultural Representative for the county, Mr. J. H. King, another live wire, eight meetings and seven killing and dressing demonstrations were held to acquaint the people of the Port Elgin District with the proposition of a selling fair and showing how to bleed the fowl through the roof of the mouth, and the manner in which birds should be dressed for market.

The Agricultural Hall was secured, where there was ample table space to display lots of well-finished and well dressed birds, along side of poorly finished and poorly dressed birds. Everybody present had a chance to see the value of dressing and finishing. Prices automatically did the grading, the better lots ranging three or four cents a pound higher than inferior lots.

The manner in which the progressive farmers of the Parish of Botsford responded will be seen when we say that about 7500 pounds of turkeys, 4,000 pounds geese, 3600 pounds chicken, 800 pounds fowl and 500 pounds ducks, an aggregation of 16,400 pounds was disposed of at a value to the growers of approximately $7000.00.

It is interesting to note that the prevailing price per pound was 50 cents for turkeys, 40 cents for geese, 35 cents for chickens and 38 cents for ducks. Previous to the Fair, the best price offered for turkeys was 55 cents, drawn, head and feet ermoved, which is equivalent to about 45 cents undrawn and heads and feet on.

We trust that other sections of the Province, after seeing the success of the venture at Port Elgin, will get in touch with Mr. Wilson and organize to dispose of their surplus poultry next fall in a manner that will be a credit to the province.

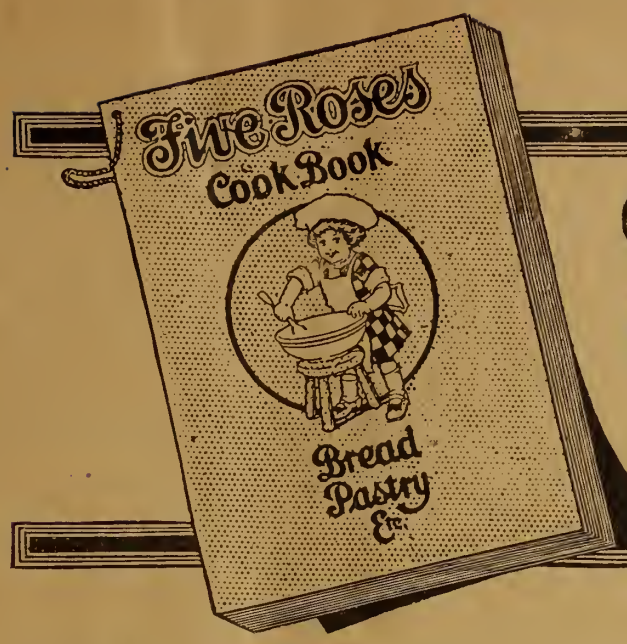
TOO MANY ROOSTERS

No more cocks should be retained than absolutely necessary for the spring matings. To have extra cocks running around the farm is as practical as having two or three extra bulls in the dairy herd. Keep as many as necessary and no more.

For Leghorns, one cock for every fifteen hens or pullets will be ample; for larger breeds, one to every ten hens or pullets. Oftentimes one to every twenty hens will be sufficient where you have a particularly vigorous male line.

Cock birds should be retained for mating with the pullets and cockerels for the yearling hens. Only those cocks which have proved themselves good breeders the previous season should be kept. Then gather up all the others and send them off to market.

The cocks had best not be permitted to run with the hens except during the breeding season. You can keep them without trouble if you will put the cockerels in a small pen with one old cock bird. The old fellow will keep order and they will get along nicely together. C. S.



Over a Million Canadians Enjoy These Recipes

THIS book is a source of baking-inspiration to over 300,000 ambitious housewives, and helps them to prepare delightful things for their 1,500,000 family folks.

The Cream of 20,000 Receipes to Help You

¶ We obtained the favourite recipes of more than 2,000 successful Canadian home bakers, added to them the best suggestions we could find in our vast experience and turned them over to critical examination and actual test.

¶ Our cooking experts studied them. For months they baked, boiled, stewed and fried breads, cakes, puddings, pies, doughnuts, pancakes, muffins, biscuits, etc., and they approved only the very best recipes out of the thousands submitted.

¶ The result is a 144-page book that offers a liberal education in the art of good cooking. It is printed in large, easy-to-read type, is illustrated with many pictures, and is securely bound to resist long wear in the kitchen.

¶ Six editions have been printed. More than 300,000 women have written us for copies—most of them at the urgent suggestion of friends and neighbors.

Here's the Evaporator to Solve the Syrup and Sugar Problem

Thousands of grove owners do not work their groves for very little reason. Lots of them just can't make up their minds. Yet if we were to put a proper outfit in their grove and they saw it work so easily and the money there was in it—for one season—they would fight to prevent us taking the outfit away again, even if the cost were a good deal more. An unworked grove these days is like an untapped reservoir with thirsty people around. A big demand and no supply. Why not put a

GRIMM CHAMPION OUTFIT

in your grove. One of a right size to work your bush to full capacity. Then there will be no waste and every dollar extra means more production. We can fit out any grove from sap spout to Champion Evaporator. Get in touch with us right away.

ANNUAL MEETING OF THE NOVA SCOTIA POULTRY ASSOCIATION

(Continued from page 346)

venture could be made it was felt that the fancy and industry could be much better served than by holding an exhibition open to the county only. Only by energy and hard work, however, could we hope to carry such a prospect successfully through, particularly when it will be remembered that a few months before the Association had only come into being, that most of the members were altogether inexperienced in show matters, and that the treasury held but some twenty odd dollars. However, these conditions did not deter the Committee that was appointed to carry the prospect through. Each member threw his heart and soul into the work. The support of the public was solicited and it responded royally. No less than 56 cups were donated and some 50 other specials. The support of the breeders was not belied and some 1205 entries were received. Nothing more was lacking but the patronage of the public, when the show came off, and blessed with good weather, this was given in fullest measure. The whole venture became an unqualified success. The work of the committee, which had labored harmoniously and well, bore fruit almost beyond expectation. The public was given the greatest poultry exhibition ever staged in Pictou County and one of the best ever pulled off in Eastern Canada. Everything was run on the cleanest possible lines, and the exhibitors showed their appreciation in the many letters and eulogies received by the executive.

But we must not rest upon our oars. The success of 1919 is but an earnest of what that of 1920 can be. Gentlemen, this Association has a great future ahead of it. The splendid body of men who go to make up its membership, the central location of its operations, the splendid impression made on the breeders throughout the Provinces and the handling of our last show, the enthusiasm and keenness of the officers who are carrying on its work all contribute as factors to make for unbounded success. We have great things ahead of us. Let me make a strong plea for that unity, harmony and good-fellowship in succeeding years that we have had in 1919. It is only by these qualities that we can hope to succeed. Our meetings have never yet been marred by the voice of dissention or of petulence. Get together, keep together, work together, let us forget all our petty grievances and have but one aim—the working for the comon good of the Association, with an earnest and keen desire to make it second to none in Eastern Canada.

PERCY GORDON, Pres.
3rd January, 1920.

Guysboro County Poultry Club

The Chedabucto Poultry Club begs to report that fair progress has been made and that its membership is still increasing, but the President and directors would like to see a greater interest manifested in it by the farming community of the County, as we feel its benefits are not confined to the few who at present are members, but to the whole Community. We are pleased to report that Special Prizes have this year been offered and hope that a much deeper interest will be taken in the Club in the futurefi

The Egg Laying Contest now going on at Truro should open the eyes of the farmers to consider if 10, 20 or 30 per cent bore eggs can be produced by using trap nests and thus weeding out the poor layers. It would be to their interest to use them, thus enabling them to get rid of those which must be classed as poor egg producers and the Chedabucto Poultry Club would recommend that the Blue Prints of the trap nests be more freely distributed amongst the farmers or better if the Experimental Farm could get some firm to manufacture the parts ready to be put together at a reasonable cost for shipment as other necessaries for poultry breeding are manufactured.

Again, we believe that farmers in leaving everything connected with poultry raising to their wives are not as thoughtful of the benefits to be derived from this source as they should be. It must be borne in mind that whilst the heavier breeds may not be as good layers, still a good laying strain of the heavy breed may be secured by the trap nests, and that circulars setting forth the plan of feeding and preparing the young chicks for market should be distributed more freely. One question arises in our minds. Is midwinter the best time

Sec'y Chedabucto Poultry Club.

Halifax Poultry Club

Mr. President and Gentlemen:

During the past year, 1919, the Halifax Poultry and Pet Stock Association held regular monthly meetings at which the members discussed many subjects in regard to Poultry, and also arranged for demonstration in different up-to-date subjects.

Amongst the most satisfactory and most interesting meeting held was one at which Prof. Landry gave a lecture and demonstration in the art of caponizing.

At this meeting several of our members not only saw the operation performed but actually caponized a few birds themselves. The birds on which we performed the operation made exeellent progress and in no case was there a failure. More of this work will be done this year and we consider that the poultrymen of Halifax are greatly benefited by the knowledge they gained at this lecture, and it is due to the lecturer who explained his subject to us in a most thorough style. It might be added here that on any occasion that we are having a demonstration which we knew would interest any person, whether he or she were members of our association or not, we took the trouble to see that the meeting was made known to them and the public at large, through the Halifax papers, and incidentally we have enlarged our membership considerably in this way.

Towards the latter part of the year, one of our members published a paper called the "Halifax Poultry and Pet Stock Bulletin." In this paper he published the doings of our association, also seasonable articles on poultry keeping with insets from the pamphlets of the Dominion Department of Agriculture, which gave cuts of such things as Trap Nests, Poultry Houses, Egg Candling appliances and many other useful articles which the most extreme novice would have no difficulty in understanding.

Other features of this little paper were reports of the Halifax and New Glasgow shows, also acounts of the two Government Exhibitions which were held at Musquodoboit and Shubenacadie. The reports of the 1st Nova Scotia Egg Laying Contest were also published. It should be noted that this paper was distributed FREE to all people whom we knew kept poultry, the advertising being the only means of financial return, and it must be said to the credit of the publisher, that on one occasion, he published the paper at a loss to himself, in order to keep up the good work.

Our object in telling you all about the Halifax Poultry Bulletin is, that we believe that many people received information through this paper that they could not get elsewhere and we feel that the Bulletin has done much towards getting new poultry breeders around Halifax. It might be added here that the Bulletin was made the official organ of the Halifax Association, through which we publish the notices of our meetings and any other news of interest, which show what we are doing to help poultry breeding in Nova Scotia.

The last point on which we wish to speak is the Halifax show, which we consider second to none in the Maritime Provinces. At our last show we had one thousand eight hundred and one entries, which we feel sure cannot be beaten down this part of the country. There were over fifty silver cups up for competition and in addition to these many special prizes which would be worth about $3,000.00 in cash. The weather during our show was very bad indeed, Halifax having one of the worst storms in its history, but in spite of this we came out with a good balance on the right side. A new departure was made this year, in that we had a class for novices, which will be an annual event with us. This class more than justified itself, there being more than seventy entries. We feel sure that this is the way to get more people interested in poultry and it can be plainly seen that it brought out many whom we probably would not have seen otherwise.

The judges for our 1919 show were Prof. Landry, Dr. C. Bowes and Mr. L. G. Jarvis, of Ontario, who gave absolute satisfaction and we take this opportunity of expressing our appreciation of their services.

In conclusion we beg to state that in our opinion, we have had a very successful poultry year and we hope to repeat this year, and get more people in with us at this most interesting work. Wishing all our sister associations, the Government Farms and College a most successful and prosperous poultry year for 1920.

Believe us, fraternally your,
Eugene L. Cote, Asst. Sec'y.
Wm. Coates, President.
Representatives, Halifax Poultry and Pet Stock Association.

Mr. A. A. G. Stronach reported for Antigonish and stated that the show in this county has not been a financial success. From a utility point of view the poultrymen have had much success and have made much imporvement in their work.

Mr. Frank E. Jackson reported for North Sydney Poultrymen and stated that they had a keen interest in everything pertaining to the poultry industry. He had secured feed and stock for their members, at greatly reduced rates that assisted the industry. He had been invited by the St. Johns Poultry Club of Newfoundland to attend their exhibition held there. He wanted the Nova Scotia Poultrymen to know that the breeders of poultry in Newfoundland had good poultry and were also very best of exhibitors and splendid men to meet.

Mr. Hull reported that the war had played havoc with the membership of the Glace Bay Association. Last spring school work had been done which helped to bring a great many of the younger generation as members into their association. Owing to the lack of accommodation, a building not being found large enough to hold the show, they had decided to forego this show until a suitable building would be available. The rink was undergoing extensive repairs and it was hoped would be available for the next show. A large membership was secured by having a collector call upon members to renew their membership in their association. The town and county councillors have contributed funds and the association proposes to organize branch clubs in this district.

The afternoon session of the Poultry Association opened at 2.30 at the College. Mr. Hull presided as chairman. Mr. Shaffner, of the Annapolis County Poultry Club, was called upon for his report of his society. Mr. Shaffner said he had no prepared report

Healthy and Productive Cattle

There is just one solution to your problem of keeping the stock healthy and productive during the months they are in close quarters ---"Scientific, Balanced Rationing".

CANADIAN PIONEER STOCK FOODS

provide a perfectly balanced ration, produce larger yields of milk from cows, have high nutritive quality, increasing weight at a low feeding cost.

but would tell of the progress of their club. Although they had not been able to hold a Poultry Show this year they were trying to promote the breeding of better live stock, their progress having gone more along the lines of utility birds. He spoke of their buildings for holding poultry shows and also of the room they held their meetings in which was very pleasant and spoke of many a pleasant evening spent there. He also spoke of their intention of holding a poultry show this year.

Mr. Hull then took up the Constitution and By-Laws clause by clause. It was moved and seconded that 1st, 2nd, 3rd and 4th clauses be passed as read. Mr. Bath made a motion that in clause 5 the following be inserted: "That delegates shall not exceed two from any one club." This motion was seconded by Mr. Jackson. Clauses 6, 7, 8, 9, 10, 11 to be passed as read. In clause 12 it was moved that "By virtue of their office President and Vice-President, Secretary-Treasurer should be members of each committee appointed. Clauses 13, 14, 15, 16 and 17 to be passed as read.

Meeting adjourned for one hour, which time was spent up at the Poultry Plant.

On their return to the college again new business was taken up. Mr. Hull brought up under new business the win on the piano at the Halifax Poultry Show. It was discussed and it was suggested that Mr. Johnson get in communication with the Halifax Poultry Club, and state his case. The Halifax Poultry Delegates were quite sure he would be treated fairly. Mr. Johnson was willing to do this. The following resolution was passed:

That the poultry entered and exhibited must in every case be owned and in the possession of the person exhibiting them for a period of 30 days before the opening of the poultry show.

If any person shall exhibit any poultry of which he is not the bona fide owner thirty days before the opening day of the show he shall forfeit any premiums won during the show and may be debarred from future shows for a period of two years.

In any case where the ownership of any exhibit is objected to by an exhibitor it shall be the duty of the owner of such exhibit in question to produce an affidavit made before a notary or Commissioner for taking oaths setting forth the facts relative to the ownership of the exhibits in question.

Resolved further: That this regulation be incorporated into the rules of every poultry club prize list which receives any aid from the Department of Agriculture of the Province of Nova Scotia. Failure to enforce this regulation will be sufficient reason to withhold grant to any show.

Secretary was to see that each Association received a copy of this resolution. It was moved and seconded that the Department of Agriculture be asked to furnish a poultry judge for Musquodoboit and Sydney until they should improve and make satisfactory arrangements for exhibits of Poultry at their exhibitions. Mr. Osborne brought up the question of spraying of coops after each Society was finished with them for their Show. It was moved and seconded that the new executive appointed to place the prize money to best advantage. It was moved by J. R. McMullen and seconded by W. W. Osborne that the Halifax Poultry Show be Official Provincial Show for this year and the department be asked to give $1,000.00 for this purpose. This motion was carried. An amendment was offered that bids be asked from the different poultry clubs of the Province. This amendment upon motion was not carried.

Election of Officers

The election of officers resulted as follows:

President—Mr. H. H. Hull, Glace Bay.

Vice-President—Mr. E. C. Griffin, Port Wililams.

Executive Committee—Mr. E. L. Cote, Halifax; Mr. W. W. Osborne, New Glasgow; Mr. F. E. Jackson, North Sydney; Mr. Fred Bath, Bridgetown; Mr. John R. McMullen, Truro.

Delegates to the Federal Poultry Conference—Mr. W. W. Osborne, New Glasgow; Mr. F. E. Jackson, Sydney.

Secretary-Treasurer—J. P. Landry, Truro.

The Executive, immediately after the close of the meeting, decided to meet at 7.30 in room 4, Stanley Hotel, Truro.

PATENT YOUR INVENTIONS

AN interesting and encouraging thing about these fortune producing inventions is that most of them are of ordinary or minor value in themselves. If you have a notion that you must invent a big thing to make money, get rid of it at once. Many of the Patents that have made their inventors millionaires are those which contained very few entirely new ideas.
The simplest ideas have earned fortunes for their patentees. The safety razor, the sanitary drinking cup, the hump hairpin, the demountable tire rim—any of these could have been invented by a man of average ability. In your every day life, at home, at your office, in your shop you handle any number of articles that are subject to improvement. If you can think of a way of improving some article or process already in use, or if you can invent a new useful device or process or article of manufacture, you are on the road to fortune. Dennison made a fortune from a single shipping-tag. Prepare now to meet the demands of Industry in All Fields for New Ideas and New Inventions. Before sending your invention to any attorney or manufacturer or disclosing your invention, write for our free blank form PROOF OF CONCEPTION in order to protect your invention and secure your rights.

WE ADVERTISE our Clients Inventions Free in INDUSTRIAL CANADA, which is the Official Magazine of the Canadian Manufacturers Association. It pays to have Shipman's Service. Ask for our new Booklet "Patent Protection"

Send Model, Sketch and description of any new inventions you have for Free Opinion as to Patentability. This Certificate of Patentability together with our blank form "Proof of Conception" will protect the Inventor and serve as proof of the invention until the case can be filed in The Patent Office. Do you realize every purchase of Fertilizers from the United States helps to depreciate still further the value of the Canadian Dollar?

The economic position demands that we reduce our purchases in the United States to a minimum. If we buy Acid Phosphate we are helping to depreciate still further the value of the Canadian Dollar. Most of this fertilizer is imported from the States, or in any case, where it is manufactured in Canada, the Rock Phosphate to produce same must come from the States. Sydney Basic Slag yields Phosphoric Acid which is entirely of Canadian origin. If you are in any doubt as to this proposition just consult your banker. Patriotism, therefore, demands that in these times we should use as few United States products as possible.

The Executive meeting was called to order at 7.30 p. m., Stanley Hotel, Truro, N. S., Mr. H. H. Hull, President, ocupying the chair and all members of the Executive present. After some discussion re the placing of prizes on contest pens it was finally decided on motion of Mr. E. L. Cote, seconded by John R. McMullen, that $50.00 be given to the hens laying the largest number of Canadian Standard marketable sized eggs during the period of the contest. These prizes to be divided as follows: 1st, $10.00; 2nd, $9.00; 3rd, $8.00; 4th, $7.00; 5th, $5.00; 6th, $4.00; 7th, $3.00; 8th, 2.00; 9th and 10th, 1.00 each. Included in the same motion it was decided to place $100.00 on the pens laying the largest number of Canadian Standard marketable sized eggs. These prizes to be awarded as follows: 1st, $20.00; 2nd, $18.00; 3rd, $16.00; 4th, $14.00; 5th, $11.00; 6th, $8.00; 7th, $5.00; 8th, $4.00; 9th, $3.00; 10th, $1.00. Some discussion took place in regard to the placing of the representation made at the convention before the department of agriculture, but no definite action was decided upon. Discussion also followed re obtaining arrangements for holding and managing the poultry show for the Province, but in this case the Executive decided not to make any recommendation.

Delegates present were as follows: F. E. Bath, Ed. Griffin, A. A. G. Stronach, F. E. Jackson, Chas. Johnson, F. A. Driscoll, John R. McMullen, Fred Barrs, Guysboro, Capt. Borrett, E. L. Cote, Alden Harris, E. C. Shaffner, F. Innis, H. H. Hull, W. W. Osborne, Elwood Gratto, Chas. McKeen.

J. P. LANDRY, Sec'y-Treas.

WINTER AND SPRING FEEDING

Keep your animals thriving so that they will lose no time picking up when put on pasture. The most economical way to accomplish this is to give them Herbageum twice daily. The cost for each horse, cow, beeve or hog is less than one cent a day, and the cost for three sheep or three calves or twenty fowl is less than one cent a day. To be exact only five-sixths of a cent a day, as one pound costing 25c is sufficient for a fowl for 20 days, that is five-sixths of a cent a day. If you cannot purchase it where you deal The Beaver Mfg. Co., Ltd., of Galt, Ont., will send to any Post Office in Canada a 4-lb. package by Registered Parcel Post for $1.40 or will deliver freight prepaid to your station 50 llbs. for $12.00 or 100 lbs. mor $23.00. Cash with order.

By its use you will be able to use more roughage and save expensive meals and grains at the same time keeping your animals in better condition. While the flesh, milk and butter produced will be in every respect better and the eggs return increased. As good calves can be raised on skim milk or separated milk with Herbageum as on whole new milk without it. And no "Sheep Dips" will be required as the sheep will be free from ticks and will produce stronger lambs, while at shearing time there will be more wool and of better quality. In over thirty years Herbageum has never failed, when used as directed, to do all that has been claimed for it.

With present prices of farm produce Herbageum would be profitable for regular use if it were $40.00 per 100 lbs. instead of $23.00. Use it regularly with all animals when not on a good pasture. It is not a food nor is it a medicine. It replaces values which are in good pasture but which are lacking in dry foods.

Make your own calf meal, as follows: 100 lbs. Oil Cake Meal, 100 lbs. Feed Flour, 200 lbs. Wheat Middlings, 4 lbs. Herbageum. Finesalt. Mix well. Stir about two cupfuls in a gallon of Scalding Water and feed warm. If you cannot get Oil Cake Meal use Ground Oats.—Advt.

Plough and Pen

THE farmer is making himself felt as a political force in the land. People are looking to him for the direction of public affairs, and no doubt he will wield the pen as well as he does the plough. In one, as in the other, he is adopting modern methods, as for instance,

Waterman's Ideal Fountain Pen

With a fuller realization of his position in the world of today, the food producer needs the services of the best pen. He writes letters, orders, receipts, and instructions. He signs papers, makes notes, writes cheques. He keeps accounts and records.

There is often an inclination to neglect these things because of the inconveniences of the old-time pen and ink. The Waterman's Ideal Fountain Pen reverses this because it makes writing a pleasure.

Sold by good dealers everywhere.

From $2.50 up.

NEW YORK, BOSTON, CHICAGO, SAN FRANCISCO, LONDON, PARIS.

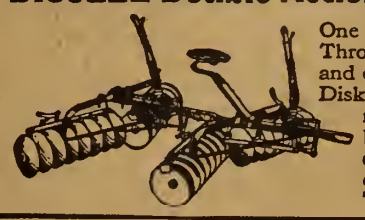
FLAX SEED FOR FREE DISTRIBUTION

This season, for the first time, samples of flax seed are being distributed free to farmers, from the Cereal Division of the Experimental Farm at Ottawa The samples contain about two pounds of seed, enough to sow about one-thirteenth of an acre. The quantity of fibre flax seed available this season is very small and enough requests have already been received to dispose of it all; but applications for samples of flax for the production of seed can be accepted for some little time yet though the number will necessarily be limited. These samples will be reserved chiefly for farmers in districts where the cultivation of flax for sed has been found profitable. The varieties available are ordinary commercial Premost, one of the most popular sorts in Western Canada, and a new selected type called Novelty which seem superior to Premost in productiveness but is not quite so attractive in appearance. These free samples furnish an opportnuity for the farmer to start the growing of a kind of flax superior to the ordinary stock usually sown. If carefully propagated the, second crop will yield enough seed to sow quite a large field. Good, pure flax seed is usually very hard to obtain, and the best plan is for each farmer to produce his own.

The variety of flax for fibre purposes which is being distributed is a new, selected strain named Longstem which has already made a name for itself as a singularly fine variety. Samples are not being sent this season to any new districts where the success of flax as a fibre plant is doubtful or where the industry of fibre production is not already established. It is expected that a much larger stock of Longstem will be available for distribution another year.—C. E. Saunders.

The time to select seed potatoes is before the crop is dug. The field may be gone over a few weeks before digding and the seed hills picked out. Those should be the hills having strong, vigorous vines, preferably with strong lateral side shoots. Stake these hills, and at digging time, dig them separately. If any hill does not come up to the expectation or the ideals set, discard it. A good hill should contain from 6 to 12 potatoes of good, medium size, say, from 10 to 16 ounces. Uniformity in size, smoothness and trueness to type are more important than mere size or weight. The selected tubers should be stored in the cellar separately from the rest of the crop, so as not to be mixed with the main crop. They should be used entirely for seed for the following year.

BISSELL Double Action Harrows will thoroughly cultivate and pulverize any soil. One Harrow is Out Throw; the other is In Throw. They are simply constructed, rigid and durable. The Gangs are flexible and the Disk Plates are so designed that they "hang" right into the soil. Bissell Harrows are built in sizes and weights suitable for horse or tractor use. Write Dept. M for free catalogue. 98



T. E. BISSELL CO., LTD., Elora, Ont.

THE TWENTY-FOURTH ANNUAL CONVENTION OF NOVA SCOTIA FARMERS ASSOCIATION

(Continued from page 335)

Resolutions

Whereas the rural school situation is yearly becoming more serious in this Province, resulting in an unincreasing number of school sections failing to keep schools open, and

Whereas we consider that education and successful farming today are inseparably connected, and

Whereas a very large proportion of our farming population never attend a higher school than the district school, and

Whereas the success of the rural school depends upon better teachers and larger salaries,

Therefore resolved that the N. S. F. A. urge upon our local government the necessity of pressing upon the Federal Government the claims of the people of this province to their share of the school lands of the Western provinces, a claim which is but just and fair, and

Further resolved that until such claim is paid the Local Government supplement the present grant to teachers according to grade by at least trebling the same.

Moved by R. L. McDonald, seconded by Wm. MceKnzie.

* * *

Whereas the Federal Government has refused to comply with the demands for a law prohibiting the manufacture, importation and sale of intoxicating liquors as strongly expressed in petitions and resolutions from temperance, religious and business organizations, and

Whereas at the last session of the Federal Parliament an act was passed relegating this vital question to the Provincial legislatures and to the people through the slow and unsatisfactory medium of a plebiscite,

Therefore resolved that the Nova Scotia Farmers' Association in annual meeting assembled, do strongly disapprove of this method of dealing with the liquor traffic and join with other organizations in calling upon our Federal Representatives to advocate and support the immediate enactment of a Federal prohibition law as the only practical way of dealing with this question, and

Further be it resolved that the Secretary of this Association be instructed to at once forward a copy of the above resolution to the Acting Premier of Canada and to all the members of the Dominion Parliament from Nova Scotia.

Moved by W. D. Creighton, seconded by D. F. Creelman.

* * *

Whereas it of National importance that the languishing production of beef and mutton in particular and all live stock products in general in the Province of Nova Scotia be promoted,

And whereas it is recognized that one of the most important means of promoting live stock production is the improvement of marketing facilities,

And whereas, the establishment of a capacious cold storage plant at the ocean terminals at Halifax would not only help to meet the situation but also take care of transcontinental export trade through a port that is accessible for twelve months every year,

Therefore resolved that th Nova Scotia Farmers' Association do urge upon the Honorable the Minister of Agriculture and the Honorable the Minister of Railways at Ottawa to take measures that will insure the early establishment of a modern storage plant at the ocean terminals at Halifax.

Moved by A. N. Griffins, seconded by V. B. Leonard.

* * *

Whereas we believe that the Public Utilities Commission is not adequately protecting the interests of the telephone subscribers throughout the Province by the exercise of the investigating powers conferred upon it by Statute, but is merely sitting as a judicial body at the hearings of the applications of the Telephone Company and basing their decision rendered solely upon the data submitted,

And whereas the Maritime Telegraph and Telephone Company have at all times in their employ officials whose duty it is to prepare and submit data favorable to and in support of whatever finding they require,

And further whereas the Telephone subscriber, the great body affected by the findings of the Commission, have no organization or advocate whose duty and business it is to prepare and submit data opposing the application of the Company and in support of the public interest and right, as a result of which, there is but one side of the question under review adequately and fully presented to the Commission, whose decision is rendered accordingly,

Therefore be it resolved that the N. S. Farmer's Asosciation in annual meeting assembled, do hereby agree to appoint and employ a suitable advocate whose business and duty it shall be to prepare and submit the case of the telephone subscribers, whenever any further increase in rates or other changes detrimental to the public interest is sought.

And further be it resolved that this meeting immediately appoint a committee to at once consider and recommend to this association, a person suitable for this appointment with recommendation as to the scope of his duties and the remuneration for such service.

Moved by Stanley Fisher, seconded by William Murray.

* * *

Whereas the value of Exhibitions as a means of encouraging the production of improved quality of all kinds of agricultural produce, including live stock, is universally recognized,

And whereas the Province of Nova Scotia has not conducted a Provincial Exhibition since the destruction of the Exhibition property in the Halifax explosion of 1917,

And whereas a movement is now on mott to establish an Old Home Summer and World's Exposition in the season of 1924,

Therefore resolved that the Nova Scotia Farmers' Association do recommend that these projects be taken up jointly with a view to providing some Exhibition facilities at Halifax at the earliest possible date and that the plant be gradually aded to until complete plant is ready for the 1924 Exposition.

Moved by Hugh Dickson, seconded by Stanley Logan.

* * *

Resolved that the resolution re the increase of grant for Agricultural Societies which was adopted last year be brought again to the notice of the

A COMPLETE LINE of
INVINCIBLE
MINER'S INVINCIBLE
INVINCIBLE
Formerly Called · MONARCH
BEFORE long you are going to buy a pair of rubber boots. Instead of asking for just rubber boots, ask for "Invincibles". We claim they are the longest wearing boot you can buy and we know you will say so once you have bought the first pair and know for yourself how long they wear. You will do just as tens of thousands of other men from coast to coast have done. You will take nothing else but "Invincibles" in future. Why? Because they wear so long you won't take a chance on any other boot.
"Invincibles" are Pressure Cured. It is the high Pressure Process that produces a solid one piece shoe and makes the rubber so tough that it doubles the wear.

Stanley Logan—Amherst.

Committee re Telephone Resolution

J Howe Cox—Cambridge.
Stanley Fraser—New Glasgow.
A N. Griffin—New Mines.

At a subsequent meeting of Directors C. R. B. Bryan was re-elected Secretary Treasurer.

Bridgewater, North Sydney, Digby and Yarmouth extended invitations to the Association in their respective towns in 1921.

The D. A. R. Industrial Representative Speaks

E. J. Murphy, Industrial and Colonization representative for the D. A. R. then addressed the meeting and told of his work.

The people of Great Britain and Belgium know very little of Nova Scotia through the agency of this office created by the D. A. R. Any wishing to retire or having farm lands for sale could acquaint him with the fact, and through real estate agents the information would be sent to Great Britain and imparted to the eager throngs that are always looking for a chance to immigrate to this great Dominion.

A small section on which they could start a little colony of perhaps four buildings the most advisable. He hopes for the co-operation of the Association in his work.

Sheep and Dog Law

Dr Cumming, by request, then explained the sheep and dog law. He said they had now in Nova Scotia very drastic legislation. Not only was it lawful to shoot the dog on sight when terrorizing the sheep in any way, but two years ago the law was amended and a tax of $1.00 on a male and $3.00 for a female was levied, also it included provision for an indemnity on all losses caused by dogs. This placed at two thirds of loss sustained. The municipalities appointing sheep valuers.

Also the law was amended to allow the shooting of the dog anytime within 24 hours after damage done.

This included the city dog too, the city to pay the indemnity.

Mr. Nicholson then vacated the chair and gave ewlcome to the new president, Mr. Howe Cox.

Mr Rhodenizer moved a vote of thanks to the retiring President.

Mr Nicholson thanked the Association, and the 24th Annual Convention of the Nova Scotia Farmers was brought to a close, after a very interesting and profitable session.

FARMERS OF NOVA SCOTIA ORGANIZED AT KENTVILLE

(Continued from page 337)

He believed they would have the majority on their side when they come to see the thing in the right light, and if all would throw away their party politics and affiliate the farmers movement would be a success.

If Nova Scotia dont' take a share of the responsibility they could not expect to share in the results.

Mr. Crane, Grand Pre, thought the Government and labor interests were awake, and that it was time that the farmers should "get a hustle on."

The question was then called for, and when the motion was put before the meeting it was carried almost unanimously, none at least voting against it.

Mr. Fisher, Berwick, said he was glad to see that the farmers were awake at last, and hoped they would now stand up for their rights.

Mr. Archibald was then called on as one who might give them practical suggestions on how to proceed with organization.

He said he had visited the West, Ontario and New Brunswick, where the farmers had already organized along these lines.

Many mistakes had been made, although not so many in New Brunswick as in Ontario.

He thought it would be well before going any further to get advice from Ontario, New Brunswick and Western Canada, so that these mistakes in this organization might be avoided. He was sure that representatives would be willing to come and meet with a committee and assist them in any way. He suggested that a delegate be sent from this meeting to the United Farmers Convention meeting in Woodstock, New Brunswick, the following week.

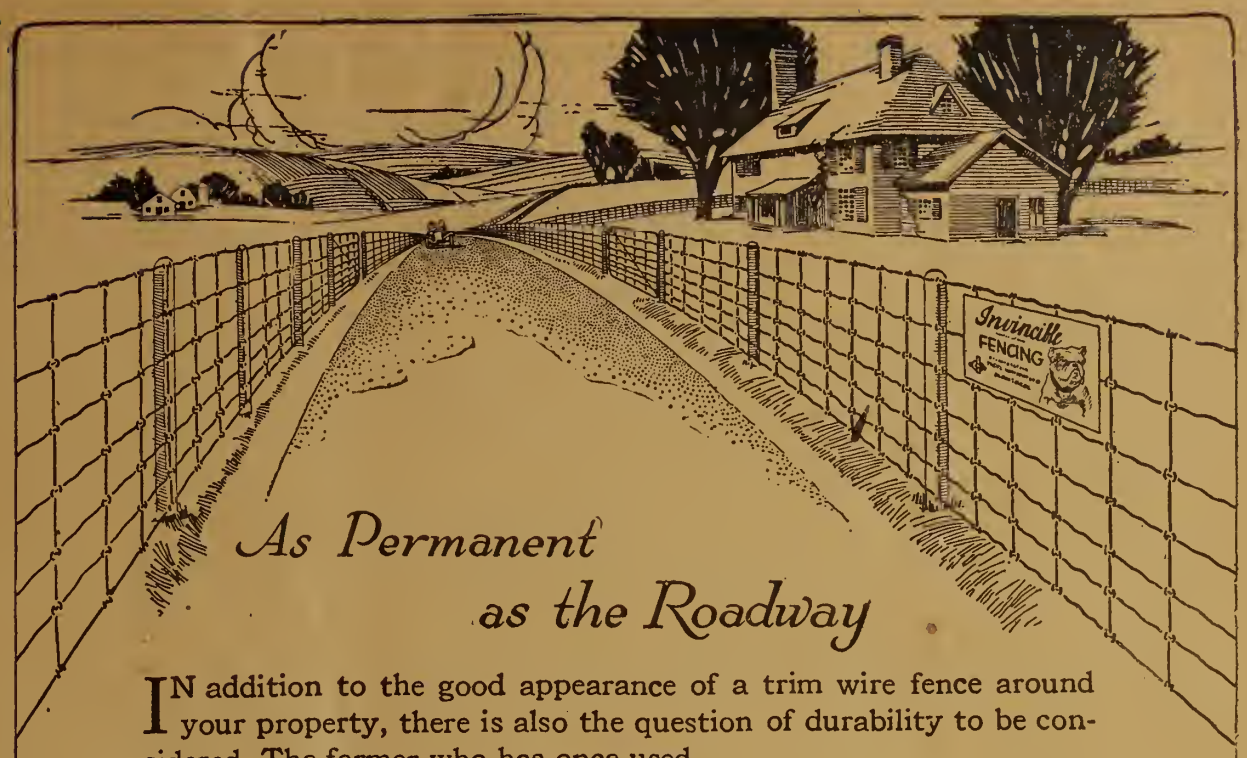
These suggestions were thought practicable by the meeting and Mr. Wm. O'Brien was appointed to be the delegate to Woodstock with Mr. M. K. Ells as alternative.

After the appointing of a committee of five, namely: Mr. Wm. O'Brien, M. K. Ells, D. R. Nicholson, Mr. Bacon and V. B. Leonard, to make arrangements for the coming of representatives from Ontario, New Brunswick and Western Canada to assist in the proper orgasization of this newly formed Union, the meeting adjourned.

Stumps occupy valuable land; foster the growth of weeds, since in order to keep the land in their vicinity clean, much hard labor is necessary; mar the appearance of otherwise smooth fields, and hence reduce the selling price of a farm; furnish shelter for harmful insects and animals; and prevent the efficient use of modern machinery.

It is well understodd by farmers, as by scientists, that a layer of loose dry soil, three or four inches deep, is effective in pheventing the drying out of soils. It stops the water from creeping upwards from the lower depths, thereby conserving moisture.

"It is not the low priced goods that are always the cheapest."



As Permanent as the Roadway

IN addition to the good appearance of a trim wire fence around your property, there is also the question of durability to be considered. The farmer who has once used

Invincible Fencing

will never use anything else, because once an "Invincible" Fence is erected, it's there for a lifetime.

Improve your property by erecting good serviceable Wire Fencing. It will pay you well to remove all the old rail fences on your farm and clean up the accumulation of shrubs, weeds and other pests.

You do not need to worry about your fences when you erect a woven wire fence on your farm. They do not need to be repaired after every windstorm, or rebuilt every Spring. Bad fences make bad neighbors.

WHEN YOU BUY WIRE FENCING, BE SURE THAT YOU INSIST UPON THE BEST QUALITY

Write for our Catalogue—Free—we'll mail it by return

Holstein Herd Averages 18812 lbs. Milk

A herd of 13 purebred Holsteins last year averaged 18812 lbs. milk and 638.57 lbs. fat.

Do you realize the money there is in such cows? It is estimated that the average annual yield of all cows in this country is under 4,000 lbs. These 13 cows produce as much milk as 62 cows of the 4,000-lb. class.

Why feed, milk and shelter any more cows than you need to produce the milk you require? If interested in

HOLSTEIN CATTLE

send for booklets—they contain much valuable information.

ANNUAL MEETING N. S. POULTRY ASSOCIATION

One of the most vigorous organization meetings at the Agricultural College, Truro, N. S., during this Farmers' month was the annual meeting of the N. S. Poultry Association. President H. H. Hull, of Glace Bay, occupied the chair and about twenty delegates were present from various points in the Province.

Very encouraging reports were received from a number of branches. One of the main elements in a successful branch, brought out again and again, was the necessity of a good show building. Various means were discussed for the dissemination of agriculture. Too often in the past the poultry flock had been lef to the already over-burdened housewife to care for. It was regarded as being somewhat beneath the plans of a full grown man to be interested in mere hens. That day has passed, and everyone who thinks the matter out knows that there is opportuinty here for the same high intelligence and patient industry which have made other branches of agriculture great and worthy avocations.

A communication was received through the national organization indicating that France and Belgium are in the market for good breeding stock. Altogether, the outlook for the poultry business is exceedingly bright.

You will never go back to Oil Lights after you have seen the advantages of the "F" Power & Light Plant

Agents Wanted
in every district to handle this biggest and easiest selling proposition and give owners the kind of service which has built the reputation of this Company.

TOUCH A BUTTON!—Instantly a flood of brilliant light in house, stables, cellar, garage, or barnyard. Better light—less cost. No lamps and lanterns to fill and clean. No groping in dark corners or unlighted stairs. Bright clear light, wherever you want it. Dependable, convenient, economical.

Power also at your command. Direct belted to your separator, churn, pump, grindstone, or washing machine, the "F" plant engine does as much work as an engine twice its horse power, producing current to drive these same machines by individual electric motors. The "F" Plant is a farm utility which gives you, dollar for dollar, more comfort, convenience and profit than any other farm improvement. It is a time-saver and a labor-saver.

Install an "F" Power and Light plant now and enjoy the advantages it makes possible. You will immediately benefit, and find greater pleasure and satisfaction in your home and on your farm.

Mail the coupon to our nearest office, to-day, and the "F" Plant catalogue will reach you in a few days, giving complete information.

The Car For All Roads

OVERLAND 4 is a carr for all seasons and all roads; attractive in appearance; economical in operation. It glides over the roughest roads with a smooth steadiness that is amazing.

This remarkable car has the two-fold economy advantages of **Triplex** Springs and light weight. **Triplex** Springs give Overland 4, with 100-inch wheelbase, the riding ease usually associated with great weight and long wheelbase. They take most of the shock and rebound out of road jolts. They lessen greatly the fatigue of long rides.

By protecting car and motor from the constant racking blows which mean wear, these springs greatly reduce up-keep expense. They make possible riding comfort with light weight; and Overland 4's light weight gives the further economy of low fuel and oil consumption and greater tire mileage.

Overland 4 is a quality car throughout —in design, finish and riding qualities. Equipped complete from Electric starting and lighting to three speed transmission.

It is completely manufactured for Canadians in a modern Canadian manufacturing establishment.

Cletrac
TANK-TYPE TRACTOR

Added Power — No Increase in Weight
Wider Tracks - Lighter Tread-Stronger Ground Grip

More kinds of Work
More days in the year

The Cletrac's Day is Here

THE tide has turned. The small tank-type tractor—for the Cletrac—that goes further than the simple job of plowing and takes the place of horses over plowed ground and seedbed, working faster and at lower cost.

The popularity of the Cletrac is not an accident. Engineers and army experts long ago saw the great advantage of the endless track as a device for turning motor power into draw-bar pull. The farming pu' lic waited only to see the same principle built into a ***serviceable*** small tractor and the Cletrac proved to be that tractor.

Farmers ***everywhere*** have now put their O.K. on the small tank-type and now the Cletrac is the fashion. 1920 will prove to any farmer anywhere that Cletrac farming is ***profitable*** farming.

The Cletrac, used alone or in "fleets," is the right size and type for almost any farm—the one tractor adapted to all conditions. It has proved its ability to stand up to its work. And now that the public has recognized its worth, it is out in front to stay.

The Cletrac now has more power, yet no added weight or increased friction to eat up power. Its track is one-third wider, which gives it a lighter tread and a stronger grip on the ground.

The Cletrac steering device, an exclusive feature, insures positive power to ***both*** tracks ***all*** the time. That means full power on the turns, as well as straightaway. A new water clarifier takes out all the dust that would grind your pistons and overheat your motor.

These and other features mean even better performance than before. Back of the Cletrac is the service of our distributors and dealers, with repair stocks near you and constantly increasing. Back of that is our purpose to make every Cletrac owner a booster.

You will be lining up on the side of progress if you start Cletrac farming now. You can't go wrong on it. A Cletrac means ***more kinds of work more days in the year,*** and lower cost on every job. Now is the time to start.

Send in the coupon, or see the Cletrac dealer at once.

The Cleveland Tractor Company of Canada Limited

Head Office:
WINDSOR, ONT.

Western Sales Branch:
REGINA, SASK.

Van Slyke Brothers say—

"During the past two seasons our operations have been very successful and satisfactory. Our first Cletrac, purchased in the spring of 1918, put in and took off 280 acres of grain, threshed it and hauled most of it to town. There wasn't a horse on the fields except to draw in the stooks. During the summer we broke 90 acres of brush land with it.

"We have had 9 years' tractor experience in this district and find the Cletrac more adaptable and more effiicient for the different jobs around the farm than any tractor we have used or seen at work."

Van Slyke Bros.,
R. A. Van Slyke,
Red Deer, Alta.

Happy Farmer TRACTOR

Simple and Dependable

THE Happy Farmer Tractor runs with little attention, except to see that the fuel and oil tanks are full. When you have a big job to do you will be grateful for its simplicity and dependability. It has only two-thirds the number of parts found on an ordinary tractor, and all the parts are in easy reach.

100% Reserve Strength

Every part of it is designed to take care of 100% more than the normal strain in case of emergency. When you need it the Happy Farmer can buckle down and develop much more power than its normal rating. You can count on it to be bigger than the job you give it. With its 12-24 horse power, it is the tractor that gives you maximum value for every dollar you invest.

Low Up-keep Cost

The Happy Farmer holds the official record for low fuel consumption per acre and for non-stop efficiency. You will find the slow speed two-cylinder motor the most perfect kerosene burning motor ever produced. It guarantees 24 horse power on the belt and 12 on the draw-bar. With such power the Happy Farmer can work hour after hour under a heavy load in the hottest and dustiest of weather. It does not heat—does not smoke—and because it has only two cylinders it burns kerosene more efficiently and requires less care and attention than a high speed four-cylinder type.

You will need a Happy Farmer Tractor more and more. See our dealer or write us.

Maritime Farmer Stand for East is Endorsed

Contention of this paper that Eastern Farmers Should act Independent of Winnipeg Strongly Supported

The Maritime Farmer is about to utter HERESY.

It believes that the farmers of the Maritime Provinces are being goldbricked with one of the most insideous campaigns that has ever been undertaken in Canada.

For years the Maritime Farmer has preached organization among the farmers in the Maritime Provinces. It has not only preached but it has practised.

There are in the Maritime Provinces thousands of farmers for whom the Maritime Farmer has saved thousands of dollars by putting in practise what it preached.

But the Maritime Farmer has in view a different kind of organization to that which is being presently attempted in the Maritimes.

It has in view an organization where freedom of speech will be permitted; an organization in which any man may be permitted to use the brains and the good common sense, with which Providence so generously endowed the people of Nova Scotia, New Brunswick and Prince Edward Island.

It did not have in mind an organization in which the farmers of these three provinces were to dance to tunes composed in Winnipeg, and to hop to strings manipulated by the same artists.

The United Farmers of New Brunswick is an organization which pins its faith to a political constitution laid down absolutely in the interests of Western farmers. In its preparation no voice from the East was heard. It is a dictum, as unalterable as the laws of the Medes and the Persians, except insofar as the strong majority in whose interests it was framed will permit of its amendment.

To become an associate in advancing the ideals of the United Farmers, one must absolutely accept the whole doctrine or none. There is no halfway. If you think differently you must nevertheless do as "the Romans do." If a United Farmer member of parliament choses to use his brains or to act in any other way, except as he may be directed, he is liable to a recall and told to go about his business and give way to more servile menials.

This is somewhat different to the methods of Maritime Province practise. We have had men who "DARED". May we have more of them. The Howes, Tuppers, Johnstons, Blairs, and their like, met big issues and dared to oppose. And may we preserve that tradition of ours, and fail again to be led like sheep by every demagogue that choses to prattle pretty promises, which up to the present have not been fulfilled in these parts.

The Maritime Farmer is a journal which believes in the east. It thinks rightly or wrongly that the interests of the east and west are not at all in keeping. Our farmers FARM. Most of the western farmers MINE. They not only want the earth, but they are reaching out for some of the planets.

Why the Big Stake?

Speaking at the United Farmers of New Brunswick convention at Woodstock, Mr. Pratt, of the Grain Growers' Guide, Winnipeg, was asked what would happen if the Maritime offshoot of the Grain Grower's Guide goes broke.

Mr. Pratt replied to the effect that "The paper would not be permitted to fail while there was a dollar behind the Grain Growers' Guide, as the management realized that the failure of the paper would mean the failure of the "FURTHERANCE OF THE OBJECTS OF THE GRAIN GROWERS OF THE WEST?"

MAY WE ASK WHAT ARE THE OBJECTS WHICH INDUCES A PLEDGE OF MILLIONS OF DOLLARS?

WHY ARE THE GRAIN GROWERS SO WILLING TO RISK HUNDREDS OF THOUSANDS OF DOLLARS IN "FURTHERANCE OF THE OBJECTS OF THE GRAIN GROWERS OF THE WEST?"

IT MUST BE A BIG GAME.

At present they are insisting that the government again buy their wheat at fancy prices and force the rest of Canada to pay the bill. We say no. Not only do we say "no" to that, but we again urge the farmers of these provinces to protest against any such use of the monies of this country, unless the farmers of the Maritime Provinces are accorded like treatment. The United Farmers of the west are going to Ottawa to force that unholy proposition on the government of the Dominion. Just so surely as they succeed, just so surely will every farmer continue to pay exhorbitant prices for his flour and feeds for the next year. The United States has decided to have no more price fixing.. Then why should we continue to pay an unheard of tax to the United Farmers of the West? The men who are doing this thing are the same men who are professing brotherly love for the farmers of the east, but who at the same time are making an attempt to rifle their victims' pockets as have pockets never been rifled before.

It is against such absolutely confiscatory methods that the Maritime Farmer protests. If wheat is to get special treatment, then let us have our potato growers looked after. Where is all the performance that was promised by the United Farmers in the marketing of potatoes? Has a single business-like effort been made to improve the condition of the farmers of the potato growing counties of this province? Has any person heard of any delegation being sent to Ottawa to urge the claims of the men who grow "spuds"? If there has been, it has been a very thin voice that has been raised in support of such a suggestion. Letters to the Maritime Farmer from up-river commend the course of this paper and claim that the United Farmers have been mighty short in fulfilling their pledges. They have stores which are owned by shareholders, the same as other stores. They are operated for profit, just as other stores are and they earn and pay dividends to their shareholders. And they pay these dlvidends to the shoreholders only. So far as the fellow on the outside is concerned he gets nothing.

Just contrast this with the policy of the Maritime Farmer. We assisted in co-operation. We help Agricultural Socities to get in touch with sources of supply which save money—not for the select few but for every farmer in the organization. More than that we have been buying for United Farmer organizations and there has been no profit asked on the goods, as in the case of the head office of the United Farmers at Woodstock, which charges every branch a profit on every purchase made. That Is to say a branch United Farmer store, must not only pay the wholesale price ruling at the time of purchase, but it must pay a second wholesale profit to the head office at Woodstock. And for rendering what service? For rendering the same service that the Maritime Farmer has been giving to scores of farm organizations in this province and in Nova Scotia without charging a single cent for that service. And yet we are asked to view the United Farmer organization as at present constituted—as something purely charitable and philanthropic.

Gentle reader, the Maritime Farmer sold car after car of feed and flour this year to farmers in the Maritime Provinces just one hundred dollars per car cheaper than the United Farmers sold the same commodities from their stores. Did you get it? We said one hundred dollars per car less?

It was because of its knowledge of these things that the Maritime Farmer refused the offer of Winnipeg to acquire this paper. The Maritime Farmer made up its mind that if there was to be a campaign of Big Promises, there would be at least one paper left with sufficient courage to say something about the hoax.

We believe that it is good for the farmers to organize, but we believe that the United Farmers of New Brunswick, or the United Farmers of Nova Scotia, or the United Farmers of Prince Edward Island should be the United Farmers of New Brunswick or the United Farmers of Nova Scotia or the United Farmers of Prince Edward Island. We do not believe that they should be that in name only, and be dictated to by Winnipeg and the West.

The recent meeting of the United Farmers at Woodstock was attended by about 200 delegates. Some 3000 farmers were expected. The program was one calculated to make farmers believe that there was nothing left on earth for the farmer except what Winnipeg in due course will supply. (Probably the increased price for flour and feeds will be the most notable contribution to this section). A resolution demanding a Canadian born Governor-General was widely debated. Yet when the question of forcing the Dominion government to provide abattoir facilities for the Maritime Provinces was brought up, Mr. A. E. Trites, of Salisbury, and Mr. C. F. Alward, of Havelock, two of the sanest men In this province, were given about three minutes in which to lay the important facts in their possession before the meeting. Yet only a few short months ago the United Farmers were very insistent upon the inauguration of a scheme which they dismissed in three minutes. The rest of the time was spent in lining up schemes in accord with the program adopted at Winnipeg.

The Nova Scotia delegates to the convention were given as warm a welcome as others. And let the Maritime Farmer say right here, that the United Farmer delegates could have heard more to their advantage and profit from Mr. Trites and Mr. Alward

(Continued on page 398)

SPRAYING AND DUSTING

By George E. Sanders, Dominion Entomological Laboratory, Annapolis Royal, N. S.

Mr. President and Gentlemen:

It is most certainly gratifying to find that your President and Council now ergard me as such a fixture in the apple industry (of Nova Scotia) as to put my name and subject on your programme without consulting me at all.

The apple crop of 1919 was very large and the general quality was very poor, as many of you realize. On account of changes due to frost damage to the trees, changes in freight rates, changes in transportation facilities, and the amount of money that the laborers now has to spend, enabling him to be a consumer of No. 1 instead of No. 3 apples, the apple trade this year has been radically different from ever before. Looking over the situation we must realize that the apple industry of the American Continent is now in a state of flux, and that within a very few years the permanent apples areas of the Continent will be determined. Many areas not well suited to the production of apples are now going behind in output and will eventually be eliminated as exporters, while other areas, among which is the Annapolis Valley, being well situated regarding soil, climate and markets, are going forward and taking their place.

Probably the one thing that has had the most serious effect on the apple crop of the past season is the fact that our old friend and consumer of No. 3 apples, the, so-called, poor down trodden laboring man, is no more. He is extinct. In his place we have a laborer whose income often exceeds that of Doctors, Lawyers, Members of Parliament, Judges or Bishops, and who exceeds all of the above mentioned classes in prodigal spending. The laboring men of a few years ago were gald to ge tNo. 3 apples, now they will only look at No. 1, and they are not at all particular about the price. They want only the best. This change is well shown in our apple returns this year. The market is willing to pay almost any price for No. 1 apples but thousands of barrels of No. 3's have been marketed at a loss. As growers we must adapt ourselves to this change in order to get best returns. We have two alternatives in the No. 3 business. One is to spray properly and make them No. 1's at a cost of twenty cents per barrel, or sell them to the canners and evaporators, at from two to four dollars less than could be obtained for No. 1's of the same varieties. On account of the wide spread between the prices of No. 1's and No. 3's I do not think that there is anyone here but who regrets having so many of the No. 3 grade. In most cases the preponderence of No. 3's is due to missing the first spray and that in turn was largely due to the spraying equipment having got into bad shape. Whether the neglect of the first spray and the poor quality of the crops was wholly or partially due to neglect the result is the same—a big loss financially to the grower.

The big argument in favor of spraying has always been improvement of quality and as the spread in prices between No. 1 and No. 3 becomes wider that argument grows in importance. This year the argument in favor of spraying based on improvement in quality is greater than ever before as the cost of spraying for four times runs around twenty cents per barrel while the difference in price between No. 3's and No. 1's is averaging around $2.50.

Duing the past three months one of the most misleading arguments ever put forward against spraying has been going the rounds of the Valley. The contention is that it will not pay to spray so long as the evaporators and canners will pay $1.50 or $2.00 tree run for apples. If the canners were able to pay $5.00 per barrel tree run it would pay to spray and the more they pay the better it will pay to spray, for spraying not only gives more apples but it gives larger apples and controls the insect pests and any one of these will pay for the spraying and leave the other two together with imporvement in quality as clear gain.

Increase in Quality of Fruit Alone Pays for the Spray

Here in Nova Scotia we are always in danger of an early infection of apple scab affecting the stems of the blossoms and runining the set in unsparyed orchards. In 1913 a person only needed to look at the trees in the fall in order to tell the owner whether he sprayed before the blossoms the previous spring. Where there was a crop of apples it was a sure indication that the owner had sprayed before the blossoms the previous spring, for where the early sparys were neglected that year the stems of the apples invariably became infected by apple scab and the set and crop ruined.

Some years ago I told you of an orchard in which we demonstrated the value of spraying in increasing crops. In 1915 we sprayed an orchard in Annapolis that had not given over 25 barrels per year for the four previous years, and in 1914 only 16 barrels. The year we sprayed it, 1915, it gave 85 barrels. In 1916 it was not sprayed but it gave 160 barrels, demonstrating what is the general rule, that spraying increases the crop of the coming year more than it does the crop of the present year. In spite of this demonstration the owner did not keep up his spraying after we left it, and in 1917 and since the crops have been about the same as in 1914 and before.

Insect Control Alone Pays for the Spray

Spraiyng will reduce insect pests as the Budmoth, Fruit Worms, and Coddling Moth, which are always present in small numbers, and is an insurance against outbreaks of such insects as Canker Worm, Tent Caterillar and Tussovk Moth which periodically defoliate unsparyed orchards thereby causing the loss of from two to four crops in the defoliated area.

Increase in the Size of the Fruit Alone Pays for the Spray

The fact is not often recognized that a sprayed tree not only grows cleaner fruit, more fruit and more regular crops, but it grows larger fruit.. On an average enough larger fruit to pay for the cost of spraying. The increase in size due to spraying seems to vary with the susceptibility of the leaves of that particular variety to apple scab. Recognizing that most of the solid matter of the apples must originally be taken through the leaves as carbon dioxide, this is most reasonable. Spraying or keeping the leaves free from fungus theefore enables the leaves to gather more plant food from the air and so grow larger apples. This benefit would be at the maximum in such varieties as McIntosh, and at the minimum in such varieties as Blenheim.

In the S. B. Chute orchard this year the results on this point were as follows:

Variety, Gravenstein — Average on 5,500 apples.

	No. of tree run apples required to fill 1 bbl.
Sprayed with the 1919 Spray Calendar	392
Unsprayed	440

This shows an increase in size of 12.76 per cent. Valuing tree run Gravensteins at $2.00 per barrel this increase is worth 25½ cents per barrel or more than it costs to spray four times.

Results on size of apples in the orchard of . Grevatt.—McIntosh.

	No. of tree run apples required to fill 1 bbl.
Sprayed with the 1919 Spray Calendar	690
Unsprayed	1956

Disregarding improvement in quality altogether and considering only the increase in quality, increase in size and insect control, no man can afford not to spray even if all his fruit is grown under contract to evaporators and canners at the price of domestic and No. 3's.

I am convinced that, so far as Nova Scotia is concerned, that if all of the ochards were sprayed there would be a great total quantity of canners and evaporators in the country than if no spraying were done. In other words our experiments go to show that if an unsprayed orchard produces 500 barrels of apple fruit for the canners and evaporators only it would, if sprayed, grow more apples for the canners and evaporators than before, and in addition form 500 to 1,000 barrels of No. 1 and No. fruit.

That argument is backel up by the fact that the canning and evaporating people are abandoning districts which formerly were large apple producers but which have neglected their orchards during the past five years and are now building expensive and apparently permanent establishments here in the Annapolis Valley where we have continuously kept our orchards in a good producing condition.

If we do not spray our production will drop off in quantity just as surely as it drops off in quality.

The Spray Calendar

This is the first year for the past five that I have not come here to advocate a radical change in the Spray Calendar. We have at last developed our recommendations to a point where they seem pretty nearly perfect for Nova Scotia conditions. Our present calendar is as follows:

1st spary—3-10-40 Bordeaux, 1 lb. arsenate of lime to 40 gallons.

2nd spray—2-10-40 Bordeaux, 1 lb. arsenate of lime to 40 gallons.

3rd spray—1 lb. soluble sulphur, 5 lbs. hydrated lime, ½ lb. arsenate lime to 40 gallons.

4th spray—2-10-40 Bordeaux, 1 lb. arsenate of lime to 40 gallons.

This has given perfect satisfaction in freedom from russeting, absence of dropping of fruit, and good foliage, and it has in most cases given excellent contol of apple scab. In cases where scab is hard to control, or where it is customary to apply smaller amounts of spray than the average, it might be preferable to make the second and fourth spray a 3-10-40 Bordeaux. Better scab control will result and the increased amount of russeting would be very slight.

In ergard to mixing Bordeaux after the Thompson formula. We published in our spray calendar last year a method of mixing which I devised and which calls for the handling of dry materials only. The pulverized copper sulphate and hydrated lime will be available in quantity this year through the United Fruit Companies, so you will not need to bother dissolving copper sulphate in advance or slaking lime. The formula and method of mixing is on the Spray Calendar which we have here for distribution.

Lime Sulphur Injury

This year we again tested lime sulphur for its effect in the removing apples and as usual got a very serious drop of fruit from the use of lime sulphur in the fourth application. The second and third applications did not give any indication of a drop in 1919 such as we got from them in 1918 and 1917. It is very satisfactory to be certain that we were right in advising you to change to the Thompson Bordeaux for I am now satisfied that lime sulphur has at least been partially responsible for the short crops between the years 1911 and 1919. Substantiating this statement is the fact that M. Thompson and Mr. Buchanan who have used the new Bordeaux since 1915 have had large crops continuously, while the crop in the majority of orchards was small, as indicated by the total. Lime sulphur injury usually carries over and injures one or more succeeding crops. I know in my own orchard that I hired the spraying done in 1914 and had apples only in the tops of the trees higher up than the spary rods would reach. I did not then dream of lime sulphur causing a drop of the apples. I remember the next spring, 1915, the tops of my trees were full of blossoms while the sides had only a few and at that I did not realize that it was lime sulphur injury until Mr. Thompson showed me the injury in his orchard. In this connection Mr. F. H. Johnson tells me that the four Wagner trees which we sprayed with lime sulphur in 1915 and from which we removed the fruit, stood bare of fruit during the years 1916, 1917 and 1918, while the trees around them were bearing full crops. I saw them myself in 1917. This year these four trees had the first good crop on the since 1914.

We could go on and produce an endless string of evidence to show that lime sulphur has been at least partially responsible for our having less than one million barrels of apples in Nova Scotia per year from 1912 to 1918, whereas in 1911 we had 1,735,047 and in 1919 after generally going back to Bordeaux close to 2,000,000 barrels. It may interest you to know that even today Prof. Brittain and I are standing alone among the Entomologists and Plant Pathologists of America in condemning lime sulphur as a summer spray on the apple.

One injury from lime sulphur that has never before been noticed is the fact that it reduces the size of the fruit. This is reasonable in view of the fact that lime sulphur injury, we believe, is an injury to the chlorophyll of the leaf so lessening the food gathering power of the leaf. The following table shows the reduction in size of three varieties of apples on account of lime sulphur injury:

Dusting

A great number of experiments have been conducted and much writing done on the subject of dusting during the last few years. The high cost of material, the fact that results from it were not always good, and the fact that a good contact dust was not known, were objections that kept us from considering the method seriously until the winter of 1917-18. The first objection has now been def-

	No. apples required to fill 1 bbl. McIntosh	Ben Davis	Wagner
Nova Scotia 1919 Spray Calendar	690	655	788
Lime sulphur, Arsenate of lead 4 sprays	780	748	855

initely removed. The second now appears less formidable than in the past, while there seems good reason to believe that the third will also be removed. Removing the third objection or the developing of a contact dust is in the hands of Prof. W. H. Brittain and I will therefore not refer to it.

Sulphur Dust

During the past year a great deal of sulphur lead arsenate dust or 90-10 was used in the Annapolis Valley. A proportion of this came in ready mixed and a portion was mixed by the United Fruit Companies. There seems but little difference in the results from the two. The following results were obtained by Mr. C. M. Roscoe, of Centreville, from the dust mixed by the United Fruit Companies. His program was as follows:

2nd dust—90-10 sulphur lead arsenate
3rd dust—85-15 sulphur lead arsenate
4th dust—90-10 sulphur lead arsenate

Percentage of apple scab on Gravensteins: Dusted, 9.64; untreated, 97.5.

On the whole the results from dusting with sulphur during the past season were remarkably good. I think that the good results were largely due to the fact that most of the dust was applied in the morning, when the air was still, and the trees damp, or on still, foggy days.

On an orchard that required 150 gallons of liquid spray per application per acre we used 75 pounds of 90-10 sulphur lead arsenate dust per application per acre.

Copper-Lime-Arsenate Dust

This material has as yet hardly had a trial as it is only two years now since we happened to get the idea of making it and only last month we were awarded a patent on it by the United States Government.

Last year we made the new dust so that anyone applying 75 pounds per acre per application would put on the same amount of copper as are contained in 50 gallons of 2-10-40 Bordeaux. In practice we found it very difficult to apply as much as 75 pounds per acre. In our experiments at Mr. Chute's we applied only 55 pounds or only 81% as much copper as we applied in the liquid spray plot. On analysis we found 85% as much copper on the leaves as on the liquid sprayed leaves, thus indicating that there is less wastage of material in dust than in liquid spraying and as the scab control from the new dust and the Spray Calendar was practically identical, it also indicated great fungicidal value per unit of copper employed.

This year we are increasing the copper and arsenic content of the new dust by 25%, making 50 pounds the full equivalent, in copper and arsenic, 150 gallons of 2-10-40 Bordeaux and the equivalent in spreading value of 75 pounds of sulphur dust. The formlua which we will use on the apple in 1920 is ten pounds of dehydrated copper sulphate, five pounds of arsenate of lime, and eighty-five pounds of hydrted lime.

This experiment shows the sulphur giving the best results, but I do not think from observations that it would do this on every occasion. In one experiment Porf. Brittain used the new dust at the strength we are recommending for 1920, and it gave better results than sulphur dust.

Cost of Dusting Vs. Cost of Spraying

Accurate results as to costs of applying dust and liquid were worked out in the S. B. Chute orchard, and the whole later brought to an acre basis for comparison.

Cost of Applying Four Applications of Dust per Acre.—Time, 16 Minutes for Each Application

Two men 1 hour and 4 minutes each at $0.25 per hour	$0.53
Team 1 hour and 4 minutes at $0.35 per hour	0.37
Interest on dusting outfit, $290 at 6% $17.b0 per acre 1/10)	1.74
Depreciation on outfit 10% on duster, $140 $14.00	
5% on engine, $100 5.00	
5% on truck, 50 2.50	
$21.50	
Per acre 1/10	2.15
Gasoline .21 of a gallon at $0.40 per gallon	.08
Cost of applying per acre	$4.87

Cost of Spraying Liquid Spray per Acre, Four Applications.—Time, 1 Hour and 20 Minutes for Each Application

Two men 6 hours and 40 minutes each at $0.25 per hour	$3.32
Team 6 hours and 40 minutes at $0.35 per hour	2.33
Interest on spray outfit, $450 at 6%, $27.00 (per acre 1/10)	2.70
Depreciation $450 at 15%—$57.50 (per acre 1/10)	6.75
Gasoline 1.6 galons at $0.40 per gallon	.66
Cost of applying liquid per acre	$15.76

The results in the S. B. Chute orchard were obtained from 73 pounds of sulphur dust per acre, 54 pounds of copper-lime-arsenate dust per acre and 150 gallons of liquid spray per acre. In increasing the strength of the copper lime arsenate dust we are reckoning on applying 50 pounds of copper-lime-arsenate dust or 75 pounds of sulphur dust to an acre requiring 150 gallons of liquid, per application, on an acre of 20 to 25 foot trees.

The costs of material for liquid spraying, four applications, following the 1919 Spray Calendar is, according to 1920 prices, $7.21 per acre, which makes the total cost of spraying an acre four times $22.97.

The cost of dusting depends largely upon the cost of dust. On account of the immense buying power of the United Fruit Companies, and the fact that the only way to get low priced 90-10 sulphur lead arsenate is to import the sulphur and buy Canadian made lead arsenate and mix here, enables the Fruit Companies to put out 90-10 for around $6.00 or $7.00 per hundred pounds. The copper-lime-arsenate dust will cost around $5.00 or $6.00 per one hundred pounds.

Table showing cost of four applications of 90-10 sulphur dust at various prices, using 75 pounds per application or 300 pounds per season:

When 100 lbs. of material costs	Cost of material per acre	Expenses of application	Total cost per acre
$3.00	$9.00	$4.87	$13.87
3.50	10.50	4.87	15.37
4.00	12.00	4.87	16.97
4.50	13.50	4.87	18.37
5.00	15.00	4.87	19.87
5.50	16.50	4.87	21.37
6.00	18.00	4.87	22.87
6.50	19.50	4.87	24.37
7.00	21.00	4.87	25.87
7.50	22.50	4.87	27.37
8.00	24.00	4.87	27.37
8.50	25.50	4.87	30.37
9.00	27.00	4.87	31.87
9.50	28.50	4.87	33.37
10.00	30.00	4.87	34.87
10.50	31.50	4.87	36.37
11.00	33.00	4.87	37.87
11.50	34.50	4.87	39.37
12.00	36.00	4.87	40.87

Table showing cost of four applications of Copper-Lime-Arsenate dust at various prices, using 50 pounds per application, or 200 pounds per acre.

When 100 lbs. of material costs	Cost of material per acre	Expenses of application	Total cost per acre
$2.00	$4.00	$4.87	$8.87
2.50	5.00	4.87	9.87
3.00	6.00	4.87	10.87
3.50	7.00	4.87	11.87
4.00	8.00	4.87	12.87
4.50	9.00	4.87	13.87
5.00	10.00	4.87	14.87
5.50	11.00	4.87	15.87
6.00	12.00	4.87	16.87
6.50	13.00	4.87	17.87
7.00	14.00	4.87	18.87
7.50	15.00	4.87	19.87
8.00	16.00	4.87	20.87
8.50	17.00	4.87	21.87
9.00	18.00	4.87	22.87
9.50	19.00	4.87	23.87
10.00	20.00	4.87	24.87
10.50	21.00	4.87	25.87
11.00	22.00	4.87	26.87
11.50	23.00	4.87	27.87
12.00	24.00	4.87	28.87

During 1920, therefore, four applications of the 1919 Spray Calendar will cost $22.97 per acre; four applications of sulphur dust will cost $22.87 to $25.87; and four applications of copper-lime-arsenate dust will cost $14.87 to $16.87 per acre. In other words, dusting with the copper-lime-arsenate dust next year will cost from $6.00 to $8.00 less than liquid spraying or dusting with sulphur. I may here say that there is a strong prospect of our being able to still further reduce the cost of the copper-lime-arsenate dust.

On account of the dust having less sticking power than the liquid it is probably best to apply the material five times in place of four. That is follow the weather more than in liquid spraying.

If one is using the copper-lime-arsenate dust it might be best to put in a 90-10 sulphur lead arsenate dust on the third or Calyx application, on varieties that russet easily like Ben Davis. The new dust will give about one-half as much russeting as a 2-10-40 Thompson Bordeaux, and that in turn will give about one-half as much as a 2-2-40 Bordeaux, but if it is applied to susceptible varieties on the Calyx application some noticable russeting will result.

The copper-lime-arsenate dust is new and I want you to expect some changes in the formula as we work towards perfecting it. The formula that we now have has, in most cases, given excellent results, but there is every probability that we can not only imporve it, but make it much cheaper.

I do not want to persuade any of you who are spraying to leave it for dust, but if any of you will not spray I would certainly advise you to dust. Your results will probably be almost if not quite, as good as from liquid spraying.

I do not believe that a dust machine should do as many acres as the makers claim for it. I believe that the dust should be applied when the air is still and the trees damp or from four to eight o'clock in the morning. One can reckon on treating from twelve to fifteen acres each morning in this way. I would not advise anyone to dust in the wind or when the trees are dry.

One of the biggest advantages of the dust is that a man can treat his orchard when he cannot attend to crops on account of dew, while spraying must be done in weather well adapted to other farm work. Thus not only saving time but exchanging good crop weather for treating the orchard.

I have tried to be impartial in summing up our experience with the two methods and not favor either too much for I am sure that there a place for both for several years to come.

Everyone has seen a grain of oats. It is very small and common looking and yet it contains a living plant. The examination of an oat grain shows that it is made up of two main parts, the outer covering or the hull, and the kernel containing the germ or young plant. The hull serves to protect the kernel but is of little value for food, therefore the oat with a thick heavy hull is not the best kind to grow. "A guide in the Study and Improvement of Plants and Seeds" is a pamphlet prepared by the Canadian Seed Growers' Association, and istributed free upon application to the Publictaions Branch, Department of Agriculture, Ottawa. It has been prepared as a guide for boys and girls in the study and improvement of seeds and plants. Owing to the oat's relative importance among cultivated crops, and to the fact that it lends itself admirably to special investigation, it has ben chosen for this study. What is said about this plant as regards methods of improvement will apply equally to wheat and barley but not to corn or potatoes or to the grasses and clovers.

Culling the flocks in the fall insures that the feed will be consumed by the best producing hens and saves those that will make the best breeding birds. Among the pullets those that are hatched early in the season, that mature early and have begun to lay in the fall are generally the birds that should be kept.

Gleanings of Agricultural Progress in New Brunswick

DEVELOPMENT OF THE DAIRY INDUSTRY IN NEW BRUNSWICK

Marked progress has been made in the quality of the dairy products in the Province. Two years ago cheese buyers were afraid to touch the output of many New Brunswick factories. To-day the relationship between the buyer and seller is very satisfactory. The cheese is graded by Department officials and these grades accepted by the trade. This has resulted in a very marked improvement in the general quality of the cheese going on the market. New Brunswick cheese is fast approaching as high a standard as that put out by any other part of Canada. Marketing facilities were greatly improved by the organization of a Cheese Board in the spring of 1919. Every two weeks factory managers boarded their cheese and it was sold by auction on a competitive market, buyers from the larger firms being present to bid in the offerings. This system of marketing met with marked success. It was more satisfactory to both buyer and seller. The buyers could get their supplies without having to hunt all over the province for them. Higher prices were secured than would have been obtained under the old system of selling.

A Dairy Show and Convention was held at Sussex early in December, 1919. Butter and cheese from nearly all the creameries and cheese factories in the province was on exhibition. These products represented the regular make of June, July, August and September. The Cheese and Butter was scored by competent judges and prizes awarded to makers and factories coming up to a certain standard. Much valuable information was obtained by the makers in comparing the quality of their product with that put out by other factories.

The Dominion Butter Scoring Competition was also entered into by a number of the creameries in the province. The showing made in comparison with other provinces was very good and indicates that a high quality product can be produced in the province.

The policy adopted by the Department in encouraging and assisting the Central Creamery plan is proving sound. The Moncton Creamery, which began operations in 1918, will in 1919 pay out nearly four times as much money to patrons as in 1918. The number of patrons has increased from three hundred to six hundred. This Creamery is rapidly forging ahead. The making of ice-cream was commenced during the past season. This part of the business will be enlarged considerably next year. The company will find it necessary to enlarge the whole plant in order to take care of the increased business. A Chemical Cold Storage is being installed.

Attention is also being paid to the Creamery at St. Hilaire in Madawaska County. The Department have been assisting in getting this creamery on a sound basis. The output was materially increased over 1918. Meetings will be held during the coming winter and an effort made to secure more patrons for nert year. There is a splendid plant and equipment at this place and an unlimited market for butter at top prices. With a larger volume of business the creamery will soon be on a sound basis.

The establishment of these large Central Creameries has brought about a development in the Dairy Herds of the province. More and better cows are kept as a result of the superior market for cream which the creameries provide.

With the hearty cooperation of the milk producers, the makers and the Department, the next few years will see a rapid development of the dairy industry in the province.

A definite start has been made toward the establishing of a Farmers' Cooperative Creamery at Fredericton. The company is incorporated and is now selling stock. The capitalization is $25,000 divided into 1000 shares of $25.00 each. An outline of the proposal will be found on page 381 of this issue. When this creamery is established, the Province will be well served with creameries.

As an indication of the development of dairying in New Brunswick, the following statistics are suggestive:—

NEW BRUNSWICK DAIRY STATISTICS, 1919

Butter Production

Year	Creamerics Reported	Patrons	Lbs. Milk Received	Lbs. Cream Received	Lbs. Butter Mfgd.	Value Butter
1919	17	1692	3,088,668	3,154,700	915,816	$504.602.22
1918	15	1352	3,244,017	2,504,912	660,884	297,397.80
1917	14	861	801,660	719,238	500,050	199,686.33
1916	21	1263	783,587	2,499,916	709,932	236,194.38
1915	20	1235	858,681	2,792,955	776,416	231,837.82

Increase in 1919 over 1918, Butter Manufactured, 254,932 lbs., Value $207,204.42

Cheese Production

Year	Reported Factories	Patrons	Received Lbs. Milk	Mfgd. Lbs. Cheese	Cheese Value
1919	24	675	12,898,003	1,256,388	$347,772.02
1918			12,111,317	1,174,362	264,304.05
1917			11,150,000	1,115,753	232,527.36
1914	24	555	10,168,839	1,022,026	138,714.73
1912	23	595	10,248,723	1,022,646	130,859.53

Increase in 1919 over 1918, Cheese Manufactured, 82,026 lbs., Value $83,467.07

INJURY TO FRUIT TREES FROM HEAVY SNOW

Dear Sir:—

The recent heavy storms have brought the depth of snow in many orchards well up into the crotch of the trees, a heavy crust first forming a considerable distance from the ground—from 18 to 20 inches—and on top of which subsequent storms have piled in.

It is important that the forks or crotches of all trees now filled with snow should be cleaned out or the snow broken down by foot or club—otherwise branches may be broken off by the heavy weight or crotch damage may result from alternatc freezing and thawing and consequent injury or destruction of the tender growing cells of the bark.

In the case of young trees—from one to ten years—unprotected against mice injury—the crust should be broken through and the snow tramped down firmly around the trunk.

To prevent the possibility of serious damage, immediate attention to your orchard is urged.

Yours very truly,
A. G. TURNEY,
Horticulturist.

BARRED PLYMOUTH ROCKS

Hatching Eggs Day-Old Chicks
from heavy laying strains

imported by the Poultry Division, Department of Agriculture, Fredericton, from the highest laying strains in Maine and the province of Ontario.

Birds from our importations on 1st, 3rd, and 6th places, for number of eggs laid, in the P. E. Island laying contest last year, in competition with pens from the 5 Eastern Provinces. They averaged 29.2 eggs each more than the alance of the contest birds.

In the present laying contest at Nappan, N. S., the entries from New Brunswick are leading.

Eggs 10c each, Chicks 25c each, both F. O. B. Fredericton.

Cash with order.

A. C. McCULLOCH,
Poultry Superintendent,
Department of Agriculture, Fredericton

NEW BRUNSWICK SEED FAIRS

Seed Fairs are eing held at the following points and dates in the province:—

Chatham, February 24th; Port Elgin, March 2nd, Florenceville, March 10th; Provincial Seed Fair, and York County Seed Fair, Fredericton, March 17th; Sussex, March 27th; Buctouche, March 30th; St. Hilaire, April 2nd.

Canadian Ayrshire Breeders Association Annual Meeting

The annual meeting of the above Association, held in Toronto, on Feb. 5th, was one of the best ever held in that city. A most progressive policy was outlined and legislation passed, which, if backed up by the breeders should bring splendid results to Ayrshire men.

That there was need of a more progressive policy was evident and legislation shaped towards that end as the following lists of resolutions will show:—

Two classes were made for the Record of Performance,—a. Continue the present test with the fifteen months freshening requirement eliminated. b. Establish a 305 day test with a freshening period of 400 days; the publication of a monthly periodical was authorized and a committee appointed to take care of publicity work; it was recommended that Fair Boards be asked to raise prizes in keeping with the present cost of showing; in order to stimulate testing in the R. O. P. it was decided to offer a special prize of $50. for every cow breaking a previous record, and to give $100. to the owner of the first Ayrshire cow in Canada to give over 20,000 of milk a year, under R. O. P. rules; the system of Accredited herds was approved, and a resolution passed asking Fair Boards to provide stables at Exhibitions for cattle from Accredited herds; the Constitution was amended to provide for proportionate representation by zones. This will enable Quebec province to have 6 Directors, Ontario 5, Manitoba and Saskatchewan 1, Alberta and British Columbia 1 and the Maritime Provinces 1; grants for prizes at Fairs and Exhibitions were increased from 25 to 100 per cent, and delegates and judges to Fairs appointed. A resolution was also passed approving and supporting the new Royal Agricultural Winter Fair and Dairy Show at Toronto. The Association voiced its disapproval of any interference with the length of the working day on the farm, either by labour unions or legislatures, and also disapproved of Daylight saving, so called.

Both the president and secretary in their reports voiced their opinion that the future of the breed in Canada, must be built on the intelligent use of the Record of Performance test.

That there was need of more funds to "carry on" with increased expense for administration and publicity work was evident, and to meet this emergency the annual members fee was raised to $4. in 1921, and the Registration fees were also increased as follows:—Registrations, to MEMBERS—Females, under ONE year, $2. Males, under ONE year, $3., Males or Females, ONE year and under TWO years, $5., Males or Females, TWO years and over, $10. Transfers, if made within 60 days from date of sale, $1., Transfers, if made after 60 days from date of sale, $2., Duplicate Certificates, .50, Old Form Certificates changed to National Certificates, .50c, For recording pedigrees of ancestors, $1., Imported animals, $5. To NON MEMBERS—Females under ONE year, $3., Males under ONE year $4., Males or Females ONE year and under TWO years, $8., Males or Females, TWO years and over, $10., Transfers if made within 60 days from date of sale, $2., Transfers, if made after 60 days from date of sale, $3., Eliminate free transfer at present granted to second owners when applying for registration. These fees to come into effect on May 1st, 1920.

Mr. H. S. Arkell, Live Stock Commissioner was present and gave a brief address, intimating to the breeders that we are approaching a critical time in the development of the live stock industry in Canada. He advised breeders to consider what the future holds in store for the industry, and to begin a reconstructive policy with the future in view. Dr. Hilton, of the Health of Animals Branch, fully explained the Accredited herd system. Prof. Archibald, Director Experimental Farms, advocated the making of bigger records in the R. O. P. and told what they were doing for Ayrshires on a number of the Experimental farms throughout Canada.

The following Directors were elected:—Eastern, R. R. Ness, Howick, Que.; M. Ste. Marie. Compton, Que.; J. H. Black, Lachute, Que.; Gilbert McMillan, Huntingdon, Que.; Hector Gordon, Howick, Que.; Frank Byrne, Charlesbourg, Que.; Bert R. Brown, Little York, P. E. I.

Western—W. W. Ballantyne, Stratford, Ont.; John McKee, Norwich, Ont.; Alex. Hume, Campbellford, Ont.; A. S. Turner, Ryckman's Corners, Ont.; Wm. Hunter, Freeman, Ont.; George Gillespie, Ventnor, Ont.; Sam Shannon, Cloverdale, B. C.

At a subsequent meeting of the Directors, Gilbert McMillan was elected President, Wm. Hunter, Vice-President and W. F. Stephen, Secretary-Treasurer for the 16th year.

Life is a solemn reality based upon eternity and encompassed by eternity. Find out your task; stand to it; the night cometh when no man can work. —T. Carlyle.

Notes From the Nova Scotia Agricultural College

NOTES ON FERTILIZERS

In this year's report of the Secretary for Agriculture, under the heading of the Farm Superintendent's report, there is a very interesting account of the use of Nitrate of Soda. A thirty acre field of run out land was sown to oats, with various fertilizers applied in sections. These were crossed with strips here and there to which nitrate of soda was applied at the rate of 100 lbs. to the acre.

The most striking fact to be deduced from the tests thus made was that the addition of this material to slag, acid phosphate, bone meal, ilme phosphate, etc., increased the productoin by 10 bushels per acre. Nitrate of soda can be bought this year at from $4.00 to $5.00 a hundred. In other words, the cost of an effective appli cation is, say, $4.50 per acre. An extra ten bushels of oats at present market prices is worth at least $10.00.

Farmers in the Annapolis Valley region are each year increasing their use of nitrate of soda. The Annapolis Valley United Fruit Co. alone has been buying 100 tons more each year than the preceding one.

Practically every kind of crop responds with increased yield to the use of this kind of fertilizer. It may be applied either before seeding or after the plants are up. The only precaution to be observed when applying after is to be sure that the plants are dry.

Nova Scotia farmers, outside the Annapolis region, have not heretofore used nitrate of soda in any great quantity because of the seeming high price. This, however ,is more apparent than real. While it costs about $100 per ton, the quantity used is only about 1/5 as much as is necessary of other fertilizers.

The Secretary for Agriculture was recently looking over the record of sales made by one of the largest Fertilizer firms in Eastern Canada. He was struck with the fact that N. B. farmers, particularly those of the large growing sections, are buying nothing but high grade fertilizers, while N. S. farmers in the main are investing in the low grade materials. This is poor business on the part of the latter. Low grade fertilizers are made low by the addition of sand or other inert and useless matter. Thus the purchaser of these is simply paying for stuff that he has abundance of all over his farm, and incidentally enriching the transportation companies by paying freight on it.

At the recent Annual Meeting of the Nova Scotia Farmers' Association ,held at Kentville. Mr. Margison of East Centreville ,N. B., a man recognized as one of the most successful potato growers in that province, gave a very practical talk on Potato growing. What he said about fertilizers is worth considernig by every Nova Scotia farmer.

He stated that he could not afford to use anything but the high grade fertilizers. While they cost more per ton, they cost less per unit of plant food. The low grade material is simply sanded down.

Mr. Margison himself uses 5-7-7 potato fertilizer, i. e., 5% ammonia, 7% phosphoric acid and 7% potash. Farms that have been well supplied with barnyard manure may not require so large a quantity of potash, but experiments carried on at the Agricultural College farm have clearly shown nthat the fertilizers with a high content of ammonia and phosphoric acid are always cheaper in the long run, and that potash in large quantities should be applied on lands which have not been enriched by heavy applications of barnyard manure.

The speaker also stated that he applied these high grade materials at the rate of 1500 to 2,000 llbs. per acre, which is at least double the amount used by the average Nova Scotia potato grower. Except on very rich soil, it paid Mr. Margison to use this large quantity, and the same experience doubtles would fall to the lot of any other farmer who makes a like outlay.

The whole question of commercial fertilizers is one on which the farmer needs to apply the same keen intelligence he is in the habit of showing on other questions. Cheapnesss must not be the criterion of choice. This is one line in which cheapness should repel.

The Secretary for Agriculture used a rather striking illustration at a recent gathering of farmers in Truro. He said that the man who chose low grade fertilizers on account of its cheapness is like a man who goes to an apple dealer with $3.00 when the market price is $4.00, and, unable to buy a barrel at his own price, asks the merchant to put in as many as he can for that money, and to fill up the barrel with stones so that he will will have a barrel-full anyway. Low grade fertilizer is made up more cheaply in exactly the same manner. Anyone who feels that he would like more information on the whole question would do well to write to the College.

ECHOES FROM THE DAIRYMEN'S CONVENTION

Nova Scotia manufactured 331,439 lbs. more of creamery butter in 1919 than in 1918. The Creamery butter production of the Province now runs away over the million mark.

If butter is to have good keeping qualities, the cream must be right to begin with. Then it must be pasteurized.

A large and properly equipped Dairy School is an immediate necessity in the Maritime Provinces if they are to keep pace with the Dairy world.

Cream grading is an effective step toward improving the quality of butter.

The Dominion Educational Butter Scoring Contest is a big move in the right direction. Canada needs a medium whereby to secure a uniform quality of butter from East to West.

The time has arrived when more definite knowledge of the cost of producing a quart of milk, or a pound of butter fat, should be available to any enquirer. This is a piece of work which can best be done by the Dairy Division, N. S. Department of Agriculture.

Railway employees should 'Have a heart." Our milk and cream cans ought not to be treated as if they were footballs. They are easily damaged, and they are expensive.

The Summer Butter Competition has been a good thing, but there has been opportunity to do some 'selecting." We hope the new directors will eliminate this.

Among the many good moves made during this year is the moving of the Dairymen"s Convention to the Dairying towns. Accordingly, Bridgewater is to be the next place of meeting.

The Dairymen's Associdtion must branch out and do smething to stimulate milk production.

Now we are attaining our majority, and are to be the first Agricultural Association to walk alone. The Association aims to be absolutely self-sustaining henceforth. Give us your good wishes.

R. B. McLennan has proven himself a good inspector, and an effective instructor. We are sorry to lose him, but wish him every success in his enlarged business at Truro.

Harry Brown is laying the foundations of dairying in cow testing and herd improvement, and doing it well. These are first essentials.

Canadian Co-Operative Wool Growers, Limited

The Second Annual Meeting of the Canadian Co-operative Wool Growers, Limited, was held in the office of the Company at 128 Simcoe Street, Toronto, February 5 and 6th, 1920. Delegates from parctically every Sheep Breeders' and Wool Growers' Association in Canada were present to go into the work of the year just closed and to formulate the policy of the organization for 1920.

These delegate shareholders were as follows: J. E. Davidson ,S. A. Logan, Nova Scotia; W. H. McGregor, P. E. Island; T. Hetherington, New Brunswick; Wm. Hay, E. E. Temple, J. R. McDowell, M. Ste. Marie, J. A. McClary, Quebec; W. A. Dryden, Col. Robt. McEwen, J. E. Cousins ,Ontario; Geo. Gordon, W. I. Smale, J. R. Hume, Miss E. C. Hind, Manitoba; J. D. Wilson, W. W. Thomson, Geo. Sutherland, Wm. Kerr, J. L. Beattie, Saskatchewan; J. W. Renton, Bishop Harker, Richard Knights, W. G. Smith, Alberta; and Geo. C. Hay, British Columbia.

The Balance Sheet of the organization as at the close of the financial year ending 31st December, 1919, together with a statement of the Profit and Loss Account ,were presentetd to the meeting. The profits for the year, after paying the cost of management and all other exenses, amounted to $33,589.66. A dividend of 6% per annum was declared payable March 1st, 1920 on the Paid Up Capital Stock as on the books as at 31st October, 1919, while after providing for a general Reserve and a Reserve for Income Taxation purposes, the balance, some $10,000.00, is to be distributed to patrons of the organization according to the business done.

Many representatives of the Provincial Departments of Agriculture and the Dominion Department of Agriculture were present and these men contributed towards the success of the meeting.

Mr. H. S. Arkell, Live Stock Commissioner, Ottawa, in addressing the meeting congratulated the delegate shareholds present on the success that has been achieved. He outlined the plan of co-operation with this organization for the coming year in grading the wool. The work of grading, which formerly has been done by the Department, will be continued during the coming year an much the same basis as past years except that the work would be centralized as far as possible, this being in accord with the views of the Canadian Co-operative Wool Growers, Limiited.

Weston Warehouse

During the year a warehouse, two storey, having a total of 40,000 square feet of available space, was erected at Western Ontaior, for the purpose mainly of handling the Western wools. This warehouse during the past season was taxel to its utmost so that with the proposed policy of centralizing grading it will be necessary to erect an additional storey before the wool season opens this year. The warehouse was erected at a cost of $73,143.60 and with the proposed addition the Growers will have a first class warehouse worth well over $100,000.00.

Lennoxville Warehouse

In order to competently handle wools from the Province of Quebec, rather than bringing them to Toronto, it was deemed advisable to construct a warehouse at Lennoxville, Quebec. This is already under way and it is now expected it will be completed by the 1st of May and will have a capacity of about 10,000 square feet.

Mr. Akeroyd's Address

Mr. Alfred Akeroyd, the Boston representative of this orangization outlined to the meeting the situation in the wool market of the finer grades of wool compared with the lower grades. He emphasized the continued demand throughout the season for fine wools while the lower grades were very much neglected. This naturally caused a very marked spread in price between the lower grades and the finne grades, the latter of which had a very considerable advance during 1919, while of the lower grades it is a very difficult problem to dispose of same satisfactorily in comparison with the higher priced wools. Another factor has been the dumping of wool by both the British and American Governments. The question was asked Mr. Akeroyd whether he would recommend the Canadian breeders to change their breed of sheep and produce fine wools. He answered emphatically "NO," for the demand would swing back for the long combing wools which Canada was producing. The very fact that the supplies of fine wool was nearly exhausted would ultimately swing back to the demand for tweeds and serges that could be made from the lower grade of wools.

Change in By-Law

By-law No. 38 of the Company provides for the rate of interest to be paid to shareholders and stipulates that the erserve fund should be 1% of the year's sales but at no time should exceed the Paid Up Capital. Notice of Motion has been given to amend this By-law and this amendment occasioned the longest disucssion of the Annual Meeting. The amendment proposed was "That the Board of Directors is authorized to so conduct the affairs of the Company as to provide a charge against all business sufficient for an annual payment of 8% on the Paid Up Capital and to provide, from year to year, such reserve fund as to the directors may seem encessary in the interests of the Company. Any further annual surplus in possession of the Company should be distributed to the patrons of the Company, whether shareholders or not, in porportion to the volume of business done.

Plans for the Coming Year

Plans for the coming year were very fully discussed and were finally consolidated into a series of resolutions for the guidance of the Board of Directors and the Executive.

One of the most important of these resolutions was to the effect: "That this organization during the coming year recommend to all shippers of wool that, with a view of establishing better grades on their product and as a result of a better market therefor, all wool be shipped to the central

(Continued on page 391)

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Fortnightly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

MARCH 2, 1920

FOR EASTERN FARMERS

The Harrisville Agricultural Society is the first to have a kick at the Western United Farmers plan for high priced flour and feed. Here is a straight-from-the-shoulder resolution (not dictated from Winnipeg), passed by the progressive farmers of Lewisville:

Editor Maritime Farmer,

Dear Sir:—

We, members of Harirsville Agricultural Society and other progressive farmers convened in our regular meeting, this tenth day of February, 1920, having considered your article in "Maritime Farmer," February 3rd, under the heading "A Narrow National Policy" in which you protest against a continuation of the unfair discrimination against the products of the Maritime Provinces by the favors given the wheat growers of the West and their expressed purpose at the recent grain growers' meeting at Manitoba, to request the Government for still more.

We would convey to you our appreciation for your timely article on this subject.

We consider the request for further favors to the West to be paid by us, unreasonable and positively detrimental to both Agriculture and labour in the Maritime Provinces.

If, for the flour and feed we receive from the West, we must continue to pay artificial prices, then our products, butter, milk, eggs, potatoes, etc., should also have government protection for special prices. If we follow the example of the organized farmers of the West re wheat, it must ultimately increase all and every necessity of life; a thing no one who regards the best interest of his country and his fellows can endorse.

We stand, irrespective of race, class, creed or political affiliation for a fair and equal deal to every man in every part of our Dominion. We therefore most heartily endorse your position and will stand with you to the last ditch for equal rights to all and special favors to none.

Lewisville gives the lead, what does your farm organization propose to do?

NATIONAL MARKETING OF WHEAT

National marketing of wheat is one of the biggest questions to-day before the farmers of the east. The United Farmers of the west are passing resolutions favoring the continuance of an arrangement which was designed to meet war conditions only. On the other hand, the Nova Scotia Farmers Association passed resolutions protesting against the high prices of feed. The western men are backing up their resolutions by sending delegates to Ottawa to urge their petition. The only logical answer to that is a delegation from the east, which should proceed to Ottawa, be there at the same time as the grain growers, and protest as vehemently as possible against any special treatment for western farmers as against eastern agriculturalists. The passing of resolutions will accomplish little. If something is not done to meet this demand, high prices will continue for feed and the men who must pay it are the stock owners of the Maritime Provinces. The time has arrived in Canada, when it seems that the man making the most noise, gets most attention at Ottawa. It is about time we, in the Maritime Provinces started to make more of a "holler". Noise has paid in the west. Let's start something down here in our own interest. In the meantime, the grain growers have several missionaries in the Maritime Provinces, telling our farmers how western hearts are simply bleeding in sympathy with us in our trials and troubles. Don't you believe a word of it, particularly if you are a stock raiser and need feed. The grain growers are getting ready to put one over. They may have nice things to say, but they have a brick in either hand for those who must buy feed. Let's go to Ottawa, too.

RATHER TOO MODEST

In introducing itself to the business and manufacturing interests of Canada, the United Farmers' Guide neglects to mention that it is controlled by the Grain Growers Guide of Winnipeg, and that it is being run in the interests of the grain growers. It is too modest. Surely it cannot be that it hides its profession under a bushel in order to win sordid dollars from the "Big Interests." Even Brother Chipman, the heavy gunner of the Grain Growers Guide, effaces himself when he appeals to the "Big Interests". In no place does his name find mention, although much prominence has been given to the prestige of his name in approaching Eastern farmers for subscriptions and sample copies of the Winnipeg paper have been used as bait for the unwary. The new journal and Bro. Chipman are modest little things.

FARMERS IN PARLIAMENT

There is plenty of room in the Dominion Parliament and the provincial legislatures for farmers. They will add to the usefulness of all these bodies and give the cultivators of the land that representation they deserve. But it is not necessary to send men there who are pledged in advance to do the bidding of the Winnipef Council of Agriculture. Let us in the Maritime Provinces send farmers to represent us, who will look to the welfare of Nova Scotia, New Brunswick and Prince Edward Island—men for instance who are not pledged to vote for high priced wheat, or by their silence to condone the attempt to inflict on eastern farmers the continuance of artificially priced feed and flour.

BREED UP

There is always plenty of room at the top in breeding pure-bred live stock of any class. The advice "grow into a pure-bred herd," which means purchasing a few good pure-bred animals for a foundation and gradually building up the herd, is very good for the majority of beginners in the pure-bred business. One is always justified in laying a foundation for a pure-bred herd when he has learned the art of selecting, feeding, and rearing animals that have merit in serving their purpose. Not until one has learned, however, the art of salesmanship and has established his reputation as an owner and breeder of pure-bred live stock, is he justified in disposing of too many good grade or native cattle and replacing them with pure-breds. It is a safe policy to grow into good pure-bred live stock and into the art of honorably selling the surplus as fast as possible. Such a policy will add wealth to all who adopt it and be of great advantage to the cattle industry.

LIME STOPS CLUB ROOT

Tests at the Ohio Experiment Station, Wooster, show that the club root of cabbage may be controlled by heavy applications of lime on the infected soil. From 70 to 80 bushels of limestone per acre are required to completely destroy the disease. Club root also attacks cauliflower, particularly when grown on soil infected with the club root of cabbage. The lime applied to control the disease is also effective in sweetening the soil, thus resulting in greater crop increases.

* * *

The Winnipeg Grain Growers proposed publication calls attention in its notice to advertisers that five per cent of the farm population of the Maritime Provinces has left the farm in the past ten years, and solemnly promises to correct this and to make life more pleasant and easy on the farm. Just as a starter, its onwers, the Grain Growers of Winnipeg, have given a lead by asknig Maritime Province farmers to continue to pay inflated prices for flour and mill feeds. No doubt the Maritime Province farmer full appreciates the tender solicitude in his behalf.

* * *

Well done, Lewisville! The first kick against high prices for wheat products comes from the home of the new Grain Growers Guide publication.

* * *

Another Westmorland farm organization on the outskirts of Moncton sends a list of 72 new subscribers to the Maritime Farmer this week, with its best wishes and promises more. The fight against the Western attempt to rob the Eastern farmer is being appreciated.

* * *

No discrimination against the east from Winnipeg.

* * *

We can elect our own farmer members without advice from the West.

* * *

We want men with Eastern ideas—uncontrolled by the voice of the prairies.

* * *

Organize Mr. Farmer, but contril your own organization.

* * *

Twenty dollar flour won't go down.

* * *

See that the fruit trees are pruned and set in condition for next season's crops. Before the spring work begins is a good time to do the job.

The N. B. Farmers' and Dairymen's Association

The forty-fourth annual convention of the New Brunswick Farmers' and Dairymen's Association will be held in the Assembly Hall of the Provincial Normal School, Fredericton, commencing at 9 o'clock on the morning of Tuesday, March 16th and continuing until the evening of the 18th.

The President of the Association is Mr. C. F. Alward, of Havelock, one of our most intelligent farmers, who has done a lot of institute work not only in his own province but also in the other Maritime Provinces and in Ontario. Every Agricultural Society in the province is entitled to send one or two delegates the respective societies paying in full their legitimate travelling and hotel expenses. The Department of Agriculture, in turn, refunding one-half of the expenses of each duly accredited delegate to the treasurer of the respective societies. For instance, Society No. 200 sends as its delegate Mr. B., who buys a single first class railway ticket to Fredericton and at the same time asks the station agent from whom he purchases it for a Standard Certificate. This Standard Certificate must be handed on the arrival of Mr. B. to the Secretary of the meeting, who will sign it and return it to Mr. B. This certificate when presented to either the C. N. R. or C. P. R. station agent at Fredericton, will entitle Mr. B. to a reduced fare for the return trip.

The total of Mr. B.'s railway and hotel expenses, we will say, amounts to $20.00. Mr. B. will be paid this amount and on presentation of Mr. B.'s expense bill by Society No. 200 to the Department of Agriculture at Fredericton one-half of this amount, which, in this case, amounts to $10.00 will be refunded to the Society.

Each and every society sending a delegate to the Association should place in the delegate's hands for introduction at the meeting any resolutions or features that they would like the Farmers' and Dairymen's Association to discuss.

The delegates should see to it that they are present at each meeting of the series and listen attentively to the discussion so that when the question is called they may vote intelligently. There will be ample room for discussions on the various topics that will be brought regularly before the meeting. Each and every delegate will be encouraged and is expected to take part in the discussions.

Following is the proposed program which is subject to revision:

Tuesday, 9 A. M.

Appointment of Committees.
Cloverculture and Seed Selection—O. C. Hicks.
Bee Culture—L. T. Floyd.
Horticulture—A. G. Turney.
Field Crop Competitions—M. A. MacLeod.
Open Discussion.

Tuesday, 1.30 P. M.

Dairying and Co-operative Creameries, A. E. Trites, Salisbury; H. W. Coleman, Sussex.
Breeding and Feeding Dairy Cattle—T. M. Trueman, Truro.
Open Discussion.
4 P. M., French Section—Mr. J. A. Ste-Naire, Ottawa.

Tuesday, 8. P. M.

President's Address.
Mayor's Address.
Reply by Vice-President.
Address—Minister of Agriculture.
Tabling of County Vice-President's Reports.
Fertilizers—Mr. H. G. Bell, Toron, to, Ont.
Open Discussion.

Wednesday, 9 A. M.

Poultry Raising—F. C. Elford, Ottawa; A. C. McCulloch, Fredericton.
Co-operation—J. D. McKenna, Sussex.
Marketing of Eggs and Fowls— G. R. Wilson, Moncton.
Open Discussion.

Wednesday, 1.30 P. M.

Sheep Husbandry—E. P. Bradt.
Marketing of Wool and Lambs—J. K. King, Moncton; Robert Donaldson, Sackville, N. B.
Open Discussion.
4 P. M., French Section—M. Tardif.

Wednesday, 8 P. M.

Pork Production—G. B. Rothwell, Ottawa.
Potato Spraying—George E. Sanders.
Potato Growing and Grading—A. A. T. Margison, Centreville, N. B.; G. B. Porter, Andover, N. B.
Open Discussion.

Thursday, 10 A. M.

Visit to Experimental Farm.
Lime in Agriculture—E. M. Taylor.

Thursday, 8 P. M.

Election of Officers..
Resolutions.
Soldier Settlement Board — Wm. Kerr, St. John, N. B.
General Discussion.

FIELD EXPERIMENTS

An Address by J. A. Clark, B.S.A., Supt. Dominion Experimental Station, Charlottetown, P.E.I., at the recent N.S.F.A. Convention

The field experiments that I will describe this afternoon are a few of a series that we have been conducting at Charlottetown. Your conditions differ from ours slightly and I will simply give a description of our work and let you draw the conclusions or ask questions, as discussion usually brings out the information that you wish most quickly.

Rotation experiments consist of 3, 4, 5 and 7 year rotations. Eradication of Weeds—A three year rotation was started nine years ago on a piece of land with ox-eye daisies and overrun with yarrow. The field had been used for a number of years as permanent pasture as it was wet and unsatisfactory for other crops. We drained the land in 1910 by placing tile about 2½ feet deep and 33 feet apart. The 6 inch main crossing the field diagonally. The area of each section of the rotation was 1 acre and the slope of land was to the west.

The purpose of the rotation was to destroy the perennial weeds present, Ox-eye daisy and yarrow, and to determine the increase in fertility of the land so treated. The plan of the rotation was: 1st year, a hoed crop, and we have usually grown potatoes; 2nd year, grain, this has been wheat; 3rd year, hay, and after the first round of the rotation this has given us good clover.

One section of the rotation after it had been broken from the permanent pasture sod for several years remained very badly infested with yarrow. This was manured on the sod at 15 tons per acre and plowed one year in early August after the hay had been removed. The plow was followed by a heavy roller to put the sod down the way it would not tear up with the cut-away-disc harrows. A double angle scrape of the harrow mentioned was given this field whenever the yarrow would show green between the sods throughout the summer or about every week or ten days. In late autumn the field was ribbed up across the face of the slope to prevent washing and to give the frost a chance to kill the roots of the plants. This effectually rid us of the old roots of the yarrow and the rotation prevented this plant from producing seed as it is like the ox-eye daisy which does not flower the first year after the seed germinates. A description of the handling of this section for one round of the rotation will illustrate our method. The land was levelled by using the spring tooth harrow lengthwise of the ribbing first time after the land was ready in the spring. Then the field was harrowed angleways, usually giving it a double angle scrape each time as it is much easier to turn the disc harrow on a small area in that way. When in good tilth the potatoes were planted with an Iron Age planter in rows 30 inches apart. The rows were levelled with the spike harrow which was used for cultivation until the plants were well above ground. When the potatoes were from 2 to 4 inches high the seed shoe, etc., were removed from the planter and the potato plants covered deeply by two covering discs of the planter; this destroyed many weeds and kept the bugs off for a time. The horse cultivator was used after each heavy rain throughout the early summer and the plants were sprayed with Bordeaux and poison regularly until autumn. The potatoes were dug and stored and the land ridged up in November. The following spring a good seed bed was prepared and the section sown out with 10 pounds red clover, 2 pounds alsike and 12 pounds of timothy with 1¾ bushels of wheat as the nurse crop. We are using our rotations for the multiplying of our best sorts of cereals, and usually grow 1 acre of Elite stock seed of a variety on the sections. This enables us to have a fair amount of first generation seed of all of the leading cereals for sale to breeders. We find the clover plants among the wheat frequently smother many weeds as it usually is up to the hands of the sheaves at harvest.

The third year of the rotation the clover hay is cut when in full bloom and in any event before the 25th of July, since we have found that ox-eye daisy does not mature its seed sufficient to reproduct itself if cut previous to that date. This completes the cycle of the rotation and as the weeds mentioned do not have any chance to mature seed it is only a question of starting all the seeds already in the ground and then destroying the plants to get your field entirely free. At the end of the first three years there was a marked decrease in the daisy; at six years only a sprinkling of the bloom was to be seen over the field and at nine years all the plants left could be easily hand picked and we have decided to cancel the rotation and use this land for other experiments that are now more urgent.

This three years rotation has produced a larger quantity of farm produce per acre than any of our other otations. It is planned for the eradication of certain weeds and is the cheapest method of destroying them when it can be used in connection with suffiicient permanent pasture it is one of the most suitable stock rotations. In 1918 the returns were: 1st year 360 bushels, 55 pounds potatoes; 2nd year 33 1/3 bushels wheat; 3rd year 2 tons, 1083 pounds clover hay.

The four years rotation is most popular with those who prefer to grow their roughages and purchase part of their concentrated food-stuffs. Commencing with hoed crops which are followed by grain, clover hay and pasture; this rotation has a great many good points and can be strongly recommended. The farm can be divided into the four equal sections of the rotation by two fences that cross in the middle of the farm.

The five year rotation: grain, hoed crops, hay and pasture is probably the one best suited to the average dairy farm. It will supply almost twice the quantity of concentrates per year that could be secured from the four years rotation; thus saving large bills for expensive mill feeds. If the grain after sod be seeded down with clover, a good cut of clover hay the fourth year of the rotation is pactically assurred. This, with corn, roots, and O. P. V. grown from the second year of the rotation will supply a large qquantity of the best roughages, for cows.

Seven Years Rotation

This rotation, frequently known as the P. E. Island rotation, has a few good points; one of the best of these being the long interval between hoed crops, which is the best preventative against such diseases as club root of turnips and certain potato diseases. It starts with grain, then hoed crops, grain, hay and pasture. The four years in sod makes it very tough for breaking, greatly erduces the proportion of clover in the hay crop, and frequently allows the land to be overrun with noxious weeds and moss. I scarcely think this should be called a satisfactory rotation, but many of our farmers are still following it or a slight modification of this rotation.

Cultural Experiments

Previous to starting our soil cultural experiments we staked off the field and recorded the yield of oats from all the plots one year and the yield of barley the following year. A fairly accurate record was also secured of the nature of the crops grown for the previous 13 years was also secured as a working basis. The land which is a sandy loam underlaid by a gravel brick-clay hard pan had to be drained. This was done as uniform as possible except in the area devoted to tile drainage experiments, where we laid the tile at depths varying from 24 inches to 48 inches. So far the drained plots have given greatly increased yields over the undrained averaging 21 bushels and 30 pounds per acre over the check plots in between. We find very little difference, however, between the plots tiled at different depths. In fact, the one with tile 24 inches deep gave a better yield than those at 30 or 36 inches. I expect that this is due to the fact that we have an impervious hard pan at about 18 inches below the surface and that the drainage is over the surface of this to each drain and then a straight drop to the tile.

Another experiment that will interest most men, was one comparing autumn and spring plowing.

HORTICULTURE.

BEES, THEIR VALUE IN THE ORCHARD

(An address by F.W.L. Sladen, Apiarist, Dominion Experimental Farms, at the recent Nova Scotia Fruit Growers' Association.

It is a good sign that the Nova Scotia Fruit Growers' Association has invited a beekeeper to speak on bees, because I can safely predict that before very long the value of honey produced in the province will be as great as that of the fruit produced today. I say this, bearing in mind that honey can be produced very profitably nearly all over the province. But beekeeping in the province is as yet only in its infancy. It looks as if the fruit growers are going to have the honor of taking a leading part in raising this promising infant for the very good reasoon that is the subject of my address today.

The evidence that insect visitors to the blossoms are necessary for the production of apples is strong and convincing. Professor Waite, whose experiments are published in the year book of the United States Department of Agriculture for the year 1896, reported as follows: Out of 2,536 blossoms covered with gauze, only three apples set fruit. The Baldwin, Spitzenburg and the Fameues set some fruit. The Baldwin, which is often self fertilized, gave four times better results when pollinated with a different variety. The cross pollinated apples were larger, more highly colored and better supplied with seeds than those that were self pollinated.

Similar results were obtained at the Experimental Farm at Kentville last year. Uncovered blosoms produced from one hundred to fourn hundred per cent. more fruit than covered blosoms.

The explanation of these results is as follows: Each apple blossom contains the male element consisting of numberless dustlike pollen grains held in the anthers at the tips of the stamens, and the female element, or ovule, of which there are five contained in five ovaries. Each ovary carries a stem or style, ending in a stigma which receives the pollen. In order that the apple pips or seeds, and in practically every case, the apple itself, may develop, the ovules must be fertilized by pollen that has been placed on the stigmas. The pollen grain is caught on the sticky surface of the stigma and throws out a pollen-tube which grows down through the style and after a few days reaches the ovule and fertilizes it.

Several authors assert that if several of the ovules fail to be fertilized the apple will be deformed, and is liable to become a windfall. Most varieties of apples need pollen from a different variety to effect fertilization, or if th evariety is self fertile, the apple is larger and better if the pollen comes from another variety. Among the varietie grown in Nova Scotia, the Nonpariel, Blenheim, Ribston and King of Tompkins are known to be self fertile, while Baldwin and Wealthy are self fertile to some extent.

The pollen of the apple is somewhat adhesive or sticky. It therefore cannot be carried by the wind to any extent. This was demonstrated by Waugh. He exposed sheets of glass covered with vaseline in an orchard in windy weather. An insufficient quantity of pollen collected on these sheets to effect pollination even in warm sunny weather with a direct wind, at a distance equal to that of one tree from another.

The insects visiting fruit blossoms are honey-bees, solitary bees, wasps, flies, flying beetles and ants. The bees and especially the honey-bees, are much better pollenizers than the wasps, flies, etc., because they work regularly from flower to flower to collect the nectar and pollen. They are the regular agent appointed by nature to carry pollen from flower to oower. Their bodies, legs, and tongues are covered with hairs which serve that purpose, and the hairs are frequently branched. The wasps, flies, beetles, etc., are occasional and accidental visitors. They have no regular business at the flowers. They do not work assiduously like the bees. They may alight on a flower and rest there for some time, and then alight on another part of the tree or on the ground. Certain species of social wasps (Vespa) are an exception in that they work like the bee on certain flowers such as Cotoneaster, Rhamnus and Impatiens. These various insects are therefore far lesss useful than the industrious and hairy bee, and of insignificant value in comparison under normal conditions.

I regret to say I have not yet been in Nova Scotia in apple bloom time, so that I cannot say how far the bumble-bees and solitary bees and certain wasps will do the work of fertilizing, but I feel safe in saying that the apple growers of Nova Scotia need honey-bees to do this work more than those of southern Ontario, the Okanagan Valley of British Columbia and New York State for two reasons.

The first and most important reason is that on account of its maritime situation Nova Scotia has a greater rainfall, and especially in parts that are exposed to sea fog, is apt to have less sunshine and lower day temperature to apple bloom time than the other fruit frowing regions. Bees will work well and freely on the blossoms only in gavorable weather. On cold days and in heavy rain they will not work at all. In a season where there are only a few hours of suitable weather for the work of the bees, the bees must be working industriously in large numbers to accomplish pollination. The advantage of the honey-bee is that it winters over in the adult stage in large numbers, 10,000 to 20,000 in the hive, and during the time the apple is in bloom, the population of the hive has increased to 30,000 or 50,000. It takes only five weeks to raise a bee ready for work in the orchard, and breeding begins when the willows start flowering.

Unfavorable weather has also a bad effect on the blossoms. Some recent studies of pollination of plums by Dr. Dorsey at the University of Minnesota show that unfavorable weather at blooming time may completely prevent the setting of fruit. Rain closes the antlers and temporarily locks up the pollen. Further, and this is very important. pollen tube growth is slow, especially in low temperatures, so that unless pollination is done early, fertilization is liable to be missed, because the stigma is receptive for only four to six days. and the style withers eight or twelve days after the blooming. There is no reason to doubt that these conditions are paralleled more or less in the case of apples. and that pollination to be most effective should be done when the buds are opening. This limits the time allowed to the bees for doing their work to a much shorter period than might be supposed and shows how important it is that there should be an abundance of honey-bees to visit the opening buds in their thousands as soon as the weather is favorable.

The other reason Nova Scotia needs honey-bees more than the other principal apple growing areas on this continent is that the number of species of wlid bees in the Annapolis Valley is not nearly so great as in southern Ontario, the Okanagan Valley, New York tate, etc., and I can find no evidence that certain species visiting fruit bloom are particularly abundant or becoming more abundant. However, this is a line in which more investigation should be done, and if any useful species of bumble-bee or solitary bee is inclined to increase, it might be possible to encourage it. I have noticed that bumble-bees are not particularly abundant in the Valley in July and August, not nearly so abundant as in England, which indicates that they must be comparatively scarce in fruit bloom time because the bumble-bee is not like the honey-bee. The bumble-bee colony perishes in the fall, and only the young queen-bees winter over. The queen does not start to lay her eggs until willow bloom is advanced or over, and ten or twelve small workers are all that she can raise at first. This is also true of the social wasps. The numbers of bumble-bees and also of the solitary bees vary very much from year to year in that they are likely to be greatly reduced in some seasons by parasites and

Massey-Harris

Plowing with Power

The Massey-Harris Power-Lift Tractor Plow is the product of a rich experience of over half a Century of Plow Building. Its entire construction is especially rigid and strong to stand the immense strain of Tractor Plowing, and it is fitted with Bottoms specially designed for plowing with power.

Two Levers within easy reach of the operator on the Engine regulate the depth of plowing. By simply pulling a rope the Power Lift operates to raise or lower the Plow as desired. The Hitch has wide range of adjustment both vertical and lateral, and being stiff permits the Plow being backed. When raised all Bottoms are at the same level, the rear being equally as high as the front, namely, 6 inches. A Hardwood Break Pin in the Hitch prevents breakage. The Third Bottom or Plow can be detached to convert a Three-Furrow into a Two-Furrow, or vice versa; it can also be attached to a Two-Furrow, thus making a Three-Furrow Plow.

The Ideal Plowing Outfit—
The Massey-Harris Tractor and Tractor Plow.

enemies, and the Nova Scotia winter is very trying to many of them. The solitary bees do not work so industriously on the blossoms as the honey-bees and the bumble-bees.

In the United States, it has been declared by careful investigators that honey-bees are more valuable for fruit production than for the honey they produce. How much more must this be true in Nova Scotia where the climate is less favorable, and wild bees less numerous. Evidently the presence of honey-bees in Nova Scotia orchards in numbers is highly important to ensure against failure of the apple crop in a season of unfavorable weather.

Escaped swarms that have taken up their abode in hollow trees and between the walls of buildings, etc., have probably helped to maintain the bee population in the fruit growing regions. These, owing to a lack of special protection, would be liable to be exterminated during a hard winter.

The foregoing remarks make it quite clear that the keeping of bees in or near the orchards is necessary to ensure the fruit crop against loss in unfavorable seasons, and is beneficial in all seasons. Bees are entirely beneficial to the orchardist. They cannot do any harm in the orchard except possibly carry fireblight, disease that is, I believe uncommon in Nova cotia, and in which the bee is, at most, an unimportant and accidental agent. Indeed, it has not been proven that honey-bees carry this disease.

The question therefore resolves itself into: How are bees to be kept in the orchards. In studying this question, we are at once confronted with the fact that beekeeping is a specialty that con only be successfully carried on by trained beekeeers. Natural aptitude, years of experience, and sufficient spare time to do the right thing as soon as it is needed are essential for success in beekeeping. We have found that the horticulturist, including the fruit grower, more particularly the grower of small fruits, usually makes a better beekeeper than the herdsman or poultryman, so that probably many fruit growers have the natural inclination and apititude to make good beekeepers, but many others, I fear, have not the time, or think they have not, with present shortage of labor, etc., and it is wasteful and may even become criminal when bee disease is in the district, to keep bees and neglect them. By all means keep bees if you like them and can spare the time to attend to them properly, which, after all, will not be much when you have studied and mastered them. This is the most satisfactory solution of the question.

But to the orchardist who has not the time to attend to them, and I believe there are many in this case, what advice can be given? I believe the best thing he can do is to encourage the trained beekeeer to keep his bees in his orchard. In many caes, no doubt, it would pay the orchardist to furnish the bees and supplies and let the beekeeper have half of the honey for his trouble. Let us look at the proposition from the beekeeper's standpoint. He gets more honey from alsike and white clover than from fruit bloom, and therefore prefers a clover country, but fruit bloom provides valuable feed in spring for breeding bees and in favorable seasons a certain amount of surplus honey, and the orchard provides shelter from wind. One place can support at least fifty colonies of bees, and a good beekeeper can look after one hundred and even two hundred colonies, so that the professional beekeeper could attend to at least two large apiaries. But, for the orchardist, it would be better to have the one hundred hives scattered in ten apiaries of ten hives each. The disadvantages of this plan for the beekeeper are that he would have to travel over much ground, and while he was attending to one of the apiaries swarms might be lost in the other nine. The beekeeper would therefore need good compensation, and an easy and effective method of swarm prevention would be necessary, such as the one we are now investigating at the Experimental Farms of removing the queen at the commencement of the honey flow and destroying all days later. In many cases the difficulty of the absent beekeeper might be overcome by a young member of the fruit grower's family, or perhaps his wife, keeping the bees, and he or she could find them an interesting queen-cell except one eight or nine and profitable pursuit. The Annapolis Valley is a good place for honey production. Besides fruit bloom and clover, the wild radish is a valuable honey plant and the fall honey producing weeds, the goldenrods, asters and fall dandelion are more productive than in Ontario. At Kentville, the Experimental Farm bees have always done well ,and Nappan for a time gave the highest yield per colony of any of the Experimental Farms in aCnada, and still stands high. The benefit to the apple crop with a honey crop thrown in makes beekeeping the most profitable sideline the fruit grower can engage in.

It is important that those who keep bees should keep them well for two reaons: First, neglected bees cause the spread of the destructive brood diseases of bees, American and European foul-brood. American foul-brood has already appeared in the Cornwallis Valley, and will cause great loss if neglected. Second, wintering. The Nova Scotia wintering is particularly trying on neglected bees, the winter mortality of bees being evry high, especially in long and hard winters. You cannot keep bees by leaving them alone. You must have them on on movable combs and examine these combs periodically, and have sufficient knowledge of bees to, at the examination, correct any wrong conditions that may have developed and provide for the bees' needs until the next examination is due.

The scarcity of bees in the Valley today is attributed to the exceptionally long and hard winter in 1917-18, which killed nearly all. But severe winters will come again, and the only way to ensure against loss is to prepare the bees properly for winter. The principal thing is to give adequate protection. Have your apiary in a place sheltered from wind, and put the hives in a case, preferably large neough to take four back to back, with a space for three or four inches of shavings, chaff or other packing material containing an abundance of small dead air spaces between the hives and the case both at the ides and below, and eight or nine inches on top, with the entrance reduced in fall and winter to say ⅜ of an inch wide by one inch high. See that the colonies are strong, have good young queens, and plenty of wholesome stores. It is well to use the 10-frame Langstroth hive because then most of the fall honey, some of which may not be very wholesome for wintering, will be put in the supers, and the bees should be given in September ten to twenty pounds of wholesome syrup made form granulated sugar or combs of clover honey to bring the weight of stores up to forty pounds. The employment of cases can be avoided by putting the bees into a dry and well insulated cellar where the temperature remains between 42° and 50° throughout the winter. It is a common practice in the Valley to winter the bees outside without any added protection except perhap spruce branches. This is entirely insufficient protection, and the fact that colonies so treated sometimes pull through is simply due to a fortunate combination of circumstances which can never be depended upon.

Bees will travel several miles from the hive in fine warm weather in search of food, but they will not work to profit at a distance of over one, or in exceptional cases, two miles. But in the cool weather of the spring, and especially in a season of broken weather when they are most needed for pollinizing fruit bloom, they cannot be relied upon to work at these distances, and I should estimate the limit of their effective range at a half a mile or even a quarter of a mile. Their abundance at the fruit blossoms would of course depend on the amount of bloom, and on the number of colonies. Also some of the bees might be diverted to other flower that are out at the same time as fruit bloom such as blueberry. At Ottawa, dandelions are out in great numbers during fruit bloom, and are very attractive to the bees, but the dandelion secretes sufficient nectar

(Continued on page 394)

Eureka Potato Planter

Pays for Itself in Labor and Time Saved

One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.

Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. **Furrow opens and seed drops in plain sight**—an equal distance apart, at uniform depth, with **absolutely no injury to seed.** Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.

Write for **free** catalog on this great line of potato planters—the largest line made. Sizes for 1 or 2 rows, with or without fertilizer attachment. **In Stock Near You.** A success for over 20 years. Whether you are a large or small grower—**write today.**

DAIRYING.

THE CENTRAL NOVA SCOTIA MILK PRODUCERS' ASSOCIATION

The above organization, which was born a few weeks ago, has rapidly developed into maturity, and held its first "of age" meeting on Monday, Feb. 2nd, with the Persident, Mr. H. L. Taggart in the Chair. The meeting was held in the Assembly Hall of the College at Truro, and was a large and thoroughly live one.

Addresses were given by Mr. H. R. Brown and Dr. Cumming, both very interesting and instructive talks, but the main interest of the day centralized about the resolutions which are given below. A lively discussion arose over (f), which calls for a survey with the object of ascertaining the cost of producing milk under present condi tions.

The general trend of the discussion was to the effect that the farmer at present prices was being but poorly paid for his outlay in capital and labour. Mr. C. P. Blanchard of Bible Hill, a well known breeder of Dairy stock, claimed that a reasonably good cow, if well attended, will at present prices net her owner $100 a year, and warned the Association against demanding more than a fair price. Milk is the great children's food, and higher prices would mean the shortening of the supply for those who need it most.

The resolutions follow:—

RESOLUTIONS

(a) THAT: Constitution and By-laws be published in pamphlet form, for distribution among the members.

(b) Subscriptions to "The Dairyman's League News" be furnished for each Director; the subscription to be paid from Association funds.

(c) THAT: the Central Nova Scotia Milk Producers' Association be affiliated with the Nova Scotia Dairymen's Association and through it with the National Dairy Council of Canada, and that a delegate be elected each year to attend the annual convention of the Nova Scotia Dairymen's Association.

(d) THAT: we get further information re the price of milk to other associations.

(e) THAT: we get all the information possible re cost of production.

(f) THAT: we urge the Department of Agriculture for Nova Scotia to conduct a farm survey or investigation, under the direction of the Dairy Superintendent, with the idea of securing information re cost of production by the farmer. Results of survey to be available to each member.

(g) THAT: a committee be appointed for the purpose of obtaining or selecting some literature for distribution among members with the idea of education along lines of better care of milk in handling and transportation, better cows and better feeding methods, in order to get greater and more economical production.

(h) THAT: a series of meetings be held in different places through our Association, to be addressed by some of the leaders in agricultural thought and practice; the program to be arranged by a special committee; and that as far as possible, the local district Associations be made the center of some social activities in their neighbourhood by securing the co-operation of the farmers' wives and families, having social evenings, with perhaps lunch and program, or short addresses on some current topic or a moving picture program showing the latest in farming operations, etc.

(i) THAT: a farmers' picnic be held some time during the summer; the time and place to be arranged by the Directors. And, that a banquet be held annually in Truro at or near the time of our annual meeting; invitations to be sent to some men who will give inspiring addresses, also to officers and members of other Associations who may be helpful to us.

(j) THAT: we make an arrangement with the Borden Milk Co., for the purchase of feed used by the members of the Association.

(k) THAT: the Directors meet as soon as possible after this meeting to determine the best method for getting at a fair price for milk, and that they appoint a committee to meet with the Borden Co., the retailers and other purchasers of whole milk in the district covered by our Association, relative to the prices set by our Association.

(l) Believing that the prosperity of our members depends as much on increased and cheaper production, which largely means better cows, we would recommend that some sort of a competition be inaugurated as an incentive to that end, i.e., by the giving of cash prizes and diplomas to farms, for, say, largest production per cow per year, figuring the same on the total weight and percentage as paid for by the Borden Co. Therefor be it resolved, that, a committee be appointed to work out some such competition, and solicit at least part of the prize money from the Banks, the Borden Co., or others interested in increased production and the general prosperity of the country, to report at the next annual meeting, when the scheme may be finally adopted, competition to start at the first of January, 1921.

(m) We would suggest as a motto for our Association the word CO-OPERATION. We believe co-operation to be the greatest secret to success in all lines, but much more so in our business. That we go on record as holding to the principles of co-operation, both within our Association and between our Association and those who buy our products. CO-OPERATION rather than COERCION, although, if we deem it necessary to coerce, we will be in a position to do so, and will. Therefor be it resolved that we adopt the word CO-OPERATION as our motto, and that this word be printed at the top of our letter head as the motto of our Association.

AYRSHIRE CHAMPIONS FOR 1919

The following are the Ayrshire cows scoring the highest points in their respective classes in the R. O. P. for 1919. The first one mentioned in each Class being the silver cup winner.

"This nation depends more on dairy foods for its physical welfare than any other foods, and the dairy farmer truly performs a tremendous service in the production of such foods."

—P. M. SHARPLES

"There are no substitutes for dairy foods."

There is a cream separator expert in your neighborhood—

the SHARPLES dealer

HIS advice on modern dairy equipment can mean a lot to you. He stands ready to help the farmer, and his sound judgment on farm and dairy equipment can be relied upon — proved by the fact that he sells the Sharples Suction-feed Cream Separator.

He has elected to sell the Sharples only after a careful study of all cream separators. He has proved to his own satisfaction that the Sharples *"does"* skim clean at any speed." He will gladly demonstrate that fact to you.

The Sharples Suction-feed has other exclusive features; simple, one-piece bowl (no discs), knee-low supply tank, automatic once-a-month oiling system, simple construction that means longer wear. Let the Sharples dealer in your neighborhood show you how these features (found on *no other separator*) will increase *your* dairy profits.

DEVELOPING THE DAIRY INDUSTRY OF NEW BRUNSWICK

The Dairy Industry of New Brunswick has shown considerable advancement during the past two years. The improvement in the quality of products, both butter and cheese, is especially worthy of mention. The recent Dominion Butter Scoring Competition was an indication that some of the New Brunswick creameries are putting out a product of high quality and one that compares quite favorably with other provinces. Cheese buyers also express themselves as well satisfied with the output of New Brunswick's factories at the present time.

and are now offered for sale to all who are interested in improved and up-to-date methods of handling dairy products, and it is hoped this stock will be taken up by the milk producers, as the business is to be carried on co-operatively by and for the farmers.

A suitable site has been purchased and it is expected the Company will be in a position in the early spring to receive cream by rail and steamer from any shipping point on all lines coming into Fredericton.

Assistance from the Department of Agriculture

To show that they have confidence in the success of the business and feeling that it is in the best interests of both producer and consumer, the Provincial Department of Agriculture will guarantee interest at the rate of six per cent. per annum upon the paid up capital until the business grows sufficiently to meet all legitimate operating charges and interest upon the paid up capital at the aforementioned rate, but this guarantee will not extend for a longer period than five years from date of incorporation.

Results in Other Places

The largest and most successful creameries in Canada are those operated on the cream gathering system, because an extensive territory is served, a large output is ensured and the operating expenses are correspondingly low, thus giving the farmer a better return for his cream.

The following summary of the business done at the Farmers' Co-operative Creamery, Limited, Moncton, N. B., serving the districts within a radius of eighty miles of Moncton, will show the development that is taking place and the returns producers are receiving for their cream.

SUMMARY OF BUSINESS FROM DATE OF OPENING JUNE 5th, 1918 TO DEC. 31st, 1919

Month 1918	No. Patrons	Lbs. Cream Received	Lbs. Butter Mfg.	Paid for Butter Fat	Total Cash Paid Patrons

Nov.	221	36,267	10,845	68c.	6,394.14
Dec.	166	32,722	10,237	72c.	5,922.62

The Cooperative Creameries of the Province are meeting with considerable success. The Department of Agriculture are encouraging the establishment of Central Cooperative Creameries in different parts of the Province, in order that the farmers in every district may have a free outlet for their milk and cream.

The Creamery established in Moncton two years ago is rapidly assuming the leading place in the quantity of butter manufactured, as compared with any Creamery in the Maritime Provinces. Over 300,000 lbs. of butter was made at this Creamery last year.

Proposal for a Cream Gathered Creamery

Realizing that dairying offers good inducements to the farmer who goes into it in a business-like manner, with a determination to improve and build up a good dairy herd, by weeding out unprofitable cows and by more careful breeding and better feeding, and knowing that it will insure a profitable monetary return upon the invested capital and labour, and at the same time conserve and build up the fertility of the farm better than any other system of farming, and also in view of the fact that the home dairy does not offer the same stimulus to the business as the manufacturing and marketing of dairy products co-operatively, a number of farmers in the vicinity of Fredericton met recently in the office of the Minister of Agriculture to consider the advisability of starting on co-operation dairy business in Fredericton to serve the farmers in the Counties of York, Sunbury and Queens, who are not now having their dairy products handled co-operatively.

After hearing reports and examining statements of results attained in other parts of the Provinces it was unanimously decided that it would be in the best interests of the farmers to organize and operate a central creamery in Fredericton, for the handling of the milk products from the above counties.

The Proposition

A Joint Stock Company has been organized, to be known as the Farmers' Co-operative Dairy Company, Limited, with an authorized capital of twenty-five thousand dollars ($25,000.00), divided into one thousand (1,000) shares of twenty-five dollars ($25.00) each,

Fredericton as a Centre

With the railway and steamer connections centering in Fredericton, practically every point in York, Sunburp and Queens Counties can be served, and dairy experts familiar with the outlying districts agree that a better centre for a business of this kind cannot be found in the Maritime Provinces; and again, the demand for pure milk and cream, high grade fresh made creamery butter, buttermilk and ice cream in Fredericton and its adjoining suburbs is an advantage that many of the successful creameries now in operation do not enjoy.

Farmers' Co-operative Dairy Co., Ltd.,
Fredericton, N. B.

DE LAVAL
Separator Savings

De Laval users are on the profit side

No machine used on the farm returns a larger profit on the investment than a De Laval Cream Separator.

It saves from 25% to 50% of cream twice a day every day in the year over crocks and pans; and from 10% to 25% of cream over an inferior or half-worn-out separator.

With butter-fat at the present high prices these savings mount rapidly. Many thousands of users have found that their De Lavals paid for themselves in a few months. De Laval users are always on the profit side of the ledger at the end of the year.

More De Lavals are used than all other makes combined.

Your local De Laval agent will be glad to demonstrate what an Improved De Laval will save you. If you don't know the nearest agent, please simply write the nearest office below

HEAVES IN HORSES

Is bran mash given twice a day good for heaves? I have a mare that is showing signs of having this trouble. Can anything be done to cure her?

Reply: The immediate cause of heaves is rupture of the small cells in the lungs, so that the animal cannot expel the air drawn into the lungs without extra effort. This rupture is generally brought about by putting the horse to hard work with his stomach full of ocarse, undigested food. It is also hereditary, and horses and mares so affected should not be bred. A cure is impossible, but great relief may be had by feeding the horse on light, nutritious food in moderate quantities and by improving digestion by tonics. A purgative should occasionally be given to keep the biwels regular. A bran mash once a day will be useful, but will not cure heaves. A good preparation to help is found in one ounce of Fowler's Solution of Arsenic, given each morning for a month or so.

COWS GIVE MORE MILK and are in better health when given

LIVE STOCK.

IMPROVED LIVE STOCK MEANS LARGER PROFITS

A large class of progressive farme s appreciate already the value of pure-bred live stock. They have settled the question for themselves in the affirmative. They would not think of returning to the old days in which they kept cattle of no especial breeding. But the question is, should the average man on the farm get rid of his scrub cattle and put pure-bred animals in their places?

Were we to consult him about it and tell him of the success of the breeders of pure-bred live stock he would respond that this man has plenty of money. He is able to purchase cattle for the foundation of his pure-bred herd. He has money with which to supply the necessary equipment and to provide the proper care and purchase the necessary labor involved in the management of a pure-bred herd of a high order. But, says the average farmer, "we have no money with which to purchase pure-bred cattle, few of us have silos, our barns are poor and inadequate for the needs of such a herd, and so, we must just scrub along from year to year as we have been doing. We have gotten a living up to now and I guess we shall continue to do so if the prices of farm products continue where they are."

Pure Bred Cattle Best

But is this man right? Can the average farmer afford to retain his ordinary cows when the added advantage of a pure-bred herd is considered? Do the facts of scarcity of money and poor and limited equipment justify him in such a course, and once again, is the average farmer fitted to breed and manage a pure-bred herd? If not, may he be taught to do so successfully?

There is no longer any question of the superiority of pure-bred cattle over those of no especial breeding. Ample data has been secured to prove this fact beyond any possible doubt and an ever-increasing number of people are becoming conscious of it. The time was when we had to argus this question, the objector would say, "there are many pure-bred cattle that are nit worth keeping." He was right, and such a statement would be true even to-day. But there always has been, and there always will be a much larger number of scrub cattle that do not pay for their feed and care. The scrub cow has neither pride in ancestry nor hope in posterity. We have no right when we consider a scrub heifer to form any opinion about her performance when she reaches maturity. She may be the daughter of an excellent cow and yet when she comes into milk she may not pay for half she eats. She may come from only an ordinary mother and may develop into a better cow herself, or on the other hand, she may be even poorer than the mother that gave her birth. There is absolutely no way to tell anything about it. Hereditary tendencies are so crossed and twisted in the average scrub as to destroy each other to an extent that makes improvement along these lines even under the best methods of handling a very discouraging task.

If the pure-bred sire of splendid breeding be introduced into a herd of scrubs great improvement will result, in fact this is where the improvement in most cases should logically begin, because pure-bred cattle of merit are scarce and expensive and the average farmer with a little money must begin the work of improvement with the smallest possible outlay of cash. But every dairyman, every man who wishes to develop a herd of beef cattle or to keep live stock for any purpose should construct a breeders' ideal at the beginning. He may have to begin with simply the pure-bred sire, but if possible he should own one or two registered females, and he should be very careful indeed about these pure-bred heifers or cows that he purchases in the beginning.

The danger is that the man of small means will look for purebred animals purchasable at a price that he feels he can pay. And the anxiety to find something cheap will obscure his vision of what a pure-bred animal really should be if it is to be made the foundation of a future herd.

Breed Them Alike

The importance of standardizing our live stock is rapidly growing in the public mind. It can be accomplished most easily and in the least possible time through the farm bureau movement and what we have to say about it in the remainder of this article will be said in connection with that agency. The county agent will appoint a leader in matters of live stock improvement in every community in the county where the interest will justify such action. The next move will be to establish a uniformity of breeds. It is not necessary that a whole county should unite upon one breed of cattle, but it is desirable to do so always if the people can be made to see alike. On the other hand, it is entirely impossible to accomplish large things in breeding where too many breeds are kept. If all purebred animals were of equal merit it would not matter, but this is far from being true. The very next move after we have established our breed is to begin the weeding out of the poor animals and to discover the individuals of real merit. These two lines of effort must continue just as long as we are in the business if we are going to succeed. If but one man in a community breeds a certain breed of cattle he may continue for years without the discovery of a single animal of unusual merit, but if ten men have united upon a single breed someone is bound sooner or later to discover animals of great value. What is of still more importance, characteristics will have been discovered that will assist in classifying families of merit in the breed and the blood of these good cattle will in a short time diffuse itself throughout the entire community. This is a most telling, and indeed, an unanswerable argument for standardization and for community breeding.

PEERLESS
THE ALL AROUND
FENCE
PEERLESS PERFECTION
Strong enough to keep your own live stock where they belong and your neighbor's out. The best way to hold neighborly friendships is to fence to prevent trespassing. This fence "locks the bars," "stays put." Made of Open Hearth steel wire—heavily galvanized
in such a thorough manner that it will not flake, chip or peel off. The wires are tough, elastic and springy and will not snap or break under sudden shocks or quick atmospheric changes. The joints are securely held with the "Peerless Lock," which will successfully withstand shocks and strains and yet it can be erected on the most hilly and uneven ground without buckling, snapping or kinking. We also build a full line of poultry fence, ornamental fence and gates. Write for our literature. Valuable information on fence construction.

President N. B. F. & D. A.,
Havelock, N. B.

The County Agent Can Help

The county agent through his live stock man can begin his work in practically every progressive community. Such action lies at the beginning of all true progress in live stock improvement. With the community organized to breed a particular breed let us turn our attention now to these men of small means and poor equipment. They have read farm papers for years, they have attended dairy meetings and farmers' institutes, and from these sources they have gotten much good, but up to now they have lacked the human touch that the farm bureau movement brings to them. But some afternoon during the winter the country agent mects the live stock man and his neighbors and heart to heart they talk matters over. These men with no silos find out how they can obtain them at least cost and resolve to do so. A breeders' association is formed and splendid sires are purchased under the advice of the county agent and almost before they know it these people are on the way with rapid strides toward live stock improvement. Some good purebred heifers are located and purchased by the more prosperous farmer of the community and one or two men of small means borrow the money and invest it in purebred heifers and thus the community gets a start.

Problems of equipment and food are discussed from time to time and the community idea grows always under the watchful care of this new superintendent of agriculture, the county agent. By and by a cow-testing association is formed. It is then that the weeding process begins in earnest. No one interested in live stock improvement can read the history of these associations without ever-increasing enthusiasm. The writer has never known an instance where a cow-testing association ran for three consecutive years and butter-fat production did not increase by leaps and bounds. Such increase is simply the logical result of this movement. The gathering of definite facts on a particular dairy is certain to bring about more economical production.

Working Up in the Game

Every farmer who keeps live stock at all should look forward to the day in which he shall be the owner of a pure-bred herd. In brief, this is the programme—first the county agent, next the organization of the community to this end, then the introduction of the pure-bred sire of the one breed agreed upon, followed by the purchase of as many pure-bred heifers as can be purchased under the circumstances. Community meetings in which to consider local problems unite the individuals in a common vision and a common purpose, then by and by the cow-testing association accomplishes the weeding out of undesirable animals and retention of those of real merit.

Such a course will make practically every farmer in the community who keeps cows a breeder of pure-bred animals in time. Who can estimate the value of such a programme to a rural community?

What may it not mean in the progress of soil improvement, in added home comforts and conveniences in rural homes? In better education privileges for country boys and girls, in adequate rural social centres for young and old, in the reviving of the rural church, and in short, in all lines of desirable improvement out in the open country. Again we ask, who can measure the advantages of such a programme? These are possible because improved live stock means largely increased profits on one hand, and on the other that marvellous intellectual and ethical growth which always comes to individuals singularly or collectively when they catch a new and splendid vision, form a great purpose and then devote their muscle, their minds, and their hearts to its accomplishment.

STOCK NOTES

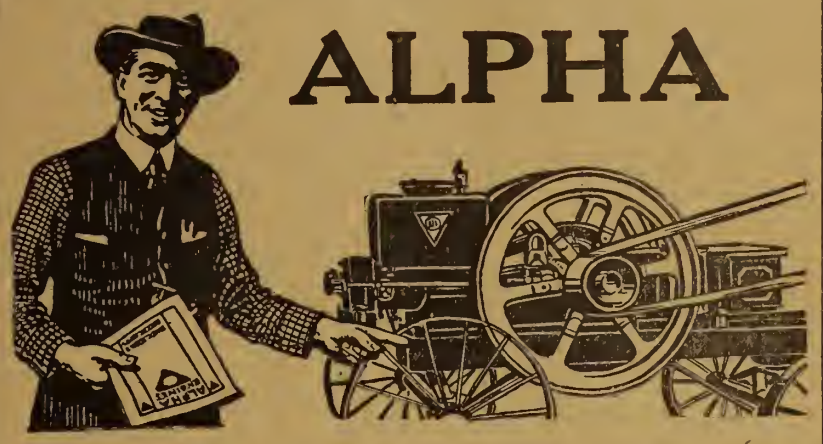
Harding Bros., Holstein Breeders, write:—

The young bulls mentioned in our ad. are an extra choice bunch, and will be priced right to sell in the next 30 days as we are in need of more room, to accommodate our ever increasing herd. We have had the best year, from a sales' standpoint, of any year since we started breeding Holsteins in 1905. To-day we have the most promising lot of heifers coming on we ever owned, all sired by Sir Fafroit Shcuiling, which was without a doubt the best individual bull ever bred in the Maritime Provinces. He has been repeatedly shown from Ottawa to Halifax, and has been grand champion almost where ever shown. He is a big massive fellow with an abundance of dairy quality and tips the scales, when in show shape, at almost 2700 lbs. He was used in his younger days in the herd of Wm. S. Harding, of Hammond River, who has a number of his daughters in milk with first calf, that on twice a day milking, gave over 60 lbs. of milk a day, as Sr. yearlings. They are also good testers, and all that anyone could ask for in point of type.

Now, we have bought to follow, on the daughters of Sir Faforit Schuiling, Sir Johanna Ormsby of Hickory, bred for long distance production on all his ancestry lines. He is without a doubt one of the best yearly record backed bulls in the Maritime Provinces. His dam has the good record of 22,159 lbs. milk and 971.25 lbs of butter in 365 days. She is a grand, large cow, fit to go into any show and win, and her Sire, Johanna Rue 4th's Lad, has 31 tested daughters and 18 proven sons. We believe this grand old bull has more large yearly record daughters and sons with large yearly record daughters, than any other bull in Canada. Now just a word for Sir Johanna Ormsby of Hickory, as you will see by his picture on another page of this issue, he is not only backed up by large production, but he is a bull of splendid type and is a large fellow, that would take a much better picture today than when he stood for the last. He tips the scales at almost 2500 lbs. He was used for a while as a junior herd sire at the Central Experimental Farm at Ottawa, and was then sent down to the Experimental Farm at Fredericton, where he was when Harding Bros. purchased him last spring. In the next issue of the Maritime Farmer we will tell you something about some of our cows and a few of our recent sales.

More years of service and lowest fuel cost when using an

ALPHA



The Alpha is the cheapest gas engine in the long run, because it gives many years of good service, with low fuel bills.

It is used by thousands of Canadian farmers, who appreciate its economy and dependability. They buy from a local De Laval agent because of the service he renders his customers.

Before putting any money in a gas engine investigate the Alpha —and remember that the man who buys the best is never sorry.

The Alpha is made in twelve sizes, 1½ to 28 H. P., and in several styles.

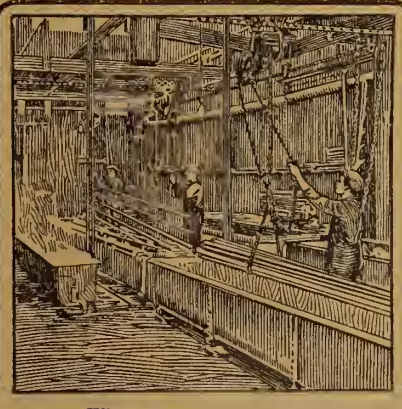
There are two sides to most questions. The broadmined person recognizes this fact and is willing to hear the argument of the other side with the same patience he wants the other fellow to hear his side.

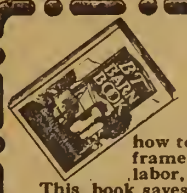
Size is not an indication of the probable value of the cow as a producer, but is many times taken as such an indication by the inexperienced. Color is only a breed index and is of consideration only in that light.

1. When you put equipment in your stable you want it to last. A big advantage of Steel Stalls is their durability. But if steel is not properly protected it rusts. There is only one way to protect Steel Stable Equipment thoroughly, and that is to galvanise it, All BT Steel Stalls are galvanized.

2. We have our own galvanizing plant for this purpose. The rust-resisting coat of zinc is united Chemically and Electrically with the steel. Before this is done all impurities are removed from the surface of the Steel by a strong acid bath and careful scrubbing. Neither damp nor Stable Acids affect BT Stables.



3. When you put in BT Equipment, you put in stalls that will last a lifetime. We do not charge extra for galvanizing our stalls. Our large output and labor saving machinery enable us to galvanize every piece of tubing, post and clamp which goes into BT Stalls without charge.



Send this coupon for the 352-page Barn Book. Tells how to plan and build the barn, how to ventilate, how to frame, how to save steps, labor, time and feed. This book saves you hundreds of dollars in building. It is free.

WINTER CARE OF FARM MACHINERY AND HARNESS

How few farmers stop to consider the fact that it is while farm machinery, implements, and harness are idle that the tear and wear, and loss through depreciation mounts the highest. From observation of the general usage given by farmers to the equipment that lies idle throughout the winter, it is evident that many do not realize the truth that it is in the multitude of little things neglected that spells failure, and the careful and intelligent attention to detail that insures success. From attention to small details comes most of the profit not only on the farm but from every business everywhere. The man who studies his business down to the minutest detail, wastes less energy and succeeds easier. He is the farmer who has his work done in season, and in best manner. His farm equipment is ready for use when needed because it has been cleaned up, carefully examined and repaired in advance, and kept under cover where it has not deteriorated. Such machinery and general implements of husbandry will not only last longer but will do better execution when in use.

Winter Care of Machinery

During the winter months all farm machinery, that is used on the field in summer and fall should be relegated to some building or under some covering, to keep them free from climatic tear and wear. All farm machinery should be given a thorough inspection before it is put away for the winter. All broken parts should be noted and repairs ordered now so there will be no delay when the machine is needed again. All bearings and working parts should be well cleaned and then oiled or greased to prevent rusting. Where painting is necessary, all the smears from the oiled bearings should be cleaned off the surface of the parts to be painted. All lose bolts should be drawn tight and minor repairs made at once.

With an implement house or shed for machinery, the off days for farm work in winter can be well spent in repair work, and the saving in the life of farm implements and machinery will pay for the outlay in providing the permanent shelter. A little care at this season will do away with a great deal of trouble next spring.

Storing the Commonplace Implements

Many farmers are of the opinion that plows, harrows, and similar commonplace implements do not require any particular care. This opinion is generated from the fact that these implements of husbandry are to be found during the winter months under snowdrifts on the headlands or by the fence-side. A plow that is left on the headland or under snow all winter will accumulate a deep coating of rust on the mould board and shares. A plow in this condition will waste a lot of gasoline or animal power before it gets into a normal working condition again. The plowing season will almost be finished before the fine smooth polish of the new implement is secured, and instead of having a smooth working plow all the time, there is only a short period at the finish of the plowing season that it works with ease and economy. Inside winter quarters and the parts coated with grease that have been burnished by contact with the soil is the only way to keep the plows in business shape.

Harness Economy

A little effort in the winter time in dressing up the farm harness will also save a whole lot of time in a busier season. It is a common belief that farmers have a lot of idle time during the six months of apparent inactivity on the field, but to exercise the necessary economy in these days farmers have no idle time. There is always an inside job and the harness room can take care of the many spare hours.

There are too few proper places in stables in which to keep harness, and consequently there is great waste. Nowadays a new set of work harness costs like sixty, and anything that keeps down the buying bill should be welcomed. A harness room where all the harness could be kept, or a large cupboard for each team's harness equipment, would not cost half as much as renewing harness does.

When leather is exposed to the damp air caused by the breath of animals and bad ventilation, or the ammonia rising from the manure, it rapidly gets hard and brittle, breaking whes extra strain is put on it. With such harness it is not safe to start out upon the road with a heavy load. Buckles become rusted and snaps are easily broken, and when a leather strap is being adjusted to a buckle to meet some change in the hitch, it

NEPONSET PAROID enjoys a national reputation, and is acknowledged to be the best ready roofing on the market. To use Neponset Paroid is to have a guarantee that your roof is water and weather proof, is fire-resisting, will give you long service, and be economical in upkeep.

NEPONSET PAROID

is adapted to every kind of roofing job, whether large or small, and gives the same excellent service if used on a small shed, or for roofing the largest industrial plant.

The base of Neponset Paroid is a high-grade rag felt thoroughly impregnated with asphalt, making it positively water-proof and fire-resisting.

It is further reinforced with a talc surface, grey in color; or with a permanent slate surface, red or green in color.

Easy to lay — With every roll of Neponset Paroid is supplied sufficient nails and cement with full directions.

There is a Neponset dealer in your district. Write us for his name and a copy of our illustrated booklet "Roofing Canada."

breaks off in the hand like a piece of glass. Much of this condition is aggravated by the fact that the sweat of the sumer heat from the horses is often allowed to soak into the harness.

Cleaning and Oiling

Before harness is laid aside it should be all taken apart and washed in warm water in which has been added some soda. While in the water it should be brushed clean witr a stiff brush. When clean and dry, oil it thoroughly. It will require two applications to perfect the job. Also it will require to be the best oil for the wor—either Neat's foot or seal oil. Remember any sort of oil will not do. Oil is oil, but all are not leather lubricants. Linseed and cotton seed oil as well as many of the machinery oils will do the leather little good. To the second application of oil, add some lampblack and finish by rubbing it in with a rag.

While washing and oiling the harness, be on the outlook for weak and broken parts. Take an invoice of these lame parts, and the next time you visit the harness maker get the needed straps and buckles. Harness well cared for proves comfortable to the horses and saves them many cuts and bruises and loss of power and a strap in time, a snap in time and a rivet here and there, keeps them in good trim for hard service.

AZOTURIA—HOLIDAY DISEASE

A vacation from work for a horse that has been in heavy duty may cost him his life if his owner is not careful about the feed he gives. Azoturia is really a disease of the liver and blood-forming functions of the body, but because of some of the symptoms seen, many believe it a disease of the kidneys.

In spite of years of study and much investigation, the exact cause of azoturia is not known, but we do know how to prevent it. At one time it was thought to be due to infection with germ life, but this is not now believed by the best informed authorities.

Symptoms Are Many

In its mildest forms it may appear only as a lameness in one limb from no known cause. As a rule there is a dusky brown color of the membranes of eyes and nose. The worse forms come on after one or two days of rest from the usual labor on a full ration when the animal is taken out and started at his usual work. He usually leaves the stable full of vim and life, but soon appears dull with a heaving flank, dilated nostril and a profuse sweat accompanied with a trembling body.

Often his haunch and loin muscles are swolle nad rigid, he crouches behind and if urged onward will soon fall. When down he may show conculsive movement of legs and body. It may end fatally in a few hours or days or if the animal lives he may show a wasting away of the croup muscles nd be unable to stand.

Success in treating these cases is very dependent in recognizing the trouble early and stopping the animal's exertions at once before the symptoms become well marked. Absolute rest for a time accompanied by laxative feeds such as bran mashes, plenty of water and sweet spirits of nitre to increase the activity of the kidneys are goid treatment. In some cases bromides or other sedatives to enforce quiet are beneficial. Hot packs over the loins have advantages in encouraging the kidneys to eliminate the waste products that are poisoning the system as well as tending to relax the body generally.

Call a Veterinarian

If a veterinarian is available call him early and he will pass a catheter and remove the blood stained urine that is always present in the bladder. There may be other symptoms develop as the case progresses that only a trained veterinarian wil be able to handle, but the careful attendant will assist greatly in keeping the patient quiet, feeding lightly and only on laxatime foods and allowing him plenty of water at all times.

It may be necessary for those unable to stand to be turned occasionally to prevent bed sores. When able to stand he should be assisted to his feet. Massage of the muscles of the limbs and back are of great assistance in restoring circulation and preventing later paralysis.

Prevention Possible

While the true cause of azoturia is not known, it is no doubt due to the collection during idleness of a large amount of nutritive substances in the liver which are too suddenly returned to the circulation as the animal resumes exercise. We believe this because animals at regular work never suffer the disease; secondly, it is so often seen early in the resumption of work after a holiday that stablemen often call it "Monday morning disease" and "holiday disease," and lastly, it will not occur in an animal that has his diet markedly cut down when his work stops, or if he is turned to pasture or exercise paddock during the holiday that he may exercise encugh to keep his liver from loading up.

Finally, then, remember that the feeder can prevent all cases of this disease from occurring if he will cut the feed, especially the concentrates such as oats and corn, during the holiday, or, better yet, turn the animal out for some exercise each day during his idleness, as well as cutting down the feed some.

QUALITY - APPEARANCE - DURABILITY

GOOD-LOOKING farm fields are worthy of a good-looking wire fence to enclose them—but good appearance is not sufficient. With property values so high and good stock so valuable the wise farmer asks for

Invincible Fencing

made from

OPEN HEARTH STEEL

because they get a quality of steel that is uniform, strong, and tough, well galvanized, and because of its uniformity retains its coat of galvanizing.

Made entirely in our own plants, every operation under careful inspection, means a permanent and safe investment to you.

Invincible fencing and gates are sold by the best class of dealers all over Canada.

THE STEEL COMPANY OF CANADA LIMITED MONTREAL

COLT LAME IN THE STIFLE JOINT

(1). I have a two-year-old colt that is lame at times. If I let him out into the yard for exercise the lameness will come on suddenly, and one hind leg will get so stiff that he has to drag it along when trying to walk. These turns come at intervals of one week. Will the colt get better if I keep him in the stable?

(2). Another colt, four-years-old, is all broken out in little lumps all along his neck and on his breast. When they break they leave a very bad sore. When they dry up they break out again at some other place. Will it hurt the colt to work him? What is the matter and how can these colts be treated? C. M.

(1). The sudden lameness of your colt is due to a weak stifle, which gets out of joint when the colt takes some sudden side movement. There is very little hope for a permanent cure, even with a young colt. The best thing to do is to keep him in a box stall, and blister the stifle, with Powdered Cantharides one part and lard heated to boiling point, 12 parts. Mix well together and cool before applying. This is the best blistering to use to leave the least mark. After the blister has been well rubbed in tie the colt's head so that he cannot bite the plare with his mouth, as this will spread the blistering to that part. When the blistering is about healed repeat the operation for three or four times.

(2). This horse is suffering from eczema. Nearly always this disease is confounded with mange, which it closely resembles in appearance; but it differs from it in two important particulars, first, that it is not contagious, and secondly, that it is not caused by an insect.

The most effectual internal remedy is Fowler's solution of arsenic, one ounce, once or twice a day. Continue for a week or so then stop for a day or two, and then repeat the dose, twice a day, for another week.

For the treatment of the eruptions it is necessary to remove the crusts or scabs, by first soaking the parts with sweet oil for a few hours, then washing with soap and water. If the hair is long, it must be clipped, and all dust and dirt removed. Then the whole of the diseased surface and a large space of the healthy skin around, should be covered with the following: Flour of sulphur, half a pound; carbonate of potash, one-four pound; carbolic acid, one ounce; lard, olive oil, each two lbs. Mix thoroughly with the aid of gentle heat. This should be left on the skin two or three days, and then washed off with strong soap and water.

HORSES WITH ITCHY MANES

My horses seem to rub out their manes and tails. I though this might be caused by some kind of an itch. Can you advise me in this matter? J. M.

Reply: Prepare an ointment of equal parts by bulk of vaseline and sulphur adding about 5 per cent. carbolic acid. Mix thoroughly. Wash the mane and tail well with soap and water and when dry, rub in the ointment. Repeat the ointment in three days.

POULTRY.

VALUE OF EGG LAYING CONTEST

(Experimetnal Farms Note.)

There is at the present time a great wave of enthusiasm in poultry production sweeping over practically the whole world, and particularly the English-speaking world. Undoubtedly the necessity for increased production of all foods has been a great factor in this awakened interest, but before this necessity arose the wave had begun, so that it but increased rather than started it.

While there are a great many factors more or less responsible for the awakened interest, the greatest of all has undoubtedly been Laying Contests.

The primary value of Laying Contests undoubtedly was the advertising and stimulus they gave to the breeders who entered their flocks, but the greatest value to the poultry industry was and is the public attention that they have attracted to the production end of poultry keeping and the establishing of confidence in records made under public supervision.

The shows and exhibition that had been held in the past attracted attention and stirred interest from the love of beauty of form and feather, but with the coming of the Laying Contests the general public—the keen business man and the dissatisfied city worker—realized that here was a business that was more than a fad, a hobby, that here was a business capable of returning a good profit on investment or a good independent living.

The man of means invests in a farm, employs an experienced poultry man and goes into the business. The city worker has not sufficient capital for this, so he starts a small backyard flock, learns how to handle it with profit, gradually expands, looking forward to the time when he can stop his city work and depend entirely on poultry for a living.

It is this awakening of public interest in poultry production that has so far been of first importance but while this, no doubt, will continue, ultimately the greatest value will come from the establishment of Records of Performance that will be above reproach.

In the past, records have been published that were made solely under the supervision of the owner. Many of these needed to be taken with a grain of salt but when records are made in public contests, government supervision creates a confidence that is not felt in home records.

With the establishing of an Official Record of Performance, the door to breeding for greater egg production will be opened in a way that has never been possible before.

iWth a view to stimulating interest in production, the Dominion Experimental Farms have established Egg Laying Contests throughout Canada. The first of these was started at Charlottetown, P.E.I., on November 1st, 1918, and created so much interest in that province that on the following November 1st, six other contests were started as follows:

The Canadian Egg Laying Contest at Ottawa with fifty pens competing. Federal contests of twenty pens each at Nappan, N. S., Cap Rouge, uQe., Brandon, Man., Indian eHad, Sask., and Lethbridge, Alta.

These latter, while not strictly confined to the provinces in which they are held, are intended to be more or less of a Provincial nature, while the Contest at Otawa is international in scope.

It is expected that next year not only will the capacity of the present contests be increased, but that new contests will be established in other districts throughout Canada.—George Robertson, Poultry Division, Experimental Farm, Ottawa, Ont.

"AMHERST" SPECIALS

Solid Leather Footwear

Here we feature one of our Genuine "Amherst Made" solid lines. This boot, in varying weights, covers a range of about twenty distinct models, from the finest Chrome Leathers and Winter Calf to the heavier Oil Grains for Heavy Service, made in Goodyear Welts, Standard Screw Construction.

In all grades we carry full and complete stocks of lasts, styles and leathers, both at Amherst and at our Halifax Branch 164-166 Granville Street.

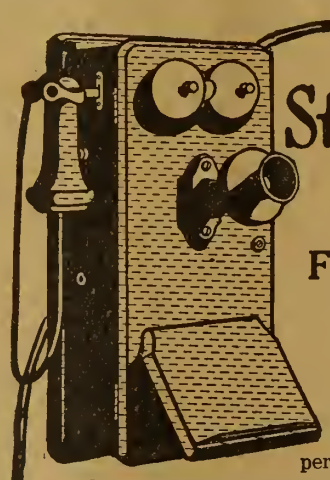
BREDING POULTRY FOR RESTOCKING FRANCE

The Directors of the National Avicultural Society of France have been granted a substantial credit by the French Government for the purpose of acquiring breeding poultry for the restocking of the liberated regions in France. This need was brought to the attention of the Federal Minister of Agriculture by Monsieur M. Chevalier, of the Credit Foncier Franco-Canadien, the Minister referring Monsieur Chevalier to the National Poultry Council.

The Council is now in comunication with the Avicultural Society of France and pending receipt of information as to the quantity of the different breeds required, the Porvincial Representatives of the Council are making a survey of their respective provinces in order to ascertain what stock may be available for export. The varieties favored by the French are the Barred Plymouth Rock, the White Wyandotte, Black Minorca and Rhode Island Red, and also Bronze Turkeys. An appeal is being made by the President of the Council to the Provincial Departments of Agri-



Stromberg-Carlson TELEPHONES

For City, Village and Farm

These are the ideal instruments for local or long distance work.

When you talk over a Stromberg-Carlson telephone you immediately sense its clear, powerful transmitting qualities. Transmitter and receiver are standard commercial instruments that give perfect satisfaction over local or long-distance lines.

Your message goes over the wires with distinctness. High efficiency and convenience are characteristics of every Stromberg Telephone.

culture, Agricultural Colelges, and the Canadian Press, to do all possible to assist in the acquiring of the necessary information to carry on negotiations with the Avicultural Society in France, and to take advantage of the opportunity presented to place Canada in a favorable international light as a producer and exporter of breeding poultry. The provincial officers of the National Poultry Council are as follows: P. E. Island—Dr. P. C. Gauthier, Vice-Pres. National Poultry Council, St. Louis; Nova Scotia—Mr. H. H. Hull. Poultry and P. S. Assoc., Glace Bay; New Brunswick—Mr. A. C. McCulloch, Poultry Division, Dept. of Agriculture, Fredericton; Quebec—Dr. S. Lafortune, Pointe Gatineau; Ontario—Dr. Robert Barnes, Health of Animals Branch, Ottawa; Manitoba—Mr. N. W. Kerr, Vice-President, National Poultry Council, Brandon; Saskatchewan—Mr. H. M. Arnaud, Sask. Provincial Poultry Assoc., Regina; Alberta—Mr. C. M. Baker, Alta. Provincial Poultry Assoc., Calgary; British Columbia—Mr. H. E. Waby, Provincial oPultry Assoc., Enderby.

It is interesting to note that in a report issued by the Commissioner General for Canada in France importations of eggs into that country in 1912 amounted to 303,243 (Quintaux Metriques), the exports for the same year being51,155. In 1918 the imports fell to 71,162 and the exports to 4,600. From these figures it will be seen that prior to the war France was a heavy importer of eggs, and no doubt efforts will be made to bring the poultry population of France above the pre-war level in order that she may be self-sustaining. Canada should be in a position to supply all the breding poultry required, but it will be necessary for all interested to give all assitance possible to the National Poultry Council in the locating and the selection of bred-to-lay stock.—Robert Barnes, President; Ernest Rhoades, Secretary, Live Stock Branch, Otawa, Ont.

DAMPNESS IN THE HEN HOUSE

If you have gone into the poultry house on a cold frosty morning and looked up under the roof you have no doubt noticed how the frost has collected there in great particles. Sometimes you will see great long strings if it dangling down and swaying back and forth. As a rule you will find the entire side of the roof covered with frost.

The presence of these frosted particles betokens too much moisture in the air, and to much moisture means that the air is damp, too damp for the biddies to live in if they are to do their best in turning out eggs when you want them most.

If a house is properly ventilated this moisture will pass off rapidly and not cause any great damage, but when the air is still and when there is no means of ventilation employed, the moisture will rise to the roof and collect there in frozen particles. As soon as the weather moderates this frost will dissolve and you will find great drops falling to the floor and wetting up the litter.

There is a way to stop this nuisance and to di it very cheaply. In fact, it is the method used by hundreds of poultrymen and others who live in cold winter climates to so handle the air in the poultry house that the dampness wil be constantly averted.

The method is simply to take a number of planks or poles and place them croswise on the rafters under the roof. Then cover these with new straw, filling up the space from these planks to about six inches of the roof.

You then open two or three small openings in the walls of the house and slightly under the roof. Underneath the straw and on the south side of the building you should have several openings that are allowed to remain wide open regardless of the severity of the weather. When storms are blowing they are covered with muslin frames to protect the inside of the poultry house. This gives you a constant circulation of air coming in below. As the air comes into the house and is heated from contact with the hens or their breath or the evaporation from the droppings, it passes upward and through the straw. The straw absorbs moisture content in the air.

You will find houses so treated sweet and free from dampness at all times. You might wonder why it would be necessary to use the straw at all, if you had the openings above. The answer is that even when there is no circulation of air, the straw is absorbing the dampness, while the small openings prevent it collecting too much at a time, by allowing some to pass out. This prevents too much of a good thing and mouldy straw.—C. S.

A ROOSTER THAT HAS ROUP

Would you please give me advice as to what to do for a rooster that has roup?—A. M.

As roup is a contagious disease, it will be necessary for you to remove the rooster away from the others. Roup is a form of catarrh affecting the mucous membrane of the nose and eyes, extending to the throat. The disease is caused by a germ which multiplies rapidly, and the discharge from the nostrils contains great numbers of these germs.

It is the safest policy to kill all birds so affected, and have their bodies burned, also the house and parts where diseased animals have come in contact should be thoroughly disinfected. In fact so virulent is the disease that it is not safe to put birds in th eaffected house for three months after the disease has stopped.

If your rooster is a valuable one, it may be worth while for you to try to effect a cure. If you have caught the disease in the early stage mix one teaspoonful of common baking soda with four ounces of water. Shake up well and inject a little into each nostril, then inject a little peroxide of hydrogen. If the eyelids are swollen, press them with the thumb and finger and wipe off any matter that may exude and use a little of the above lotion.

FEEDING GEESE

Always fatten geese by shutting them in a small yard and feeding all the shelled corn they will eat, usually for not more than three weeks. Geese should not be fed too long; as soon as they are finished they should be sold, as they will not take on weight after a certain time unless they are forced by cramminfi. Corn and barley rolled are good feeds.

Geese are filthy birds when closely confined and they will not do well in unclean quarters. Until one has had experience in feeding geese they should only handle a small number. There is a good market for extra fat geese in the larger cities, as Hebrews, whose religion forbids the use of lard, use goose grease in cooking. Where geese are force-fed they become exceedingly fat, often weighing 25 pounds, and develop livers of enormous size which sell for as much as $1 per pound. With corn and barley at $1 per bushel it seems to me that geese may be finished for market at a good profit, as prices have ranged high for thre or four years. Where many are to be marketed it would be wel to make ealy arrangements for their sale.—Miller Purvis.

"A NEEDED ANTIDOTE"

Delia Borden, of the "Miss Borden, Millinery," was having a busy day. She had opened her shop at 8 and sold hats ever since. It was now 4 o'clock of a warm, muggy May afternoon, and she was beginning to feel limp.

Still she looked blooming enough as she looked at her own reflection above that of old Mrs. Pearce in the tall mirror. Mrs. Pearce always came to be fitted for a hat just at the time when Delia felt her strength giving away. If ever there was a cantankerous, trying creature on earth, it was old Mrs. Pearce, for she was eighty, had been a beauty and could not give up the idea that she still was. She wanted her hats to make her look sixteen, and when they did'nt she berated the milliner.

Today in exasperation at her fault-finding Delia at last offered a black hat.

Old Mrs. Pearce's cheeks reddened. "Black eh?" she said, witheringly. "Now you must remember Miss Borden, that I never wear black. I don't choose to go about dressed as though for a funeral. If that's the best you can do I shall go to the other store."

"Well, here, try this one," said Delia, and she snatched from a box a red hat of so pronounced a shade and design that she had been keeping it out of sight for fear of offending the taste of conservative customers.

It was a daring thing to do, for she risked losing a good customer, but the old woman actually donned the hat and bought it

As she passed out Victoria Clinton came in. "Deel," she gasped, "did you sell Grandma Pearce that red hat?"

"I'm ashamed to say I did," Delia answered. She sank into a chair. "Victoria, I'm sick of hats. I wish I never had to see another one as long as I live. I feel as though I had been poisoned with millinery."

Victoria laughed merrily. "Take an antidote. How long have you sold hats anyway, Deel?"

"Fifteen years. And it does seem, Victoria, as though I'd rung all the changes possible on chiffon and velvet and straw and hatter's plush. I've used every kind of feather that ever grew on a bird and every kind of flower that ever budded. There aren't any new combinations or colors or shapes. I'm sick of going to New York twice a year to buy, for it only means millinery to me. Every time I stir out of doors I meet my hats and they're expressive as faces. I'm sick of living with girls like Miss DeSmythe in there," she lowered her voice. "It's a new one every season, and they're all the same. Poor little things, how can you expect them to be different? They don't know anything but hats. The worst of it is I'm beginning to dream hats all night. I can't get away from them even in sleep."

"I guess you're in a bad way," said Victoria. "Now I always thought I'd like to try millinery. if for nothing more than the sake of having all the hats I wanted."

"Victoria!" she cried. "Take the business. Buy it, anything so long as you help me to get free."

And so the bargain was made and a week later there was a new name on the sign. This read: "Victoria—Hat Styles."

And Della was free. For three days she sat in her room at Mrs. Pell's and wondered what she was going to do with her life now. The atmosphere of hats still lingered about her. She missed the liveliness of the shop much as she needed rest. "If I don't get away," she thought, "I shall be going back and asking Victoria to take me in as an apprentice! Hats seem to have become a part of my being."

Ten minutes later Joe Saunders, the eral estate man, called her up. "Say, Delia," he 'phoned—they had gone to school together—"now that you're out of the millinery business, don't you want to buy a house and lot or—or a chicken farm, with duck pond, complete, that's going cheap? It's a bargain. Better let me make you a price on it."

He was teasing and Delia knew it. At the same time she surprised herself and him by replying: "Name your price, Joe, and I'll consider it."

"Wait! I'll be right over!" cried Joe Saunders.

That afternoon he took her out to see the farm. It was a small, but neat and thrifty looking. The five-room house was brightened by clumps of daffodils growing in front of it. There were apple and plum and pear trees and a little barn that could be used as a garage.

"You want to get a Ford car," said Joe. "That will shorten the distance to town."

"I shall," said Delia firmly. She had picked a handful of daffodils and was studying them thoughtfully. It had been a good while since she had seen anything but a hothouse flower or an artificial one. Her heart went out to them.

Joe Saunders looked steadily at the wistful face above the daffodils. Hitherto he had only seen in Delia Borden the fashionable milliner, who was the best advertisement of her own creations, but here was a woman with a heart and soul. He went back to the car whistling and tried to start it without turning on the ignition.

"Absent minded, Joe?" Delia inquired.

"Never knew I was before," he muttered.

In a few days he took Delia and Mrs. Cady out to her farm, whither a load of furniture had preceded them. Mrs. Cady was going to help make a home for Delia, and then keep it afterward, for Delia meant to spend her whole time raising chickens. Mrs. Cady knew something about the business, and with such outside help as books Delia was sure she could make a success.

When in mid-summer Joe drove out to the farm to see her he found Delia hovering over a brood of chicks so new that they still had bits of shell clinging to them. "Well, well," said Joe, "you are doing it, aren't you?"

"Why, of course," Delia looked up at him. She wore a gingham pinafore and a "cow's breakfast" hat, which shaded her face and neck. "I've had real good luck with my incubator babies, considering. I don't expect to succeed like an old hand. It's too soon to expect a profit, but I'll make a profit later in the game. I'm sure. You must see the ducklings! They're just learning to paddle. And we've got a cow, Joe—a real Jersey. She only cost $90, which is cheap enough for a Jersey. Come and see her."

"I guess you're having a pretty good time," said Joe.

"Oh, I am! The time of my life. Why, I'm so happy that sometimes I don't know myself. How I ever stuck to millinery as long as I did is a mystery. I was poisoned with hats. But here's my antidote," she waved her hand over her possessions.

Joe stood watching the ducklings take to the water with a great performance of pink paddles. "Game little bird!" he said. "How many ducks have you?"

"Well," Delia considered, "I set a hundred eggs, and I only got nine ducks. I suppose that's a bad percentage for the eggs came awfully high. Eggs and feed are rather ruinous," she added thoughtfully, "but of course, just as soon as I get my flocks established I'll have no trouble."

"Of course," agreed Joe, sympathetically. "You seem to find time to grow a lot of flowers," he remarked, admiring her blazing garden.

"That's extravagance," Delia said shyly, "Mrs. Cady clamors for vegetables, but—— Well, I'll tell you, Jot. After handling artificial posies for 15 years I never thought I'd want to see a flower again, but these are different. They seem to restore my waith in beauty. I don't know that I can make you understand."

"Yes, you can," Joe said earnestly. "I'd understand even if you did not say a word—just by looking at you. There's all the difference between what your are and were than there is between this"—he clipped a glowing rocket from its stem—"and its French prototype." Then he went away and left Delia to ponder upon what he said.

She bent her face over the rockets and smiled, and her face was almost as pink as they.

By fall it was evident to Delia that her venture was far from being successful. She had used up a great deal of money and she had only 11 chickens and four ducks to show for it. All sorts of evil had beset the fowl.

"I guess she's sort of discouraged," Mrs. Cady said to Joe, who had driven out again. "She won't say nothing, but I can tell. She can't afford to keep this up. Why, she'll go back to hat making'

"No she won't," said Joe. "Where is she?"

"Picking up chestnuts back of the house there."

Joe went to find Delia. They came back together and hour later, hand in hand.

"You shall keep house for us, Mrs. Cady," Joe said gayly, "and summers we'll all come out here. What do you say?"

"I'm afraid you're surprised," murmered Delia.

But Mrs. Cady shook her head. "Land no! I should a been surprised if you hadn't. Anyone would fall in love with Delia. They'd be fools if they didn't."

THE MEAT YOU BUY

"I always buy here," observed a neat young owman in a natty blue suit, glancing about her with an air of satisfaction. "Everything looks so spic and span." Her companion nodded, looked keenly about and then grew thoughtful.

The butcher-shop did look spic and span. On the wooden counter reposed several calves' heads, each surrounded with a necklace of onions, carrots, or radishes, and each with a fresh sprig of parsley in its mouth. The meats were arranged by a window artist, who had missed his calling, set out in neat patterns interspersed with green, yellow and red vegetables. Hanging from racks at the sides of the shop were numerous carcasses, all neatly assorted.

The floor was covered with clean sawdust. The butcher and his assistant wore white sleeves and white aprons. From a decorative standpoint the shop was an immense success. But the thoughtful woman pondered.

"Dou you like the meat all out on the counter that way?" she asked. "I should think it would be better inside."

"Oh, well," retorted her companion, "I like to see my meat and make my choice, and you cook it anyway."

That is true. But it is questionable wehther a nice person likes to eat fly-specks, street and road dust and accompanying filth, be it cooked or raw.

That butcher shop was nicely decorated, but it exposed to dust and dirt all its wares. In a good butcher shop no meat is visible unless in coolers covered with glass. Yet not one shop in a thousand can show counters devoid of meat.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

Do Not Neglect The Bad Cold OF TO-DAY

IT MAY BE SERIOUS TO-MORROW

May Develop Into Bronchitis, Pneumonia and perhaps Consumption.

Miss Mary Prouse, R.R. No. 1, Cedardale, Ont., writes:—"I had the Influenza in November last, and it left me with a terrible cough. I did not attend to it until it got so severe people warned me it was time to see about it. I went to the doctor and got some medicine. He told me it was a bad attack of bronchitis. I could not sleep, and would have to sit up nearly all night, it was so difficult for me to get my breath. The doctor's medicine did not seem to be helping me the least bit.

One of our neighbors came in one day, and told me about Dr. Wood's Norway Pine Syrup. I tried it and took two bottles. No person could believe how it helped me. I have recommended it to different people since, for I believe I have reasons for doing so.

Dr. Wood's Norway Pine Syrup has been on the market for the past 30 years, and stands out by itself as a remedy for all coughs and colds.

Be sure and get the real "Dr. Wood's" when you ask for it. Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

The fault of this lies with the housewife, not with the butcher. As the young matron said, housewives like to see the meat they buy. They are not satisfied to have the meat man bring one piece out of the ice box. The believe that he must have choicer cuts hidden away, and they make him bring out piece after piece, until the putting away process after every purchase becomes too weary-same to be continued.

In addition, many women, nice women, too, insist upon fingering the meat, punching it here and there to determine its texture. This handling of meat is unnecessary, and it is not justifiable under any circumstances. The appearance of the meat indicates its condition, and the punching adds very little to the information given by one's eyes, not enough to make it worth while.

A housekeeper should insist that her butcher keep his wares covered from flies and dust, and from pernicious testing fingers.

She should do more than this: she should visit the rear rooms of the butcher shop. Comparatively few women are aware that in many butcher-shops sausage is made in the rear room from the scraps and trimmings of the shop.

Clean Chopping Blocks Are Essential

There is no objection to this sausage, provided that it is clean throughout. To accomplish this, the counters, the chopping blocks, the boxes into which the scraps are dropped, must be clean and washed daily. The best meat counters are those made of porcelain or marble, and the best meat chopping blocks are those of a composite material which resist the knife and hatchet and do not cut.

Wooden blocks are almost universally used, but they are almost impossible to keep clean. In deep cuts made by the butcher's tools the meat putrefies and decays. A thorough scraping every day and scrubbings with hot water in which a quantity of washing soda has been dissolved is a help to cleanliness. If the butcher cannot afford to re-equip his shop with the composite blocks, he can at least use this aid.

The boxes into which scraps are dropped should be of some material easily scalded out. They should be washed daily.

How "Fresh Country Sausage" Are Made

In the rear rooms of many establishments barrels of scraps are kept until they begin to smell so objectionable that they must be used. The barrels themselves are never cleaned, the room is filthy, unventilated, unscreened, visited daily by numerous flies, rats, roaches and other vermin. Yet here are produced pounds of "fresh country sausages" spiced and doctored until it tastes sweet and good.

There is no reason why the rear room should not be clean, light, screened, and why the sausage-scrap container should not be clean and washed daily.

Barrels, crates and meat-scrap containers are much cleaner if they are kept on stands and not directly on the floor. This makes them easier to move, especially if the stands are on castors, a very simple matter for any butcher. The stands permit cleaning under them, which heavy barrels set upon the floor do not, and vermin come direct from floor to barrel which stand a long time, such as those of salt, pickled or sour meats. Even if the room is screened such barrels should always be covered from floor dust.

All butcher shops have refuse. Some of them render the fat into lard upon the premises. This is often done in the sausage room or in a rear shed, and the shed used should be screened and clean.

The cooler-room itself should be clean, and should contain no animals with pelts or skins on. This hanging of pelted animals next to dressed meats is a comon practise. Sometimes the skins are infested with vermin, which transfer themselves to the other meats.

The cooler door will always merit attention. It should be dry, and any boxes or barrels in it should be on stands to prevent mold. A thermometer hung near the window in the door will show whether the cooler is really a cooler or merely an unventilated room, where the quantity of ice kept is insufficient to cool anything.

No killing should be done upon the butcher's premises, unless there is a distinct slaughter house attached.

Usually there are municipal or town ordinances which forbid indiscriminate slaughtering of food animals, but often these are disregarded. Chickens are exempt from the rule, and may be killed at the shop, but they should not be kept in the room for days until they are offensive. They must be kept in an open yard and the killing should be done in a screened shed.

A clean shop with sanitary rear rooms, counters free from exposed meats, a good ice box, well-screened windows—these may be acquired by any local butcher if the women of the community demand it of him.

Mr. J. A. McFarlane of Napanee, Ont., had chilblains so bad that he couldn't wear boots. Egyptian Liniment relieved them. Don't suffer from chilblains this winter. This liniment is also for Frost Bites, Burns Scalds, Cuts, Bruises, Sore Chest and Throat, Neuralgia, etc.

CARE OF PERSON WITH INFLUENZA

Care of Patient.—Plenty of fresh air in room, without exposure to draft. Keep patient away from rest of family and hang sheet which has been dipped in Carbolic solution across door. Have a basin of solution in room and kep sheet moist with whisk; keep soiled linen separate, and when removing from room roll in something which has been wet with disinfectant. Patient should use gauze or old cotton instead of handkerchiefs, which should be rolled in paper and burnt.

See that patient is well nourished, bowels move daily, normal quantity of urine voided, plenty of water to drink; liquid food should be given every two hours; keep patient warm at all times and STILL, as heart action is usually involved.

Care of Self.—Infection is from respiratory organs so avoid as far as possible direct contact—breathing, sneezing and coughing, of patient; after contact gargle thoroughly and breathe in nostrils disinfectant as doctor shall suggest (1 teaspoon of salt, 1 teaspoon soda, 10 drops carbolic to pint water.) Wear apron, long sleeved if possible, while waiting on patient, hang apron outside of the window of patient's room when not in use. A piece of gauze folded so as to cover ose and mouth should be dipped in a disinfectant and used when attending patient. Disinfect hands after contact with patient and before eating, in bichloride—1 tablet in a quart of water, or whatever the doctor sugests. Bichloride destroys metals so do not wear rings, wrist watches, etc. Keep hair covered with cap or towel; keep in open air as much as possible and keep warm, sleep with windows open. Doctor will prescribe care of patient; do not eat meals in patient's room.

Care of Patient, additional.—Keep patient's dishes separate from those used by other members of the family; food taken from room of patient should be burned at once.

Disinfectants.—2 dozen Bichloride tablets; 8 oz. carbolic. Mecuric Iodine Soap. cans chloride of lime (for excreta). 3 yards of cheese cloth for masks; bolt of tape; aprons with sleeves if possible; warm dressing gown; bedroom slippers; covering for the head; antiseptic soap.

A Few Light Diets, With Doctor's Consent

Albumen Water.—To juice of half lemon add white of one egg cut with with a knife, not beaten, fill glass three-quarters full with water and sweeten to taste; extremely good when patient is very feverish.

Beef Tea.—Cut one pound of beef in small pieces, almost cover with

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309 Windsor, Ontario

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with oue's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

COOKERY COLUMN

COCOA BISCUIT

2 cups flour
4 teaspoons baking powder
½ teaspoon salt
2 tablespoons sugar
4 tablespoons Cowan Cocoa
3 tablespoons butter
2/3 cup milk

1. Mix and sift dry ingredients.
2. Rub in the butter with the tips of the fingers.
3. Add milk gradually, mixing to a soft dough.
4. Toss on floured board.
5. Roll lightly to one-half inch in thickness, cut into small biscuits.
6. Bake in a hot oven 12 to 15 minutes.

cold water ,put on in double boiler and cook slowly for at least 3 hours, salt to taste.

Boiled Custard.—Thoroughly beat three eggs and add to a pint of milk, add two tablespoons of sugar and ½ teaspoon vanilla and a pinch of salt, put in double boiler and stir till it thickens.

Oatmeal Gruel.—To one cup of oatmeal take three cups of cold water and half teaspoon of salt, let it stand half an hour, put in double boiler and cook slowly 2 hours; strain and thin with milk, sweeten to taste. If patient is very ill gruel should be very thin.

Scraped Beef.—Scrape half a pound of beef, press in little cakes and singe slightly over a hot fire.

Apple Drink.—Cut up two large tart apples; put in one quart cold water, boil down to one pint add sliced lemon and sugar to taste.

If patient refuses to take eggs, one may be put in a cup of tea without patient noticing it.

SOME TASTY COOKIES AND GRIDDLE CAKES

Bran Griddle Cakes

Try these some morning as a change from the usual pancakes.

1½ cups bran, 2 teaspoons baking powder, 1 egg, 1½ cups flour, ½ teaspoon salt, sweet milk.

Sift the flour and baking powder add the bran and salt. Beat the egg well, add milk and mix with the flour and bran, using enough milk to make a thin batter. Cook on a hot griddle . Serve with syrup and butter or sprinkle with scraped maple sugar; roll up and serve very hot.

Ginger Bread

1 cup shortening, ½ cup sugar, 2 cups molasses, 1 teaspoonful salt, 2 teaspoonfuls cinnamon, 3 teaspoonfuls sugar, 1 teaspoonful cloves, 1 teaspoonful baking powder.

Cream the shortening and sugar. Add the molasses, sour milk and powder. Beat vigorously for two minutes.

Pour into two well buttered loaf cake pans. Bake in a moderate oven for thirty minutes. Serve with whipped cream as a dessert.

Nut Oatmeal Cookies

1 cup shortening, 3 eggs, 3 cups rolled oats, 1 teaspoonful salt, 2 teaspoonfuls cinnamon, 1 teaspoonful allspice, 1 cup raisins, 2 cups sugar, 2/3 cups milk, 3 cups flour, 1 teaspoonful soda, 1 easpoonful cloves, 1 teaspoonful baking powder, 1 cup nut meats, 1 teaspoonful vanilla.

Cream the shortening, add the sugar and eggs. Beat vigorously for two minutes. Add the milk and the rolled oats (put through a meat grinder.) Mix and sift the flour, salt, soda, cinnamon, cloves, allspice, and baking powder. Combine these dry ingredients, raisins (chopped), nut meats and vanilla, with the creamed mixture.

Mix thoroughly and drop from the end of a spoon upon a well-greased floured pan. Bake in a moderate oven for fifteen minutes.

Salad Dressing

Three eggs, two tablespoonfuls of butter, one-half cupful of sugar, one teaspoonful of vinegar, one teaspoonful of salt, pepper and mustard, one cupful of sweet cream. Mix sugar, salt, pepper and mustard together dry. Beat the eggs, add vinegar and seasoning and cook. Take from the stove and beat in the butter, let cool and then beat in the sweet cream.

Potato Flour Cake

(A conservative recipe from which can be made any number of delicious desserts.) 6 eggs, 2/3 cups sugar, 2 tablespoons strained honey. 1 tablespoon lemon juice, 1 tablespoon grated lemon rind, ¾ cup potato flour, 1 level teaspoonful baking powder, ¼ level teaspoonful salt.

Beat the egg yolks for three minutes. Add the sugar, honey, lemon juice and grated rind. Beat for two minutes. Mix and sift the potato flour, baking powder and salt. Beat the egg whites very stiff. Add alternately the dry ingredients and the egg whites, mixing in lightly. Pour into a floured angel cake pan. Bake one hour in a slow oven. Use as a base for the following desserts.

1.—Cut into cubes and serve with sweetened whipped cream.

2.—Cut into two-inch cubes, hollow out their centres and fill with preserves, jelly or a creamed filling of any kind. Top with whipped cream.

3.—Serve with ice cream on top of individual dishes.

4.—Cut inhalves. Spread a corn starch filling between. Cover with a sweetened meringue and bake five minutes in a hot oven.

MAKING PORK SAUSAGE

To each three pounds of fresh, lean pork add 1 pound of fat. As the pork usually used for sausaage is the shoulder, neck and lean trimmings, the sausage is quite likely to be too fat unless part of the fat is removed and used for lard. Mix the fat and lean together in chopping. Where a rotary cutter is used it is best to cut the meat twice. After it is cut the first time spread it out thinly and season. One ounce of pure, fine salt, one half ounce of ground black pepper, and one half ounce of pure leaf sage, rubbed fine, to each four pounds of meat will suit the taste of most people. The seasoning should be sprinkled thinly over the cut meat and the meat again run through the cutter to mix the seasoning thoroughly. This method will give a more even mixing of the spices than can be obtained by working it with the hands. For immediate use the sausage may be packed away in stone jars or crocks, to be sliced for frying. Many people stuff it into cas-

Hantsport Fruit Basket Co,. Ltd.

HANTSPORT, N. S.

ings made from the small intestines of the hog. When this is done the intestines must be turned inside out and care fully cleaned.

Mixed sauage may be made from pork and beef in almost any proportion. When three or four hogs and a beef are killed on a farm for the year's supply of meat a nice supply of ausage can be made from the trimmings. Sausage should not contain too much fat. A good proportion is 2 pounds of lean pork, 1 pound of fat pork, and 1 lb. of lean beef. Chop together fine and season the same as pork sausage. Pack in jars, muslin bags, or casings. This is not so fat as clear pork sausage.

CANADIAN CO-OPERATIVE WOOL GROWERS, LIMITED

(Continued from page 375)

warehouse, Toronto, in the grease and there graded and that the Canadian Co-operative Wool Growers, Limited, advance to such shipper 80% of the then market price of each grade as soon as the wool is weighed in and graded; final settlement to be made when the wool is sold or in the alternative at the end of the Company's year and that Dominion Government supervision at the central warehouse at Toronto be asked for.

Another resolution was to the effect that the Canadian Co-operative Wool Growers, Limited, undertake a publicity campaign by advertisement in public prints and otherewise with a view of bringing the principal aims and objects of the organization to the attention of every breeder of sheep in the Dominion of Canada, thereby soliciting their support both as shareholders and shippers. It was further recommended that competent field men be placed in every Province to assist the local director in pushing the work of the organization.

Other Resolution

Importation of Frozen Mutton.—Moved by Mr. J. W. Renton, seconded by Mr. G. L. Telfer, that,

Whereas at the Annual Meeting of this organization held in February, 1919, a certain resolution was passed in regard to the importation of frozen mutton,

And whereas up to the present time no definite action has been before the Department of Agriculture with a view of having something done at the earliest possible moment.

Moved by Miss E. C. Hind, seconded by Mr. R. Knights, that this matter be laid before the Minister of Agriculture by Mr. Wilson and Mr. Logan. Carried.

Ranges in British Columbia.—Moved by Mr. G. C. Hay, seconded by Mr. R. Knights, that,

Whereas the ranges in British Columbia are showing the effects of over-grazing to a very marked degree,

And whereas the Provincial Government is doing good work in the way of limiting the number of animals on certain ranges and in so far as possible alloting the higher ranges to the sheepmen,

Be it resolved that the Dominion Government be requested to carry on similar work with respect to the ranges in the Railway Belt as the Provincial Government is doing with respect to its range lands and reserve in so far as possible the higher leases for the sheepmen.

The mover and seconder of the above agreed to change the motion to include Alberta. Carried.

Directors and Officers

The following men were elected as Directors of the organization for the year 1920:

Col. Robt. McEwen, G. L. Telfer, W. D. Dryden, Ontario; J. D. Wilson, D. B. Howell, Saskatchewan; W. I. Smale, George Gordon, Manitoba; J. R. McDowell, J. A. McClary, Quebec; Bishop Levi Harker, J. W. Renton, Alberta; S. A. Logan, Nova Scotia; Geo. C. Hay, British Columbia; W. H. McGregor, P. E. Island; A. E. Trites, New Brunswick.

At a subesquent meeting of the Board Col. Robert McEwen was elected President; J. D. Wilson, 1st Vice-President; S. A. Logan 2nd Vice-President. The members of the Executive was increased from five to seven. The members of the Executive elected were: J. A. McClary, Lennoxville; Col. Robt. McEwen, London; G. L. Telfer, Paris; W. A. Dryden, Brooklyn; George Gordon, Oak Lake, Man.; J. W. Renton, Calgary, Alta.; J. D. Wilson, Maple Creek. Sask., and G. E. O'Brien was elected General Manager and Treasurer.

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. Dr. Chase's Ointment will relieve you at once and as certainly cure you. 60c. a box; all dealers, or Edmanson Bates & Co., Limited, Toronto. Sample box free if you mention this paper and enclose 2c. stamp to pay postage.

THE AFTER EFFECTS OF THE "FLU"

Has Left Many Weak Hearts.

This terrible scourge has left in its train weak hearts, shattered nerves, and a general run-down condition of the system.

Thousands of people, throughout Canada, are now needing the timely use of Milburn's Heart and Nerve Pills to counteract the effects of this trouble which a short time ago swept our country.

Mrs. C. C. Palmer, Keppel, Sask., writes:—"I wish to inform you of the great good Milburn's Heart and Nerve Pills did for me. After a bad attack of the "Spanish Influenza," my heart and nerves were left in a very bad condition. I got two boxes of your pills and I must say they are the best I ever used, and I have taken a great many different kinds. I will always keep Heart and Nerve Pills in the house."

Milburn's Heart and Nerve Pills are 50c. a box. For sale by all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

TRUE NEIGHBORLINESS WHEN SICKNESS COMES

This is no talk on nursing nor even on the subject generally exploited under the well-worn title, "Health Hints." Let us discuss not what to do for the sick on the farm but how to help the well folks who must take care of the sick and often have a harder time of it than the patient does. So much intended help is an actual hindrance. Many neighbors out of real sympathy and interest call up on the telephone. Don't. It takes time for the tired mother to answer. In addition to her regular duties she is both day and night nurse. The telephone bell is at best a necessary evil. I knew one really helpful neighbor who arranged to get the report form the family and then it was understood that the other neighbors should call her and not the sick home. Inquiries, expressions of sympathy, offers of help, all went through her as a sort of clearing house, and the weary wife, waiting at what proved to be her husband's deathbed, was spared much time and expenditure of strength.

Another helpful thing to do is to take a restless, noisy child home with you and care for it ill the sick member of its household can have it back again. This may prove a big program, but think what it means to the mother. But you say, you have no tact in dealing with children. Maybe you are good at the washtub. I had one friend who went to the sick home and said: "I can't nurse and I never cared for children, but I want you to put up the wash and I will come for it regularly till you are well again." The mother protested, but her sensible neighbor and good friend marched off with the wash, and what a relief it was in the home where more washing than ever was required. It is so much easier to rush into a burning building and rescue a child than to take a cold bath on a winter morning. The bathing is prosaic; the rescuing is heroic; but my heroine of the washtub I think worthy of a place in the calendar of saints, and I vote her with both hands a halo. The housewife told me afterward she surely would have broken down if that "Old man of the sea," the weekly wash, had not been taken from her shoulders.

Let the Nurse Do the Nursing

Baking is another thing that can be done just as well away from the sick home. Do that instead of volunteering to come and nurse if you have no special gift of training as a nurse. Professional trained nurses at twenty or twenty-five dollars a week are still very rare in the average farm home. There are two reasons for this: the great expense and the preference of nurses for the city. There are, however, in most country neighborhoods women who are natural nurses and have had a good deal of experience. When one of these may be secured she is a great relief to the mother. And, mothers, if you get a nurse who knows as much or more than you do about the case in hand, then do be wise enough to let her do the nursing. Save yourself against the time when she will have to go home or will get tired out. So many mothers, following the maternal instinct rather than the motherly judgment, linger night and day at the bedside when it is not necessary. They wear themselves out to no purpose and when a crisis comes their vitality and freshness, so much needed to pull the patient through, are all squandered. Your working power is not immeasurable like the water in the ocean. Hoard it against a time of greater need.

In many country communities it is a downright shame the way young mothers are imposed upon. The first Sunday after the new baby arrives a regular procession of relatives, neighbors and friends are on hand to see the newcomer and to congratulate the mother. She is no doubt glad to see you and proud to exhibit her young hopeful, but the baby will keep till the mother is well and strong again. It is certainly kinder to send congratulations than to bring them. I have one wise friend who positively refused to put her babies on exhibition, keeping them for some weeks upstairs where they were wholly undisturbed. She even gave offence to some of the old-time baby inspectors, who voted her stuck-up. Those first few months of undisturbed repose gave her children so good a start that every one of the four was a good baby. Every baby is a good one if let alone and allowed to sleep. Many a young child is voted ill-tempered and cross when really it is nervously worn out.

Cooking something to send in for the sick is often a nice thing to do. It comes from a true neighborly spiriit and from a feeling of sympathy, but often the mark is missed. I believe I might say it is more often missed than hit. The chances are rather against getting what the patient hankers for and the physician will allow. Although the sender will never know it, much of the food thus sent in is eaten by the well members of the household. I recall one case where a young man was making a good recovery from tyhpoid and on Thanksgiving Day he was sent some slices of turkey. It tasted so good, but nevertheless it threw him into a relapse and killed him. We know now that solid food must be kept from such convalescents, but at that time neither the sender nor the young man's family knew it. Sending food to a patient is almost as risky as sending him medicine. I am not discouraging this friendly custom so prevalent in some country communities, but I am most emphatically insisting that it must be safeguarded.

Old cloth is usually most convenient in a sick room and the family supply runs low in cases of protracted illnesses. Of course new cloth could be bought, but that is unnecessary. Send in old sheets and the like. They will be appreciated. Not only the thing itself is appropriate but the spirit behind it all cheers the recipient. The weary one in the sick room, watching, working and waiting, feels that her good friends have not forgotten her, that they are helping her make the lght. The warm glow about her heart strengthens her resolution and steadies her hand. Not only in joy but in sorrow as well we feel that we must share things with others. I knew one good woman who kept a wheel chair that her old mother had once used. It might have gone to the second-hand store, for no one in the family needed it, but she kept it to lend. Nor did people have to "borrow" it. She took gerat delight in taking it to a home where it would be needed. A convalescent in a wheel chair is so much happier and the one doing the nursing is relieved of so much lifting and carrying. Yet a good chair costs considerable, and one is almost never seen in the general equipment of a household unless there be a cripple in the home. I shall hold in my heart's picture gallery the view of that good woman with the happy smile on her face as se drove past with her wheel chair in the little wagon. You probably have no wheel chair, and old cloth may be at a premium most of the time in your house; but there certainly is something you have or there is something you can do. Give it careful thought and something will be suggested. Do not be afraid to do some very simple thing. Life in its great bulk is not made up of spectacular deeds, such as make good copy for sensational novels, but of trifles; the sum of these is no trifle, I can assure you.

Fruit and flowers are always acceptable. The same kind of fruit may be in the orchard or in the garden of the neighbor to whom you are sending it, but she may not have the time to go out and gather it. Anyway, the fact that you wanted to do something is a comfort to her and it pleases the patient to be remembered. It makes a pleasant break in the monotony of the sick room. It is a good plan to send a plant when you can instead of cut flowers that wither so soon. The plants are watched with so much interest as they grow. This is truer in winter than in summer. I have a friend who is very generous with his powerful field glasses. A patient in a comfortable wheel chair looking at the birds in the trees or on top of the barn or watching the men haying in the meadow will entertain himself by the hour. Reading aloud has its limitations. It is hard on the reader and soon wearies a nervous patient. However, it is wel lto send a bundle of illustrated magazines. The pictures are a good diversion, requiring but little mental effort.

Hospitals in the country are about as rare as white blackbirds. The farm wife and mother cannot get competent help in the home to care for it while she herself turns nurse, nor

Paying Toll for Neglect

Needless exposure to damp and cold frequently result in a derangement of the Kidneys and Bladder.

When these important organs fail to do their duty, various evils arise, such as rheumatism, swollen hands and ankles, stiff joints, lumbago, sciatic neuralgia, stone in the bladder or gravel, excruciating pains in the back and sides, constant headaches, dizziness, specks floating before the eyes, uneasiness of mind without reason, and general debility.

These are signs of serious kidney and bladder trouble, which require immediate attention. The most dependable remedy is found in Gin Pills. They often prevent the operations which constant neglect may render necessary. They quickly and safely relieve congested kidneys, passing stone and gravel, healing and soothing inflamed organs and restoring them to normal. Thousands of letters from people who have been relieved are continually coming to us. Their writers often beg us to spread the good news to other sufferers that Gin Pills certainly and surely will bring the help they need. Send for free sample, or go direct to your druggist or dealer, 50c a box. Money refunded if relief not given.

Stiffness

It is astonishing how quickly Minard's Liniment relieves stiffness and lameness.

Gives Great Relief

Mrs. A. R. Calcott, 26 Park Ave., Guelph, Ont., writes—"My husband has used Minard's Liniment frequently, always with good results. Friends of mine use it for rheumatism and tell me that it gives great relief."

Mrs. Fred Johnston, Box 735, Thorold, Ont.—"I suffered very much with neuralgia in my face last winter, was advised to try Minard's Liniment, and was relieved immediately after first application. I persevered in using it and it has entirely gone. This winter I can go out without tying up my face and give the credit to Minard's Liniment. Have told several people about Minard's, and others are using it."

FIVE ROSES FLOUR
for BREADS, CAKES, PUDDINGS, PASTRIES

COOKIES, Gems, Snaps, Jams-Jams, Crackers and Wafers—keep the jar well filled for the pantry pirates! And even grown-ups find they fill a vacant place most pleasantly when nothing else will do.

But first make sure of the

Exceptional Keeping Qualities

that the use of FIVE ROSES flour brings to economical home baking.

The lasting freshness and aroma so essential are assured because of the stubborn manner in which FIVE ROSES bake things retain their original freshness. Thus, *without fear of waste,* you can make a lot of these dainty goodies at one baking.

Then, due to the fineness and liveliness of this famous flour, your cookies and wafers are much more melting and digestible.

To these appetizing qualities, FIVE ROSES adds the wonderful nutrition of Manitoba's richest wheat, together with the amazing strength that spell *economy* in baking.

There is a bag of FIVE ROSES flour waiting for *YOU* at your dealer's.

Over 35 Magic Cooky Recipes

Hundreds of suggestions on bread, puddings, rolls, buns, biscuits, fried cakes, pastries and cakes of all kinds. Every one of its 144 pages points the way to thrifty baking. The famous FIVE ROSES Cook Book is already indispensable in over 500,000 homes. It becomes YOURS for 30c (stamps or silver. Address Dept. "O" LAKE OF THE WOODS MILLING CO., LIMITED, Montreal and Winnipeg.

can she get as a rule the city professional nurse, nor has she the hospital habit. In many rural communities there still persists a deep-seated prejudice against hospitals. It would take the sheriff and a posse to get some people into a hospital. Why not a township hospital as well as a township consolidated school? "Oh, that is Utopia," some one exclaims. It may be the township is too small a unit, but two or three townships certainly are not. One hospital at the county seat, mostly monopolized by the town people, will not fill the bill. Farmers know and believe in their neighbore, but they are very shy about going to strange places when ill. A modern hospital well equipped for surgery is very expensive to build and still more expensive to maintain, but there is much sickness in farm homes that could be well cared for in a near-by rural hospital, a branch, if you please, of a larger institution at the county seat.

Why should the visiting nurse be only a city blessing? A rural hospital, as a center for the equipment and as a home for some rural visiting nurses, would meet a crying need and I believe would have the hearty support of the farmers. The Rural Nurse Department of the Red Cross offers one solution of the problem. The Red Cross has built up throughout the country an organization which could be utilized in the development and growth of rural nursing in time of peace. If we farm mothers are to be cooks, laundresses, waitresses, housekeepers, mothers, business managers and so on to the end of the chapter, what time, strength or skill will we have left for that most exacting and exhausting work of nursing? When sickness comes in the farm home we will continue to do our level best, but we should not gon on in the old way forever. As the factor has lifted much drudgery from the farm woman's shoulders so the hospital and rural nurse will relieve her still more in a most important realm.

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's

Caustic Balsam

IT HAS NO EQUAL

For the Human Body

—It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions, CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

BEES, THEIR VALUE IN THE ORCHARD

(Continued from page 379)

for the bees to reach it only on decidedly warm days, and the flowers close in the afternoon, so it does not draw the bees away from fruit bloom to any extent in broken weather. To make a good job of pollinizing the fruit blossoms it is evidently desirable that the hives should be located right in the orchard, and that there should be plenty of bees. For a small orchard, two strong colonies would provide plenty of bees, but to work to a distance of one fourth of a mile on all sides ten might be needed. The habit that bees have of spreading themselves over the country when working is a valuable one for the orchards.

In some districts where the pollination by bees is a pressing problem, it might be well for the Fruitgrowers' Association to consider undertaking the stocking of a few orchards with bees and placing a trained apiarist in charge of them. The Apiarist could have, say, two helpers, who would thus be training for taking charge of other districts. It would be feasible to distribute colonies from a central apiary to a number of orchards not less than two miles distant to be there during the blossom season, and then to bring them back at the end of the season. In this way, the labor of attending to the bee throughout the season in a number of differen places would be avoided.

I have been asked to say whether bees can be procured. My answer is, prepare them with care in the winter and you will soon have plenty, because the Annaolis Valley is a particularly favorable region for the breeding of bees, and the multiplication of swarms. When visiting the Experimental Farm at Kentville on July 31, 1915, I found that a prime warm that had been produced by a prime swarm was preparing to swarm again, indicating a rate of production greater than any met with in all my previous experiences in Canada or England. What is the use of going to the risk and expense of purchasing bees from a distance if they are allowed to die from neglect in winter? Where however, it is impossible to procure bees locally, I recommend getting two-pound packages in June or July, from reliable dealers in Quebec or New England. The former advertise in "The Canadian Horticulturist and Beekepper," published at Peterboro, Ont. and the latter in "Gleanings in Bee Culture," published by the A. O. Root Co., Medina, Ohio. Those who are experienced beekeepers might try purchasing two-pound lots in May from the professional dealers in Alabama. If well packed, I see no reason why, with luck, the majority of the packages should not come through in fairly good condition by parcel post, but considerable losses may be expected and combs free from foul-brood infection hould be given the bees on arrival.

It is evident that bees are of no use in the orchard unless trees of a different variety are planted close to the variety they intend to pollinize. Since bees, when working steadily, do not fly about an orchard much, but visit adjacent flowers, the most complette transferrence of pollen would not be got by having the two varieties in alternate trees or alternate rows. Whether a greater distance apart might still be satisfactory is a question for experiment by the fruit growers. However, it would be useless to have a late flowering variety like Northern Spy as a pollinizer for an early flowering variety such as Gravenstein, Golden Russet or Wealthy. As a general rule the pollinizer should be of a variety that flowers fully as early as or a little earlier than the variety that it is intended to pollinate. Some varieties are better pollinizer and have a stronger affinity for certain varieties than others. These varieies should be selected in planting.

The subject of bees and fruit is not complete without allusion to the spraying of fruit trees in full bloom with insecticides. Arsenical spraying made during the time of full bloom have been found to cause the death of bee, and for the protection of beekeepers, laws have been en-

Here's the Evaporator to Solve the Syrup and Sugar Problem

Thousands of grove owners do not work their groves for very little reason. Lots of them just can't make up their minds. Yet if we were to put a proper outfit in their grove and they saw it work so easily and the money there was in it—for one season—they would fight to prevent us taking the outfit away again, even if the cost were a good deal more. An unworked grove these days is like an untapped reservoir with thirsty people around. A big demand and no supply. Why not put a

GRIMM CHAMPION OUTFIT

in your grove. One of a right size to work your bush to full capacity. Then there will be no waste and every dollar extra means more production. We can fit out any grove from sap spout to Champion Evaporator. Get in touch with us right away.

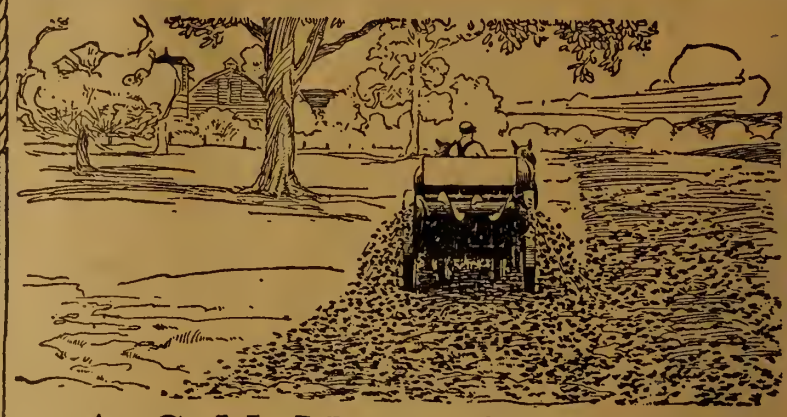
154 Old South Bldg, Boston, Mass.



A Gold Mine of Fertility

MADE IN CANADA

DURING the long winter months your cattle are confined to the stable instead of running loose in the pasture. The manure pile grows. By spring you have a gold mine of fertility stored up behind the barn.

How do you handle that valuable crop of fertilizer in order to get the most out of it? Experience has shown this to be very good advice: spread it with an **International McCormick, or Deering Manure Spreader,** and get 100% crop-producing value through even spreading of finely pulverized manure.

The all-steel beaters of **McCormick and Deering Manure Spreaders** are equipped with square, chisel-pointed steel teeth that tear the toughest lumps of manure into small bits. The position of the beater is somewhat the same as that of an overshot water wheel, so that the pressure of the load against it really helps it along, thereby resulting in light draft. A spiral wide-spread screw just behind the beater gives the manure a second beating and then spreads it evenly at whatever density desired, well beyond the wheels on both sides. Both rear wheels of the spreader are drivers. The apron and wide-spread spiral are driven from one side and the beater from the other.

The same intelligent, responsive after-the-sale service goes with these spreaders as with McCormick or Deering mowers, binders or other machines bearing the I H C mark of quality and dependability. Let us mail you a catalog of a spreader that will appeal to your common sense and good judgment. Write to the nearest branch house. And call on the International agent when you are in town — he will be glad to tell you more about these spreaders.

NEW WHITE TOMATO

---ALBINO---

This novelty came as a sport, but comes absolutely true from seed now. The fruit is quite large, averaging nearly three-quarters of a pound each. Its color is absolutely white clear through; is most valuable for table use, and as it contains no acid, it will become very popular, for thousands of people do not care to eat tomatoes because of the acid. The flesh is solid and firm, and on this account makes a splendid shipper. No garden will be complete without this valuable addition. Sold in packets only. Per pkt. 30 cts.

FREE—Our handsomely illustrated 116 page catalogue of Vegetable, Farm and Flower Seeds, Plants Bulbs, Poultry Supplies, Garden Implements, etc. for 1920. Send for it.

DUPUY & FERGUSON

38-42 Jacques Cartier Sq., : MONTREAL

acted in several of the provinces forbidding such spraying.

It is, however, seldom found necessary to enforce these laws because there is every reason why the fruit growers should, in their own interest, avoid the spraying of tree in full bloom, and when such spraying is done, it is usually done in ignorance of its harmful effects. Not only are the bees, the fruit growers' best friends, killed, but also the spraying actually injures the reproductive organs of the blossoms and the setting of the fruit. Besides, there is not a pest that demands spraying during the short period that the tree is in bloom. A spraying before the petals open when the buds are showing pink at the tips, and another after the petals have fallen, fairly control everything. The green apple bug, one of the most difficult insect pests to control, is bet dealt with in this way, so also are fruit worms and bud moths. The latter spray controls the tussock moth, and codling moth is best controlled by spraying the calyx cups within ten days after two-thirds of the petals have fallen.

It has already been noted that varietie flowering at the same time should be planted together to insure fertilization. There is another reason why this should be done. It permits a particular spray to be carried out compietely at one time without injury to the blossoms or bees.

THE MARITIME DAIRY SCHOOL

The dairying business is arriving at its own at last. Both production and market value took a big bound forward last year. Two main lines of endeavour point the way to a vastly greater success in the future. 1. The increase of milk production per cow, and, 2. Improvement in the quality of manufactured products. Every owner of a dairy herd must be constantly on the alert along these lines, adopting the best methods and picking up the latest information.

The yearly opportunity to "keep-posted", for Maritime dairymen is now at hand. The Maritime Dairy School will open at the College of Agriculture, Truro, on March 10th. The first fourteen days are arranged especially for creamery men, the last eight for cheese-makers. Concurrently with both there will be instruction given in cow testing and the use of the tester.

Lectures and demonstration work in the judging of dairy cattle, the prevention and treatment of disease, etc., will be open to all Dairy students, in short, the squipment and teaching facilities of the College as a whole are available, in so far as there will be time to take advantage of them. The College Dairy herd, probably the finest in the Maritime Provinces, will give practical opportunity for selection and judging. Results obtained at exhibitions and contests go to prove that the instruction to be had at the Maritime Dairy School is second to none in Canada. A larger attendance than usual is looked for this year. For full information write to Mr. W. A. MacKay, Agricultural College, Truro, N. S.

The pullets should all be laying by this time. Better results will be secured where they are separated from the hens. They should also be supplied with plenty of nests, as pullets are likely to lay on the floor when they first begin laying if nests are not convenient.

DOMINION TIRES
ARE GOOD TIRES

Get There First

Don't wait until you are ready to drive your car before ordering new DOMINION TIRES.

The next time you are in town, go to your dealer and select the new tires you need. Then everything will be ready when you want the car for farm hauling or for pleasure.

DOMINION TIRES are *good* tires for every load and every road; and you have the choice of "Nobby"—"Chain"—"Dominion"—"Grooved" or "Plain" Treads.

Remember to get an extra DOMINION INNER TUBE, that will fit the Dominion Tires—and you'll need TIRE ACCESSORIES, too, to fix the little cuts, bruises and holes in the tires, and thus make them last much longer.

DOMINION TIRE DEALERS also carry Dominion Inner Tubes and the complete line of Dominion Tire Accessories.

FIELD EXPERIMENTS

(Continued from page 370)

Autumn Versus Spring Plowing

There are so many different soils to plow, and so many kinds of plows to plow them with, that no definite rule can be laid down as the best method for all solis.

We plow to bury vegetation and manure so that they may decay and feed the future plants. We plow to pulverize the soil and fit it to receive the seed. No other implement will do so much in one operation toward the making of an ideal seed bed, as a good plow in skilled hands.

We plow to decrease the water holding capacity of the soil. We plow to destroy weeds, insects and rodents.

Why Should We Plow in the Autumn?

Because this comparatively slow operation can be performed more economically when horse and man power are not at such a premium as they are during the rush of spring seeding. Early autumn plowing enables the heat from the September sun to hasten the decomposition of one season's refuse plant growth so that it may be feed the succeeding one. Late autumn ridging with a plow greatly benefits many soils by exposing the greatest possible surface to the action of freezing and thawing, nature's most wonderful pulverizer, which has made most of the seed beds throughout the ages, and is today our greatest agent in producing the tilth so necessary for large crops. In the autumn a dry soil may be plowed without causing the same injury that would follow plowing a soil in that condition in the spring. It is also possible to plow land so wet in the late autumn that there is a gloss or sheen from the mould-board, knowing that the frost of winter will turn what would make clods at other seasons, into mellow seed beds in the spring.

Soils That Should Be Left and Not Plowed Until Spring

Light soils that blow, and soils on steep hill sides that wash, should not be exposed to the gales and heavy rains of winter and early spring. Some heavy clay soils that puddle during the heavy spirng rains are better and plowed when they have reached the right degree of friability to crumble under the mould-board.

Land That Rarely Needs the Plow to Prepare It

Land that has produced a hoed crop such as potatoes, turnips, mangels or vegetables, usually produces a better crop if the seed bed is formed for the following grain crop without using the plow. Ribbing in late autumn has been the only use of the plow that has increased such crops at Charlottetown.

Experimental Data

A few results from cultural experiments at Charlotteown, that bear directly on this problem, are of interest. The figures secured are from average yields covering four seasons from fields of oats on a comparatively level, sandy loam soil. Sod plowed in August gave 47 bushels and 14 pounds; sod plowed in November (no other autumn work), 42 bushels and 32 pounds; sod plowed in spring, 34 bushels and 9 pounds. Loss from spring plowing compared with August plowing, 13 bushels and 5 pounds; compared with November plowing, 8 bushels and 23 pounds. There were 45 plots in this particular five year rotation, and the spring plowing of same aveaged 6 bushels below the poorest method of breaking sod. Therefore plow your sod in the autumn, and as much of your stubble as you can. Leave your land after a hoed crop without plowing, except to rib it up. In connection with this subject, we have run a series of plots plowed at different depths, with and without a subsoil attachment. Sod and stubble were plowed at the following depths: 3 inches, 5 inches and 7 inches; other plots of sod were plowed these depths and then subsoiled 4 inches in the bottom of each furrow. Subsoiling did not give us any appreciable gain at any depth and was evidently injurious when connected with 7 inch plowing, as these plots showed a loss averaging over 2 tons of turnips per acre. In the stubble land the average return for four years with oat plots were as follows:

Autumn.—3 inches deep, 42 bus., 26 lbs.; 5 inches deep, 44 bus., 30 lbs.; 7 inches deep, 41 bus., 30 lbs.

Spring.—4 inches deep, 39 bus., 3 lbs.; 6 inches deep, 39 bus., 29 lbs.

In this experiment the average yield in favor of autumn plowing of sod was 3 bushels and 19 pounds of oats per acre.

One of the experiments that lends itself best to demonstration purposes included aseries of plots known as "Seed Bed Preparation" starting with one stroke of the spike tooth or smoothing harrow before seeding and gradually increasing the amount of work until the eleventh plot was worked as follows:

Once over with the disc harrow, then once over with the disc harrow again, followed by the smoothing harrow, rolled, seeded with disc seeder and finished with the smoothing harrow.

A photgraph would show these plots just rising up as steps some seasons when condition are unfavorable for grain crops and shows clearly the advantage of good tilth for our crops.

Increase Your Grain Crops without extra land, labor or seed

IT'S purely a question of supplying more—and better—fertilizer. This is not theory. It is FACT. Grain needs nitrogen or ammonia to grow the straw; Phosphoric Acid to hasten ripening and fatten the kernel; Potash to give strength to resist disease and assist in the formation of starch. Harab-Davies Fertilizers possess these plant foods in readily soluble form—the identical plant foods that are supplied to the soil by barn-yard manure, but in larger quantities and in more concentrated form. Experience is the great teacher. There is no substitute. Read, then, of the experience that scores of Farmers in all sections of Canada have had in greatly increasing grain yields with Harab-Davies Fertilizers. "Fertilizer Results by Satisfied Users" is the title of a most interesting booklet along this line. Write for a copy—sent FREE on Request.

EARLY RIPENING BEANS

(Experimental Farms Note.)

While beans have long been grown and appreciated in certain parts of Canada for table use both in the green state and in the form of the ripened seed, this crop has not been as extensively cultivated as would be desirable. One of the principal difficulties in the way of the more extended production of ripe beans is the sensitiveness of the plants to frost. Ordinary beans cannot be ripened in any district where the season is very short. There are, however, some sections of Canada where the cultivation of beans for the ripe seed is almost unknown at present and where, nevertheless, this crop would likely prove successful, provided suitable varieties were tried.

With a view to extending the use of ripe beans for human food the Dominion Cerealist is distributing this winter, for the first time, samples of a productive and very early-ripening field bean. As this variety is brown in color and as it does not perhaps give as heavy a yield as some of the later-maturing white sorts, its cultivation is not recommended for districts where the more popular varieties can be grown. Farmers in almost any part of Canada where ordinary beans fail to ripen would do well to apply for a somple of the beans now offered. The variety in question is a selection from a sort obtained years ago from Norway. It is being introduced under the name "Norwegian, Ottawa 710." While the number of samples available is necessarily limited, it will be possible to send a few, at least, to almost every district where they are likely to be of use. Applications from farmers in localities where beans are already a successful crop will not be filled but requests are invited from farmers who have not yet found a variety which ripens sufficiently early.

Although these beans are of a brown color, they are excellent when cooked and there is no reason why they should not give complete satisfaction for table use, even though their color be not fashionable. They are not recommended for use in the green state.—C. E. Saunders, Dominion Cerealist.

OUT-APIARY MANAGEMENT

(Experimental aFrms Note)

The tendency of modern beekeeping is to specialize. One hundred colonies is about the largest number that can be kept with full profit in many places, but an experienced and active man can attend double that number, especially if he has a little help, hence the development of the out-apiary. The place chosen for the out-apiary should be in a good locality for honey plants (clay or limestone soil is best for clover) and it should be not less than two or three miles from the home-yard. Other things to look for in choosing a place for the out-yard are, shelter from wind, especially if the bees are to be wintered outside freedom from floods, safety from bush fires, a good road between the two yards, and no large or diseased apiaries near. An outhouse for storing equipment and extracting the honey is convenient but not always essential because the extracting can often be better done at the home-yard. An auto with trailer, or a light auto truck for transporting hives and supplies, is of great service.

To discourage swarming, extracted-honey should be produced in preference to comb-honey, and plenty of supers, containing empty combs, should be given to the bees in advance of their requirements.

In southern Ontario where swarming can be controlled without much trouble, and the climate is mild enough for wintering bees outside, the professional beekeeper frequently keeps one or more out-apiaries, but in many parts of Canada where the problems of swarming and wintering are more acute, the out-apiary is still in the experimental stage, although, in some of these places, very high yields of honey are to be obtained.

To discover how much honey could be obtained, and how many visits would be needed to prevent swarming in different kinds of locations, a few colonies from the Central Experimental Farm have been placed during the last three summers in different places around Ottawa.

In 1917 two colonies were placed on a sandy plain and two in a swamp, near Kazubaza, Que., about forty miles north of Ottawa. Those on the sandy plain gave 109 pounds of honey per colony, spring count, principally from blueberry, white clover and certain species of goldenrod. Those in the swamp gave 139 pounds from the same sources. Swarming was prevented by the destruction of queen cells which were found in one or more of the colonies every week from May 24 to August 14. The making of these twelve visits and carefully examining every hive at each visit consumed a great deal of time.

In 1918 two colonies were placed near an area of fire weed near Chelsea, Que. They produced an average of 239 pounds of honey each from raspberry, clover and fireweed, and required ten weekly visits for the destruction of queen cells to prevent swarming.

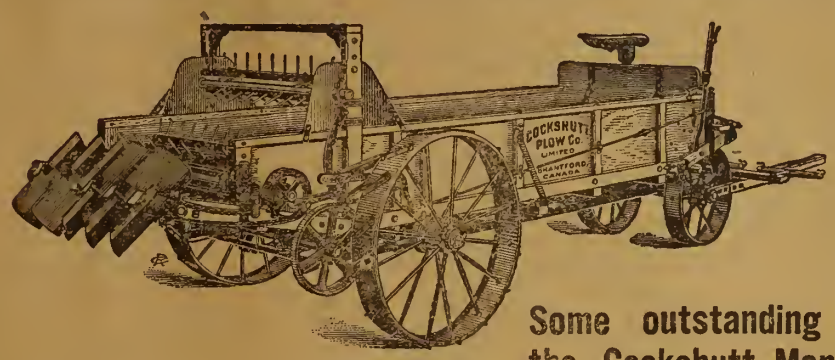
In 1919 two hives were taken to a farmer's garden at Billings Bridge, Ont. To reduce the labor in preventing swarming and to get a maximum yield, two queens separated by a division board had been wintered in each hive. One of the queens and her bees was placed in a separate hive on May 27. In this way a great number of bees were raised in time for the honey flow in this favorable localitq, and early swarming was prevented. Later swarming was prevented and young queens were obtained (two in some of the hives) by three further manipulations: the destruction of queen cells in some of the hives on June 16, the destruction of queen cells and removal of the queens in nuclei on June 24, and, nine days later, the destruction of all the queen cells except two, one on each side of a division board then inserted. Each hive, spring count, produced an average of 331 pounds of honey consisting of 290 pounds of clover honey and 41 pounds of buckwheat honey, and there was an increase in bees of three hives.—F. W. L. Sladen, Apiarist, Dominion Experimental Farms, Ottawa, Ont.

Where are you putting the manure from the stables?

COCKSHUTT

Cockshutt Manure Spreader

Gets the manure on your land as it should be—evenly spread and just when it does most good



You must keep up your soil's fertility, and barnyard manure is one of the best fertilizers you can use—but, what a bug-bear spreading has always been—a tough, tiresome job! We've taken all the hard work out of it with this Spreader.

Some outstanding features of the Cockshutt Manure Spreader

When you consider the increased yields other men are getting by properly manuring their fields you'll be just as quick as we are to say that an efficient spreader is an absolute necessity on every farm and one that will very quickly pay for itself.

Light draft, simplicity of parts and ample margin of strength, are notable in the Cockshutt Manure Spreader. Mark that word "Spreader" it means something vastly different from a mere "unloader." The Cockshutt has three distributing cylinders that pulverize the manure to a fine degree and then *spread it evenly* over a wider area than the machine's own width.

Let us send you our special Manure Spreader Folder.

Box, frame wheels very strong without surplus weight.

Easy loading—top of box just 41" from ground—ample clearance 17" underneath.

No gears to break or freeze up. Chain drive, the strongest known, is used.

Easily worked levers, convenient to driver, control the operation of the machine.

Bottom of box is stationary. Manure is moved by endless chain carriers with heavy steel angles. No aprons, slats or rollers to get foul or broken

Front wheels set in under frame, allowing short turns; hitch is close to ground.

Seat tips forward out of way during loading.

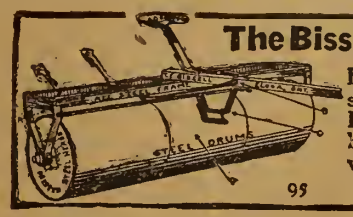
APPLE SHIPPERS ASSOCIATION HOLDS MEETING AT KENTVILLE

The Apple Shippers' Association composed of the principal shippers in the Valley, with Mr. W. H. Chase as President, and Mr. Herbert Oyler, Secretary, met at the offices of United Fruit Companies at Kentville, on Monday, Nov. 17th. The special object of the meeting was to make an effort for a a reduction in the ocean freight on apples.

Messrs. W. H. Chase, A. E. McMahon and Herbert Oyler were appointer a committee to deal with the matter of a reduction in freight rates.

When father drove old Dobbin, he set upon his load and frowned on every chauffeur who wanted half the road. When father got an auto, his feelings seemed to switch. He glared at every horse he met unless it took the ditch.



The Bissell Steel Roller has a rigid steel frame—no wood whatever. Large roller bearings and strong 2" axles insure durability and great strength. The Bissell is a 3-drum Roller of good weight, built to stand hard usage and give great service. Write Dept. M for free catalogue.

MARITIME FARMER STAND FOR EAST IS ENDORSED

(Continued from page 371)

than they would have from some of the visionary importations who addressed the various meetings.

It is in view of these things that we point out to the farmers of Eastern Canada the strong advisability of organizing in their own interests. The Grain Growers are establishing a paper to inflict upon the farmers of the Maritime Provinces the views of Winnipeg. It is represented to the farmers as being "their paper". It isn't. It is controlled from Winnipeg, and it will say what Winnipeg wants it to say. The director of the paper will be Mr. G. F. Chipman, who is an employee of the Grain Growers' Guide. The Grain Growers' Guide is the mouth-piece of the very men who ask that the farmers in this part of Canada be soaked for their feeds and their flour. The Grain Growers' Guide also professes to be owned by farmers. It is owned by Hon. Mr. Crerar and one or two others. The farmers share is represented by his subscription. In the same way every reader of the Maritime Farmer is a part owner. Mr. Chipman will run the new paper as he is told to run it. He will advocate western ideals, properly coated for eastern consumption and will try and gold-brick to a still greater extent the farmers of Eastern Canada.

The Maritime Farmer would like to see a purely Maritime Province organization, run in the interests of the farmers of the three provinces. It would like to see an organization which will be of the farmers, for the farmers and by the farmers; but we mean Eastern farmers.

We commend to the attention of Eastern Farmers the views of Mr. Pratt, of the Grain Growers Guide, which are published in a panel on this page. What are the ideals which Mr. Pratt of the United Farmers of the West would impose on the farmers of the East?

He used strong language. Until the last dollar goes, he declared, the United Farmers of the west, (not the east mind you), will see that their paper survives. There must be something big at stake to pledge so much. The Grain Growers Guide is in itself a very wealthy corporation. Back of it Is the Grain Growers with a two million surplus. What is it that they would introduce into these provinces which makes it worth while to pledge such large funds? People do not risk fortunes for fun and the history of the western Grain Growers, as shown by their surplus, is not along the line of good fellowship. We ask again what has this organization in view? Is the Maritime Farmer not warranted in its "Beware"?

Get together. But get together in our own interests, (eastern interests), is the warning the Maritime Farmer again issues.

And the Maritime Farmer is not the only doubter. President Wood, of the Alberta United Farmers, roundly denounced their methods at the Convention of this year. He declared that he was told that he must say from the platform nothing but what he might be told to say by the political committee. Mr. Wood was a big enough man to refuse to swallow the dose. He was re-elected President.

On Thursday, February 12th, during the annual United Farmers' convention at Saskatoon, the Secretary, J. B. Musselman, declared point blank, charged the Association with being the catspaw for a clique who were out to further their own political ends, and warned them that their attitude was placing the Association in an absolute state of chaos.

These are charges by the President of the Alberta branch and the Secretary of the Saskatchewan branch. They are not remarks by the Maritime Farmer. If they won't stand for game in the west?, why should the farmers of the Maritime Provinces tie up with a movement which is to their own disadvantage. Let us have all the United Farmers that may be, but let us run our own machinery. It is quite unnecessary, to quote Secretary Musselman, for Maritime Province farmers to be "catspaws for a clique who are out to further their own political ends."

BRITISH COLUMBIA
RED CEDAR
SHINGLES

No known wood meets the demands of weather exposure as does Red Cedar. No Red Cedar in the world excels in quality the stand in the British Columbia forests. It is from this growth that B. C. Red Cedar Shingles are made.

Longest Life at Lowest Cost

STANDARDIZING CANADIAN BUTTER

The Provincial representatives who were present at the Dominion Educational Butter Scoring Contest in Montreal could not escape certain impressions regarding the progress of dairying in Canada. A big change has taken place in the quality of creamery butter. An article which would have passed ten years ago as being of the finest quality would not be passed at all today by a close critic. The development which has been pushed forward all over the Dominion has accentuated differences in quality and flavor between east and west. This competition brought the men together and gave them an opportunity of making close comparisons between their respective products. As it goes on, a medium will be established through which pro-standard Canadian products can be offered to foreign markets.

While this contest as not conducted with any idea of getting one area against another, and while no prizes are being awarded to the competing creameries, yet it will be interesting to dairymen to note how they compare. The comparison should be encouraging to the Maritime Provinces, which, at present are scoring as high as any district in the Dominion. In the last test, the highest score was reached by a Prince Edward Island Creamery with 98 points. The other provinces stand in the following order:—Quebec, 97.8; Nova Scotia, 97.5; Manitoba, 97.2; Alberta, 97; New Brunswick, 95.6; Saskatchewan, 95.2; British Columbia, 94.4; Ontario, 94.

The competition will be carried on during 1920, and it will be followed with great interest by dairymen in all the Provinces.

"The Safety Route From Pig-hood To Pork-age"

BLATCHFORD'S PIG MEAL

A complete milk-substitute weaning and growing feed.
Helps the little pigs just when help is needed.
A safe and gradual change from the sow to ordinary feed without the use of valuable cows milk.

Royal Purple Stock and Poultry Specifics and Foods

In the manufacture of all our Stock and Poultry Condition Powders and Remedies we eliminate the cheap filler which is used by many manufacturers to make up a large package, and give you pure material which you can adulterate yourself if you wish. Mr. Farmer, how does this appeal to you?

Royal Purple Stock Specific

is a pure unadulterated condition powder, it is not a dope. It can be used throughout the entire feeding season and will not do your animals one iota of harm, works entirely on their digestive organs, causes them to assimulate the foods properly and digest every particle of food value. Fifty-five to sixty per cent. of food value is a fair average of what the animal takes out of its food without this condition powder: it makes their coats sleek and causes them to take on a healthy appearance in a very short time.

What We Claim For It

Cows will give from three to five pounds more milk per day during the winter months. You can fatten pigs a month earlier, have larger and better pigs and save a month's time and feed. You can fatten horses ready for sale in four to six weeks. If you don't believe us try a 60c package on the worst animal you have on your place and be convinced. How many times have you said to yourself, "No matter how much I feed my animals they do not seem to thrive." This, Mr. Farmer, is because your animals are not in a healthy thriving condition. Royal Purple Stock Specific will compel them to put on a thrifty appearance in a short time and yet it will cost you less than 15c. per month per animal to use it. Put up in 60c. packages, $1.75 and $6.00 tins. If you have a lot of stock buy the large tin. It contains sixteen 60c. packages.

PURE BRED STEER under 1 year, entered in Lot No. 3, Toronto Fat Stock Show, Union Stock Yards, Toronto, Ont., Dec. 11-12, 1919, and awarded 1st Prize. Also entered for Royal Purple Calf Meal Special, and awarded 1st Prize. Fed and Exhibited by Mr. Oril Williamson, R. R. No. 1, Jarvis, Ont. Sold for 33c. lb. by Auction. Weight, 1190 lbs.

Royal Purple Laying Meal

During the many years we have been making our high-class Stock and Poultry Specifics, we have had thousands of letters from Poultry raisers all over Canada, wanting to know what to feed their poultry. A hen is just like a factory. If you have lots of material in your factory, you can get out the finished product. The hen requires so much Protein, so much Fat, Ash Lime, etc., to make an egg and supply her bodily needs. Ordinary grains will give her a supply for herself and to make one egg every two to three days. For the accommodation of our customers, we have produced a Laying Meal which contains high-class meat meal, grains, etc., that will give her everything she requires for her bodily needs and produce an egg per day. If you cannot get this material from your dealer in your own town send us $5.00 for a hundred-pound bag and we will ship it to you direct. This product certainly fills a long felt requirement for the poultry man and simplifies the matter of feeding.

MANUFACTURED BY

W. A. Jenkins Mfg. Co., Limited

LONDON, ONTARIO

Royal Purple Meal Calf

There is probably no mixed feed on the Canadian market that the farmers have been buncoed more on than Calf Meal. You cannot make a substitute for milk with less than 10% Fat or over 20% Protein. Calves are entirely different from grown animals. You must supply them with material as much like milk as possible. In our Royal Purple Calf Meal we have a product on which you can raise calves after they are eight days old just as well as though you used new milk. At the Toronto Fat Stock Show this year there were eight calves shown not over a year old that averaged over one thousand pounds each, that were fed on this meal. If you will write us for our new booklet we will send you the full particulars and photographs of all these calves. Mr. Farmer, when you want calf meal you see that it contains over 10% Fat. Unscrupulous dealers and manufacturers are making meals that do not contain more than 7% fat and a large percentage of protein. Many of these meals are no better than ordinary dairy feeds. Fat costs two and a half to three times as much as protein in any market, but you must have it in calf meal to make a substitute for milk. Our Royal Purple Calf Meal is put up in 25, 50 and 100-lb. bags.

Royal Purple Poultry Specific

If your hens are not laying after the first of January it is because they are not housed properly and are in an unhealthy condition. There is no excuse for hens not laying if they are fed and housed properly. Our Royal Purple Poultry Specific, if used in the mash given them, will make them digest their food properly, make their digestive organs healthy and active and will produce the eggs for you as well in the winter as in the summer. The eggs are formed in batches from ten to fifteen, from the large egg down to the size of a pin head. If the hens are not healthy nature will lie dormant. As soon as our Poultry Specific is used nature becomes active. This is why so many people get eggs in a few days after using our Specific. If you do not get eggs it is your own fault. This Specific is put up in 30c and 60c packages $1.75 and $6 tins.

Royal Purple Chick Food

made from all kiln dried white grains. You can raise 95 to 98% of your young chicks with this food, put up in packages and bags.

We also manufacture the following valuable brands:

Royal Purple Lice Killer in 30c and 60c. tins.
" " Cough Cure in 60c. tins.
" " Sweat Liminent in 60c bottles.
" " Disinfectant in 35c., 65c. and $1.40 tins.
" " Roup Cure in 30c. and 60c. tins.
" " Worm Powder in 30c. and 60c. tins.

Every article we make is guaranteed to do exactly as represented.

For Sale by reliable dealers everywhere. If you cannot get any of the above articles from your dealer write us direct.

FREE Write us and we will send you one of our new books that are now being published, giving you all the common diseases of stock and poultry, how to treat them how to build a hen house, and wilderness of valuable information.

LIME AS A SOIL IMPROVER

Failure to produce good crops may result from a lack of the essential elements of plant food—nitrogen, phosphoric acid, potash, or because of unfavorable weather conditions disease or insects; but even with good culture, and with all requirements for a successful crop apparently met, the crop may be an economic failure because of the lack of limestone in the soil. More failures probably can be attributed to this lack than to any other single soil condition.

It is a well recognized fact that the basis of successful crop production centers around the clover plant. Failure to produce a good stand of clover may mean ultimate failure in farming operations. It is to insure a perfect stand of clover that lime is so important on very many farms.

Limestone wil not take the place of the essential elements furnished in stable manures and commercial fertilizers and it should be used in addition to these. Limestone corrects soil acidity so objectionable to the clover, furnishes a base essential for the development of food combinations suitable for the clover plant, supplies needed lime to the plants, and improevs the physical condition of the soil. That such is the case is amply demonstrated by many tests conducted at the Experimental Station, Kentville, where clover cannot be successfully grown without limestone, and where clover hay yields have been increased nearly 100 per cent. by an application of 2 tons per acre, all other conditions being similar, and subsequent crop yields increased nearly 25 per cent. because of this increased clover growth.

The clover plant benefits the soil for all future crops not only through improved mechanical soil condition resulting form the network of deep feeding roots decaying, but by furnishing nitrogen which has been extracted from the air in the soil by the nitrogen-fixing bacteria living on the roots of the clover plant which will flourish only on acid-free soils; not only will heavy soils be lightened and be made more drought-resistant, but light soils will be made more compact and rendered more retentive of moisture. Further, better aeration and more suitable soil condition for soil bacteria are brought about.

To illustrate the improvement, we may instance one series of plots where ground limestone was applied in 1914 aid 1917 at the rate of 2 tons per acre in the spring of these years and worked into the soil. Fertilizer was applied in 1914 and 1917 in equal amounts to each plot and, in the fall of 1916, 15 tons of good stable manure was applied evenly over both limed and unlimed areas. The area was rotated with potatoes, grain, clover. The soil was a sandy loam in a low state of fertility. The yield per acre was as follows:—

1914, potatoes, 76 bushels, 13 lbs.
1915, oats, 31 bushels, 24 lbs.
1916, hay, 666 lbs.
1917, potatoes, 302 bushels, 25 lbs.
1918, whteat, 23 bushels, 48 lbs.
1919, hay (largely timothy, first crop) 3,136 lbs.

The yield from the limed fertilized area was:

1914, potatoes, 86 bushels, 45 lbs.
1915, oats, 38 busels, 14 pounds.
1916, hay, 1,494, lbs.
1917, potatoes, 329 busels, 18 lbs.
1918, wheat, 30 bushels, 14 lbs.
1919, hay, (largely clover, first crop) 4,926 lbs.

There is a heavy stand of second growth clover on the limed area and a very light growth on the unlimed plots. The increase from liming was 38 bushels, 25 pounds potatoes, 7 bushels, 24 pounds oats, 6 bushels, 26 pounds wheat, and 2,618 pounds clover hay per acre.

From present indications more marked results will be obtained in future crops, as the physical condition of the soil has markedly improved.—W. S. Blair, Supt., Experimental Station, Kentville, N. S.

SEED OATS SITUATION

In those districts where the oat crop was a partial or total failure last season, farmers are becoming somewhat anxious as to the available seed supply of seed oats. There is a general tendency on the part of farmers who have seed oats for sale to withhold them until later in the winter. The movement of seed oats is delayed also because transportation has been needed for coal, feed and livestock.

Possibly 400,000 bushels of seed oats may be required in Ontario and Quebec, and a much larger quantity in Southern Alberta and Saskatchewan. The Canadian Government Seed Purchasing Commission already has substantial supplies in store in the Interior Terminal Elevators, and large quantities of good-quality early-harvested oats are still to come forward. Alberta and Saskatchewon requirements swill be given first consideration from the seed oats produced in these provinces.

The shortage in Ontrio and Quebec may easily be met from the large and excellent oat crop in Prince Edward Island and Eastern Nova Scotia. No. 1 quality Island Banner seed oats are now being delivered as far west as Toronto at a price comparable with Western seed oats of the same grade. The price of No. 1 seed oats delivered in bulk carlots at any poit in Ontario and Quebec should not exceed the current Fort William cash price for No. 2 Canada Western oats by more than 35c. per bushel. Registered and other select stock true to variety may be higher in price.

The Dominion Seed Branch provides a system of grading and inspection, so that shippers in either Western Canada or the aMritime provinces may make delivery of seed inspection certificates with their bills of lading. Purchasers of seed oats in any part of Canada may now buy on the basis of grade No. 1 Seed, No. 2 Seed, etc., and subject to the delivery of seed inspection certificates.—Geo. H. Clark Seed Commissioner.—Otawa, Dec. 31.

RUST AND ROT HAVE FREE PLAY

Never in the history of the world was farm machinery as expensive as at the present time. The upward climb in prices has been in progress for many years, and now they have reached unheard of values. There are many people who claim that the prices charged are uncalled for and suggest ways of reducing their cost, but, on the other hand, the manufacturers and dealers maintain that the prices are not excessive and blame the increased cost of raw materials and the war. Just at present it would apepar that the war makes a splendid shelving ground for all the ills of the country's commercial life.

Nevertheless, whether the prices asked are justifiable or not, they are higher than ever farmers have previously been called upon to pay. Grain binders that could be bought a few years ago for less than a hundred dollars command more than double that amount this year, and so on all the way down the line. An ordinary farm wagon that formerly was not considered a huge investment today entails the expenditure of a lot of money. Then, in addition to the increased prices, there is the fact that farmers must own larger and more detailed machinery than ever before; all of which goes to swell the farmers' implement bill.

While this is the case, it is still a common spectacle to see throughout the country farm implements stored in the fence corner, under a tree, around the farm yard, and in some cases just where they were unhitched from last time in use, perhaps months ago. That should not be, because farming today, even at the high prices received for produce, is not sufficiently remunerative to warrant such carelessness and waste of money. If the life of any implement can be prolonged a few years by good care and proper shelter, it certainly is cheaper to give it that care than to buy a new one at the prices now asked. It does not require much time to store farm implements in the shed, and there are few valid reasons why it should not be done. A wet day is all right for the job and a profitable rainy day undertaking. We would suggest that farmers pay a little more attention to the care of their implements. There are mowers, rakes, hay loaders, etc., in many fields throughout the country that are still standing where they were left weeks ago, and their owners are probably waiting for a favorable opportunity to store them away. Their intentions are good, but the time is passing and implements mean money today if they ever did. Organize a clean-up day soon on the farm, and dollars are saved to the industry.

CHIMNEYS SHOULD BE WELL CONSTRUCTED

Many times when a furnace, heater or range fails to give full satisfaction the trouble lies with the chimney and not with the apparatus, where most people usually look for it, unless they have had previous trouble in such matters. Chimneys are often slighted when houses are built by contract because the work is mostly hidden from sight.

In order that a heater or a range may give good service, there must be a constant and uninterrupted draft from the openings in the apparatus to the top of the chimney, created by the winds sweeping across the chimney top. Now chimneys are very generally constructed with two flues, and the partitions between these flues ought to be built as carefully as any other part of the chimney. As a matter of fact the flue partitions are often constructed most carelessly, perhaps the workmen do not realize the importance of having them properly built. Openings may be left, or bricks may be placed in position so loosely that several fall out after a time. Then the draft is interfered with, for the air is drawn through these openings instead of directly up the flue.

90% No. 1's!
Isn't it worth a little extra time and money to be sure of trees bearing like that on the left?
Trees such as that on the right, left to the mercy of insects and fungous growths, are a luxury none can afford these days.
Ensure a big and profitable yield by careful spraying with reliable and economical J. C. sprays.

It's a Fact-You Know
Every Farm Needs Fertilizers

Try as you will, you cannot get bumper crops from your soil if you don't fertilize it. There is no mystery about this. It simply means that, as soil gets worn out, Fertilizers must replace the elements that have been used up.

"Best-by-Test"
FERTILIZERS

Best-by-Test Fertilizers have full analysis strength—guaranteed. Write us for particulars and we will advise the kind of Fertilizer to order. We are exclusive Fertilizer experts and can supply all and every chemical required. Farmers can club together and buy in carload lots. Prices on application.

Write for interesting book on Fertilizers—FREE.
CANADIAN FERTILIZER CO., LIMITED

The extent of the inerference depends of course upon the conditions, but it may be sufficient to cause serious difficulty in the management of the heater or range that connects with the chimney.

There is often trouble if a fire-place is connected with a flue into which a pipe from a stove or range leads. This may be remedied, however, by having a damper installed in the throat of the fire place. When the latter is not in use the damper should be kept closed, so that the upward current of air will be drawn from the stove or range instead of from the room into which the fire place opens. When there is a fire in the fireplace, less difficulty is experienced, but the wiser plan is to erserve the flue solely for the fireplace.

Fireplaces which smoke are commonplace, even in some houses otherwise very well designed and constructed. Often this defect may be remedied by making the chimney a little higher, or by capping it with a hood, which is generally very effective, if the smoking occurs when the wind is form a certain quarter.

Occasionally lack of fresh air in the room is the cause of smoky fireplaces. This may happen if the fire place is too large for the room, and the remedy for the condition is to construct a small flue from the basement to the fireplace, then supplying an abundance of fresh air thereby creating a good draft upward.

In other instances there are fundamental defects in the construction of the throat of the fireplace. They can only be righted by tearing out some of the bricks. In a case of this kind which recently came to the writer's notice $5 was the cost of changing a fireplace which smoked badly into a good one.

THE DESTRUCTION OF RATS ON THE FARM

(Experimental Farms Note.)

The annual loss on Canadian farm homesteads due to the depredation of rats have never been estimated, but they must amount to tens of thousands of dollars. There are few farmers in Eastern Canada who do not suffer from the ravages of this destructive rodent and unfortunately having invaded the prairie provinces this pest is now rapidly spreading westward.

There is nothing eatable ,animal or vegetable, that the rat will not attack and it will "destroy by pollution ten times as much as it actually eats." On the farm, grain of all kinds, vegetables and friuts, eggs and poultry, constitute the chief objects of its foraging. It is omnivorous, voraceous, destructive and withall very prolific when there is an ample food supply. No one means of destruction is usually successful and recourse must be had to as many of the various agencies of destruction as may be deemed necessary or practicable. We cannot emphasize too strongly the value of persistent effort if the premises are to be rid of rats.

Prevention: This is of the first importance. It is inside the building rather than outside that rats do the most damage; the great object thereofre, must be to prevent their entrance. This is best attained by having all foundations and floors of concrete. From every standpoint concrete so used, for barns, stables, piggery, poultry houses, etc., represents a good investment. Old and dilapidated stone foundations may be made rat proof by an inside coating of concrete, or at times, simply by stopping the holes with a mixture of cement and broken glass.

All basement and cellar windows should be screened with stout metal netting; open windows are of the readiest means by which rats effect an entrance.

Limit their food supply as far as may be practicable by keeping grain, meals, garbage, etc., in rat-proof bins or other receptacles, with close-fitting covers. It is impossible to make much headway in keeping under this pest so long as there is an abundance of unprotected food about the buildings.

The usefulness of the larger owls and hawks in the destruction of rats has not fully been recognized; on the whole these birds if kept in check are beneficial.

A well trained dog may be depended upon to keep the poultry yards fairly free from rats. Probably for this purpose there is nothing superior toa thoroughly trained fox terrier.

Traps: Trapping is one of the most effective means of destroying rats. It fails if food is abundant, especially with old rats, which are very cunning. If the rats are numerous a number of traps should be used at once and used persistently.

There are several modern forms of guillotine trap which are excellent. Cage traps are especially useful in catching young rats, especially if baited and left open for a night or two and partially concealed as by hay or straw. Large catches may frequently be made by "barrel" and 'pit" traps —the baited covers being hinged so as to turn with the weight of a rat. Among excellent baits may be mentioned toasted cheese, bacon, liver, raw meat, grain of various kinds, oatmeat and in winter fresh vegetables.

Poisons: As there is always more or less danger to live stock in the use of poisons, they are the last means to employ. Barium carbonate (precipitated) is the least dangerous; it is comparoatively harmless to domestict stocks in the small doses used for killing rats. It is used as a stiff dough, composed of flour or oatmeat and a little sugar with 15 to 20 per cent. of the carbonate. The addition of a few drops of oil of aniseed or of caraway makes the bait more attractive. Asenic is very popular as a rat poison but experience has shown that it is variable in its effect and aparently not always fatal. The bait can be made as already described under carbonate of barium, or the arsenic may be spread or rubbed on buttered bread. Strychnine is also employed and is very rapid in its action. The best plan is to insert a small crystal in raw meat, the pieces of meat being placed in the runs or burrows.

In buildings or yards in which there are poultry or other live stock, a precautionary measure in the use of poisons is the employment of two wooden boxes, the one considerably larger than the other and each having two or more holes in the sides large enough to admit rats. The poisoned bait is placed on the bottom and near the middle of the smaller box. By this means danger to live stock is avoided while the rats have free access to the poison.—Frank T. Shutt, Dominion Chemist.

Sour soils and sour dispositions are both bad for the farm. Some men think that a little sweetening of the soil with lime would produce such good results that the farmer's disposition might also be sweetened.

Pride in the Way Your Car is Shod

TO be proud of your car you must be proud of its tires. You look with pride upon the graceful design, the fashionable top, the rich upholstering, the glittering finish—and the tires—are you proud of them? If you love your car, you will desire to give it the best tires in the whole Kingdom of Tiredom. For service and for appearance, you will find your desires fulfilled in Gutta Percha Tires—"the Tires that give Satisfaction."

Maltese Cross Tires, Gutta Percha Tires and Gutta Percha Tubes are the NE PLUS ULTRA of owners of high-powered cars.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

IT IS "NEPONSET" PAROID OR IT IS NOT PAROID

PAROID is not a roofing term for all ready roofings, but is manufactured exclusively by Messrs. Bird & Son and is a member of the great "Neponset" Family, the trade name of all the Bird Products.

"Neponset" is derived from the river of that name, which flows through the town of East Walpole, Mass., where the original Bird & Son plant was established in 1795. Paroid was first manufactured there in 1898, and eight years later in Canada, upon the opening of the Canadian Plant in Hamilton.

The excellence of Paroid, combining as it does great durability with weather-resisting qualities, has made this product of the "Neponset" Family well and favorably known throughout the Dominion; and to those not familiar with its origin Paroid is assumed to be a word meaning all ready roofing. This is not so!

To be PAROID, it Must be "NEPONSET" PAROID

Roofs laid with Neponset Paroid more than twenty years ago are still giving satisfactory service and show no appreciable signs of wear though exposed for all these years to varying climatic changes. Compared with wood or steel shingles, or slate, Paroid is cheaper and costs less to lay.

The base of Neponset Paroid is a high-grade rag felt thoroughly impregnated with asphalt, making it positively water-proof.

Neponset Paroid is made in two surfaces—Talc, grey in color; or crushed slate, red or green in color.

For satisfactory roofing—durability, service, appearance and protection, specify "Neponset" Paroid. "Neponset" is your assurance of quality; it is the hall-mark that stamps all Messrs. Bird & Son Products, and places them in the lead on merit and quality.

There is a Neponset dealer in your district. Write us for his name and a copy of our illustrated booklet "Roofing Canada."

FAIRBANKS-MORSE
"F" Power & Light Plant

40-Light Plant

$495

F. O. B. TORONTO

Also made in 65-, 100- and 200-light sizes

The Ideal Power and Light Plant for the farm, workshop, garage and suburban mechanic

EVERY workshop and garage depends on good light to turn out first class work. Delays, and makeshift repairs invariably occur in dingy shops where feeble light results in careless use of tools. Save time, eyesight, and expense by installing a Light Plant which supplies an abundance of light, when and where you require it.

The "F" Power and Light Plant in addition to light, provides ample power for the grindstone, emery wheel, bench drill, bandsaw, small lathe, pump, or any other light machines.

Direct belted to such machinery the "F" plant engine does the work of a power plant twice its horsepower, supplying current to drive the same machines by individual electric motors. It is sturdy and simple in construction, is self-starting, and can be operated by a boy. Its utility enables every rural family to enjoy the comforts and conveniences of brilliant light, electric current, power, and running water in the house, the barns and other buildings. Considering its low price and its economy in operation it is particularly suitable for the requirements of the farmer and small machine shop and garage owner.

Send coupon to our nearest office and we will be glad to send you full particulars about the "F" Power and Light Plant.

Sussex, N. B.

Subscription price $1 per year.

Produce Butter At Lowest Cost

THEY do so because the owners of them weed out the poor milkers, they house their cows in comfortable quarters, they use modern methods and modern equipment, including the Renfrew Cream Separator.

The Renfrew is chosen by dairymen who have figured costs down to the fine point. They have proven to their entire satisfaction that the Renfrew gets one pound more of butter-fat out of every thousand pounds of milk skimmed. Government Dairy School tests have also demonstrated that the Renfrew gets 99.99 per cent. of butter-fat.

As the average milking cow will give, at least, 6,000 lbs. of milk each year, the Renfrew will get 6 lbs. more butter-fat from each cow in your herd every year. With butter-fat at 60 cents a pound, that means $3.60 more profit from each cow, or a saving of $72 on twenty cows.

The Renfrew makes money and saves money in other ways, too.

It requires little attention—and time is money.

The Renfrew needs oiling but once in three months.

There are no oil cups or places where the oil can leak out on to the machine or on to the floor, and take time to clean up.

The wide open bowl and smoothly polished steel discs are easily and rapidly scalded and rinsed.

The anti-splash milk-can prevents milk splashing out on the floor, and is at a convenient, low height for pouring in milk.

There is nothing cheap about the

Renfrew

Cream Separator

Every part is made of high-grade material, accurately manufactured and carefully fitted. The Renfrew is built to last and give extra years of service. It should last one-third longer than an ordinary separator, which means that it is a 33⅓ per cent. better investment from the standpoint of durability and cost per year of service.

Wouldn't it be good business for you to replace your old separator with a Renfrew and cut down your cost of producing butter-fat?

Write for our Catalog and Dairy School Tests of the Renfrew.

Peculiar Interpretation of Equal Rights For All

Wheat Growers of West got Fifty Cent Advance For Wheat and Maritime Provinces Paid Dearly. Farmers Pay Big End of Bill

"The New National Policy, as laid down by the Organized Farmers condemns Class Legislation. Their policy advocates "equal rights for all, special privilege for none."

This quotation constituted the first lines of an editorial in a recent issue of the Farmers Sun, of Toronto, the official organ of the United Farmers of Ontario.

AND YET!

If the grain growers of Manitoba, Saskatchewan and Alberta have not had "special privileges" during the past year, what class in Canada has? In the first place the price of wheat was guaranteed at $1.75 per bushel. The United States government guaranteed $2.26 per bushel. That meant that the Canadian price would also soar. Nobody objected particularly to this because it was a war measure.

But how did it work out? Canadian wheat was sold to foreign countries by the Canada Wheat Board, an organization appointed for the express purpose of handling the Canadian wheat crop for the benefit of growers, at $2.15 per bushel. It was sold to Canadian mills, on the other hand at $2.30 per bushel, or fifteen cents per bushel more than the foreign buyer could get it for. As it takes four and a half bushels of spring wheat to make a barrel of flour, it cost the Canadian consumer just 67½ cents per barrel more for his flour than it did the man in Greece, Roumania, Serbia, or whoever bought it.

Have you considered what this little 15 cents per bushel meant to the population of the Maritime Provinces, particularly the farmers of Nova Scotia, New Brunswick and Prince Edward Island?

The Dominion government estimates local consumption of flour at about one barrel per head of population. Therefor the consumption and the increased cost for the Maritime Provinces and to the farmers of the Maritime Provinces was as shown in the following tables:

Flour

Total Consumption in Maritime Provinces per year.

Province	Amt. Consumed	Increase	Total
Nova Scotia	492,338 bbls.	@ 67½ cents	$332,318
New Brunswick	351,899 bbls.	@ 67½ cents	237,525
Prince Edward Island	93,728 bbls.	@ 67½ cents	53,151
		Grand Total	$633,109

Total Consumption for Farmers

Province	Amt. Consumed	Increase	Total
Nova Scotia	306,210 bbls.	@ 67½ cents	$206,691
New Brunswick	252,342 bbls.	@ 67½ cents	170,330
Prince Edward Island	78,758 bbls.	@ 67½ cents	53,151
		Total Increase for Farmers	$430,172

Here is a tidy little sum which the farmers of the Maritime Provinces paid for flour in excess of foreign buyers. And for what reason? We suppose it was to make a little donation to the Grain Growers, or to pay for the cost of administering the scheme. Certainly it must have been for one reason or the other. The second reason we may shelve for the cost is excessive. So in order that there might be "equal rights for all, and special privileges for none," the farmers of the three provinces contributed at the rate of $430,172 per annum.

If the "special privilege" stunt had stopped there it might not have been half so bad. But it didn't. In the course of time hard wheat was in demand in the United States, and pressure for a further increase was so insistent from the supporters of the "New National Policy" that hard wheat was given another boost of fifty cents per bushel to $2.80. And mark you this increase did not apply to the wheat of any other part of Canada but the Provinces of Manitoba, Saskatchewan and Alberta, the home of the slogan, "Equal rights for all, special priyileges for none."

Not a wheat grower in Nova Scotia, New Brunswick and Prince Edward Island got one additional cent for his crop of wheat. The advance was absolutely restricted to the hard wheat belt.

The Maritime Province farmer, however, was not neglected. He got his end of the deal by being called upon to pay $2.25 per barrel more for his flour or a tax in round numbers of $1,400,000 per annum, in order that fifty cents per bushel might be added to the price of wheat grown in a limited area of Canada.

Herewith are given figures showing the yearly increase in cost to the Maritime Provinces for flour based on an increase of fifty cents per bushel on wheat, as well as the cost to towns and country districts;

Province	Amt. Consumed	Increase	Total
Nova Scotia	492,338 bbls.	$2.25	$1,107,760
Farmers share	306,219 bbls.	2.25	668,972
Towns share	186,128 bbls.	2.25	438,788
New Brunswick	351,899 bbls.	2.25	791,750
Farmers share	252,342 bbls.	2.25	567,770
Towns share	99,547 bbls.	2.25	223,980
P. E. Island	93,728 bbls.	2.25	211,368
Farmers share	78,758 bbls.	2.25	177,203
Towns share	14,970 bbls.	2.25	34,165

So that the farmers of the Maritime Provinces pay the piper, when an increase of fifty cents per bushel is made in wheat, the neat little sum of $1,413,945 per annum. This of course does not include the increased price of feeds, which will be dealt with in another issue of this paper.

And mind you, the "Wicked miller" cannot be blamed this time. As it takes four and a half bushels of wheat to make a barrel of flour, the exact increase in cost at fifty cents per bushel was $2.25 per barrel. When the order for the increase was issued flour was selling wholesale, at $11.80 per barrel, St. John. It is now $14.05, St. John, just the amount which was paid to the United Farmers of the West, the men who are so strong on professions of "Equal rights for all, special privilleges for none."

And not content with what they have already accomplished, these same persons are getting ready for another excursion to Ottawa for more treatment of the same kind. Let us again repeat our warning to Maritime Province farmers. This whole deal is one for the benefit of the West. The figures published above furnish the strongest reason in the world why the farmers of the Maritime Provinces should unite, not to support but to oppose this rank injustice. There is no reason why special privileges should be accorded the grain miners. We in the East work harder and longer to produce what we do, and if there is any "special privilege" such as has been outlined here, we want our share of it. We want to be represented at Ottawa when this deal is broached, and we want to down it, or get the same consideration for our butter, cheese, eggs, potatoes, apples and the other products of the farm. Why in the name of all that is reasonable, should the farmers of this part of Canada be taxed for the benefit of a small section of the Dominion? Can you conscientiously believe that you should support men who have that end in view?

Is it any wonder that the Grain Growers' Guide and the Canadian Council of Agriculture can send its agents from Winnipeg, at a cost of thousands of dollars, to still the voice of the Maritime Province farmer, with such huge returns at stake. In one year, on flour alone, the three provinces by the sea pay two and a quarter millions of dollars additional, in order to give a special class of farmers, who work but a small portion of the year, fifty cents per bushel more for their wheat.. And if the Canadian Government is again induced to handle wheat, who can say whether fifty cents will be the limit of the increase in flour prices. Is it any wonder that western farmers are anxious to bind eastern farmers hand and foot to the so called "New National Policy" in the preparation of which not a single eastern farmer was ever consulted.

Already, the Maritime Farmer understands, denial of this plot is being made by the paid agents sent here from Winnipeg. The figures submitted herewith prove beyond question what fixed prices of wheat mean in part to the farmers of the eastern provinces. Denial will not down in the face of this incontrovertible evidence. At meeting after meeting, addressed by the paid organizers of the west, this question has been as lightly touched upon as possible. However, it is a live issue and will not down. The men from Winnipeg are discovering that in the disappointingly small results which their labors are accomplishing.

The Maritime Farmer is for the East. The United Farmer movement should be directed in that way. That is the kind of union we want. A union which can meet and defeat the kind of "Equal Privilege" suggested in this article.

The Maritime Farmer is in no wise opposing organization by the farmers of the East—but it believes there should be no Winnipeg string to that organization. We are selling farm organizations supplies far below the selling price of United Farmer stores —(so-called)—and we are tired of the misleading propaganda issued from Winnipeg. In a word we are out to serve the farmers of the Maritime Provinces—not to gold brick them. Thousands of farmers in these provinces trust the Maritime Farmer on its record of a quarter of a century.

Limestone as a Factor in Present Day Agriculture

An Address by W. S. Blair, Experimental Station, Kentville, at the Recent N.S.F.A.

Considerable has been written within recent years about ground raw lime as a soil builder. The best investigators in soil problems have been directing their attention to the part lime plays in crop production, and some go so far as to say that lime is just as much a fertilizer as phosphate, potash or nitrogen. In fact in some of the States to the south of us the difficulty is not in convincing the farmers of the necessity for its use, but in the inability to furnish the lime to meet the requirements of the farmer. In the State of Illinois for instance the Agricultural Associations a few weeks ago guaranteed the limestone Companies of that State the purchase of one-half million tons for 1920. This was done to enable the various limestone quarries to operate during the entire year.

It would be too much to say that all soils will benefit from the use of lime, it is safe to say, however, that over 50% of our soils will be much more productive if lime is used. It is difficult to determine except by field tests just the benefit one may expect from lime applied to his soil. The idea that lime is valuable only as a corrector of soil acid is not correct for lime enters onto the formation of plant food compounds without which plants cannot do their best. The many functions lime may perform in the soil have been grouped as follows:

1st—Supply needed lime to plants.
2nd—Modification of soil tilth.
3rd—Neutralization of acids or other injurious substances.
4th—Effect upon the availability of minerals.
5th—Increase the efficiency of fertilizers and manures.
6th—Meeting the silicate requirements.

That large amounts of lime are required for some crops is evident from analysis. One ton of clover for instance contains 56 pounds of lime. you all know something of the influence of lime in improving the texture of the soil rendering clay soil less cohesive and wet and more pliable when dry. On light soils the action of lime is to cement slightly the soil grains rendering the soil closer in texture or less open and porous.

Acid soils are unsuitable to many plants and the effect of lime is to neutralize this acid, and as well, make the soil more suitable to soil organisms such as those developing on leguminous plants. The nitrate-forming organisms in the soil multiply rapidly under favorable conditions for their growth, and attack soil humus liberating the contained nitrogen combining this with lime to form lime nitrate; or with soda to form sodium nitrate; or with potash to form potassium nitrate, all of which are readily taken up by crops. Soil organisms are at work collecting nitrogen from the air at the same time, thus increasing the total nitrogen over and above the amount contained in the soil humus. Recent investigations would seem to show that lime nitrate is one of the chief compounds from which agricultural crops derive their supply of nitrogen. The liberation of carbonic acid gas resulting from the union of nitric acid and lime carbonate aid in increasing the dissolving power of the soil moisture, thus liberating other essential food elements such as potash and phosphoric acid.

It is evident that lime furnishes a base essential for the development of food combinations suitable for plants and corrects soil acidity which is so objectionable to certain plants, particularly the clover. That this is the case is amply demonstrated in tests made at the Kentville Station during the past five years. It has been found that no system of management will give satisfactory crops of clover without lime. The plants remain dwarfed and sickly while persisting in the soil do not materially add to the crop yields. The Station soil naturally is poor and deficient in humus as is the case on most newly broken lands where evergreens were growing. The fact that blackberries, red top, sorel and similar plants which like an acid soil persisted on these lands led us to believe that the soils were deficient in lime. Tests were conducted in 1914 during the winter with spinach in the green house and it was found that without lime spinach could not be successfully grown on this soil indicating clearly the great need of lime. Accordingly experiments of which I will give a summary were outlined.

It is impossible to use many figures and make the address comprehensive, we have therefore brought together the various crops produced on a basis of valuation allowing 80 cents per bushel for potatoes, 90 cents per bushel for oats, $12.00 per ton for hay, $6.00 per ton for straw and $2.00 per bushel for wheat. These prices I think you will consider fair.

The first test we wish to direct your attention to was that started in 1914 on a poor sandy loam cleared in 1911 and 1912. This was fertilized with 400 pounds of 4-8-10 fertilizer in the spring of 1913, and seeded to Longfellow corn which yielded 4 tons, 100 pounds per acre. This you see was a very poor yield. In the spring of 1914 four series of plots were laid out and comercial fertilizers were applied to each in equal amounts, except on one section of each series no fertilizer was given. Two of these series were limed at the rate of 2 tons per acre and two were left without lime. These plots were not fertilized or limed again until 1917. Potatoes, oats and hay were harvested in 1914, 1915 and 1916. In 1917 it was considered wise to fertilize the whole area with 15 tons of stable mnaure per acre which was evenly applied and plowed under and the land was again limed at the rate of 2 tons per acre and fertilized as before not more than 550 pounds per acre of commercial fertilizer having been used on any of the plots. That is in 6 years there has been used on the best fertilized plots 1100 pounds of commercial fertilizer, 15 tons of stable manure and 4 tons of limestone per acre. Similar plots had manure with and without fertilizer and with and without lime.

Below is given a summary of the crop yields per acre from the rotation covering the first three years 1914, 1915 and 1916 and from a similar rotation for the following three years 1917, 1918 and 1919.

VALUE OF CROP FERTILIZED AND MANURED

1914, 1915 and 1916.

Limed and Fertilized, 3 years	$118.55	
Not Limed but Fertilized 3 years	98.14	
	Gain	$20.41

1917, 1918 and 1919

Manured, limed and fertilized 3 years	$360.62	
Manured, not limed but fertilized, 3 years	312.03	
	Gain	48.59
Gain in 6 years from the use of lime		69.00
Cost of lime and application		16.80
Profit per acre above cost of lime		$52.20

VALUE OF CROP NOT FERTILIZED BUT MANURED IN 1917

1914, 1915 and 1916.

Limed and not Fertilized 3 years	$ 94.15	
Not Limed and not fertilized 3 years	80.16	
Gain from lime first 3 years		13.99

1917, 1918 and 1919

Limed, manured not fertilized 3 years	$339.72	
Not Limed, manured and fertilized, 3 years	260.58	
Gain from lime in last 3 years		$79.14
Gain in 6 years from use of lime		93.13
Cost of lime and application of same		16.80
Profit per acre above cost of lime		$76.33

VALUE OF CROP PER ACRE FOR 6 YEARS

Limed, manured and fertilized	$479.17	
Not Limed, manured and fertilized	410.17	
Gain from lime		$69.00
Limed, manured and not fertilized	$433.87	
Not Limed, manured and not fertilized	340.74	
Gain frim lime		93.13
Limed, manured and fertilized	$479.17	
Limed, manured and not fertilized	433.87	
Gain from fertilizer		45.30
Cost of fertilizer		27.90
Profit per acre above cost of fertilizer		$17.40

It will be noticed from the table that for the first three years the lime added was worth $10.20 per ton from increased yield where the fertilizre was used and during the second three years $24.29 per ton from increased yield where fertilizer and manure were used. It will also be seen that the lime added to the unfertilized area was worth $6.99 per ton from increased yield during the first three years, and on the unfertilized area, manured in 1917, it was worth $39.57 per ton from increased yield during the last three years. For the whole 6 year period the fertilized and manured areas returned an increase from lime equal to $17.25 per ton for each ton used, and the area not fertilized but manured in 1917 returned an increase from lime equal to $19.08 for each ton used.

It will also be noticed that the same area after the application of 15 tons manure per acre in 1917 produced $242.07 more value in crop where fertilized and limed, and that the area fertilized but not limed produced $213.89 more value in crop. It will also be seen that the area limed but not fertilized produced after being manured in 1917 $245.57 more value in crop, and the not limed and not fertilized $180.42 more value in crop due we may assume directly to the aplication of 15 tons manure per acre, making the manure worth $12.03 per ton from increased crop yields. This increase can be largely accounted for because of the soil being practically devoid of humus previous to the application of manure the soil bacteria not having a favorable medium for development and moisture and temperature conditions being more unfavorable for the growing crop.

It is the intention to continue this area without any more stable manure, continuing a three year rotation with clover every third year, and we think the limed area at least will not lack in humus because of the strong growth of roots in the soil. It seems clear, however, that it is advisable to make an application of manure to poor soils similar to this in order to get a proper start, after which stable manures may not be so necessary.

An examination of the limed areas shows a heavy thick growth of clover with deep penetrating roots, whereas the unlimed have an inferior growth of clover and much timothy with much less root development in the clover plants. This difference is striking even to the casual observer, and this difference is due entirely to the use of 4 tons of limestone in 6 years, the other conditions being similar in every respect.

In conection with our orchard tests with fertilizers we have been keeping a record of the yields of the intermediate crops and one of the striking tests in the production of clover was on a plot limed in 1914 with 4 tons of limestone. This was seeded to alfalfa but failed to make satisfactory growth and killed out the next winter. The following crop was potatoes fertilized at the rate of 800 pounds of 4-8 fertilizer per acre. The next season this was seeded to clover with oats. There was a decidedly striking crop of clover on the limed area and timothy only on the unlimed although each had ben otherwise treated alike.

The yield from the limed area was at the rate of 1050 pounds per acre and from the unlimed 1590 pounds per acre, an increase of 540 pounds in favor of the lime. These yields were low in both cases because of low fertility but when one considers the product from the two areas as to actual feeding value that from the limed area is very much greater than on the unlimed because of being clover and the other almost entirely tim-

othy. Clover according to analysis contains 10.7 per cent. of protein and timothy 5.7 per cent. That is, in one ton of clover hay we have 214 pounds of protein and in a ton of timothy hay 114 pounds. On this basis there would be 59.85 pounds of protein in the hay produced from the area not receiving lime and 170.13 on the area receiving lime. The aditional amount of protein because of lime being 120.28 pounds. This would be equal to the protein content of over 400 pounds of oil cake meal. The fair way after all of getting at the value of materials used to increase crop production is through the feed produced, and in feeding other than clover hay one must of necessity use more of the concentrated feeds to make up for the protein he otherwise would be supplying in the clover if the requirements of the stock is to be fully met.

Limed Not Limed

Scene on the Dominion Experimental Station, Kentville, N. S., where Prof. Blair conducted one of the experiments referred to in the accompa nying article.

The use of slag has done very much toward an increased clover yield and while not minimizing the fact that phosphorous supplied in this fertilizer is very important yet it seems that the lime content of the slag has very greatly aided in the clover production. In its finely ground state the lime in it has no doubt been very rapidly made available and furnished the plant with this needed element. That this is the case is amply demonstrated in a series of tests conducted on an 8 acre area. The yield of clover hay on these areas show that one-half ton of slag gave as good yields within 564 pounds as the limestone at the rate of 2 tons per acre. The slag and lime combined gave 619 pounds more than the slag alone and 55 pounds more than lime alone. The slag plots produced 1516 pounds more than the plot receiving neither slag nor lime but otherwise similarly fertilized. The lime plot produced 2080 pounds more than the plot not limed nor slaged, and the lime and slag area produced 2135 pounds more than the are not limed and slaged.

It would seem therefore that slag has played an important part in our present day agriculture and without a doubt has been a good investment for the farmer and while not depreciating the value of this fertilizer which may serve a dual purpose we cannot help but read from these tests that the lime content of slag has played an important part in the results obtained from its use.

A point I wish particularly to emphasize is one probably well kown to you all, but well worth repeating, that clover is at the basis of cheap stock production. In this you are all vitally interested. The first car-load of limestone we used was put on a ten acre field and this was used in an orchard which had not previously been cropped and the land was as uniform as it is possible to get an area of this size. Stripes in this field or ridges between the trees were left without lime and on the unlimed areas the crop of hay was 2800 pounds and on the limed 5520 pounds. Let us calculate this in values as compared with concentrated feeds. Had the field not been limed we would have obtained from the 10 acres 28,000 pounds or 14 tons of hay. We however obtained 55,200 pounds or 27 tons, 1,200 pounds or nearly twice as much. As already stated our land in its natural state will not grow clover without lime and the crop on the unlimed area was largely timothy with some clover. According to analysis mixed hay contains approximately 7.4% of protein, and red clover12.3% of protein. There would therefore have been 2,070 pounds of protein from the 10 acres of mixed hay and from the straight clover where lime was used 6,789 pounds of protein, a difference of 4,717 pounds, or to make the question still more convincing we would have had to buy 7½ tons of oil meal, 32% protein, or 120 bags, 6 tons cotton seed meal, 40% protein to obtain the equivalent in protein if no lime had been used. The hay from the 10 acres limed on the valuation of oil meal at $90.00 per ton would be worth 6$75.00 more for feed than that from the unlimed area. The 20 tons of limestone used cost $80.00 for the 10 acres including hauling and application. The limestone returned a gain equal to $33.75 for each ton used, or $29.75 profit above purchase price and cost of application.

Yet the story is not all told—for with the same fertilization the potato yield on the area limed on which clover grew abundantly was 49 bushels more per acre the following year than on the area not limed.

We have abundant instances of the benefits from lime and it seems unnecessary to follow the matter further with experimental data.

W ecome now to the matter of appli-cation. It seems pretty well established that two tons per acre for the first application is advisable and that one ton per acre every three or four years after will supply the necessary lime and prevent acid soil conditions. It also seems desirable that the application be made when seeding to grain. The usual practice is to apply this during the fall, winter or early spring before working, and to disc the lime in. When preparing for seeding the best means of distribution is a fertilizer distributor of which the Hoosier made by the International Harvester Company is one of the best.

Forme of Lime.—Lime is placed on the market in three forms, namely, the oxide, the hydrate and the carbonate.

These different forms are often given a variety of names. The oxide is known as quick lime, burnt lime, stone lime, caustic lime, lump lime, unslaked lime and building lime. The hydrated lime also is called slaked lime. The carbonate is a form of ground limestone and marl and also occurs in air slaked lime.

The term "agricultural lime" may be applied to any of the above forms and refers to lime sold for agricultural purposes but unfortunately not necessarily to a product esepcially well adapted for application to the soil.

When high grade limestone is burned in a kiln, 10 pounds of the dry stone gives off approximately 44 pounds of carbon dioxide gas, leaving about 56 pounds of lime oxide or quick lime. When 56 pounds of quick lime is moistened it takes up 18 pounds of water and forms 74 pounds of slaked lime or hydrated lime. It is evident then that 56 pounds of quick lime, 74 pounds of hydrated lime and 100 pounds limestone or lime carbonate have the same power to satisfy the needs of the soil. Experiments conducted over a period of years at different Experimental Stations would indicate that the raw ground limestone is the best form for agricultural purposes. Caustic lime tends to destroy the humus through chemical action, resulting in a destruction of organic matter and a loss of nitrogen in the form of ammonia gas which goes off into the air.

There does not appear to be a unity of opinion amongst soil investigators as to the necessity of having limestone ground fine. The finer it is ground the more evenly can it be mixed with the soil and possibly more quickly will soil acidity be destroyed. There are definite experiments which go to show that the fineness of the material is not a mater of much consideration and that any grade passing through a quarter inch screen is as satisfactory as a finer material. For aditional information on this point I would refer you to the work done by the Illinois Experimental Station.

Reasons Why the Farmers Should Pay

The Maritime Farmer is publishing two letters in support of the application of the western grain growers for further government assistance in maintaining artificial prices for wheat. The first will no doubt be received with delight by the dairymen of these provinces, whose product is being marketed at a loss, every week in the year.

The second is a gem. If the grain growers did not ask for a fixed price on wheat, who did? Who is Hon. T. [illegible]ear? Is he or is he not a representative of the grain growers? Well that gentleman not only asked for a fixed price on wheat but he got it from the government from which he was a member, as a war measure. The war is now over. There is no need of any further fixing but the grain growers are preparing to ask the Government to again market their wheat.

And let the Maritime Farmer again say it is opposed to this policy. It is not only opposed to it but it insists that if wheat is to be given special treatment, then Mr. Fairweather's neighbors should receive the same treatment in selilng their produce and Mr. Manzer's neighbors should have their potatoes protected in the same way. A "National Policy" which is only national in its application to the farmers of Manitoba, Saskatchewan and Alberta is altogether too narrow in its scope to suit either the Maritime Farmer or thousands of farmers in this section of Canada.

The letters are as follows:

Hampton, Feb. 9th, 1920.

Editor Maritime Farmer:

Dear Sir,—I have been a constant reader of the "Maritime Farmer" since its introduction and fully appreciate its good qualities and do not feel that any other farm paper so fully meets the needs of the farmers of the Maritime Provinces.

In your issue of February 3rd you published an article under the heading "A Narrow National Policy," and invited criticism thereon. Now when you consider that the average yield of wheat which has fallen from an average "ten year average" of ninteen bushels per acre yield previous to 1917 to about sixteen in 1917, farther down to eleven or twelve in 1918 and about nine or ten in 1919,a decrease of about one hundred per cent., this is for spring wheat (which is our main dependence) to gether with the increased demand from overseas, it does not seem out of the way to guarantee a price that will encourage them to do their utmost to produce to the limit. If they do not will flour or feed be any cheaper? It seems to me the contrary would be the result.

In regard to asking a guarantee of price for our produce, I think we are doing very well with eggs at 80 cents, butter 70c., potatoes $6.00, apples $3.00 to $6.00, and anyway that would only hurt the people of the "Maritimes" as the west buys nothing in the "agricultural line" from us but apples, for which they pay us very well, and moreover, if the west lets up on grain growing somewhat and turn their attention more to stock raising and flood our markets with beef, pork and butter, etc., as they easily could do, where would we be at?

I have been in the west myself and helped (some years ago) to harvest 30,000 bus. of wheat and 15,000 oats, on one farm. Wheat yielded an average of 30 bushels and oats about 80. They do not get such returns now. They do not have the varied resources we enjoy and their climate is very uncertain.

I might add that I am a Liberal in politics and do not approve of a good deal of the legislation of the "so-called" Union Government, but am not disposed to criticise the efforts to help the western farmers over what is undoubtedly a hard situation.

Yours trule,
ARNOLD H. FAIRWEATHER.

Aroostock Jct., N. B.
Feb. 23, 1920

The Maritime Farmer,
Sussex, N. B.

Dear Sirs:—

The Wheat Board sell the western wheat on the open market, where the prices varies according to supply and demand, just the same as individual grain dealers would do. And they cannot get a higher price than buyers offer.

Such being the case, how is anyone taxed for the benefit of the Western farmer? All the Wheat Board can do is to stabilize the Canadian market, thus avoiding the ups and downs from which the dealer is much more likely to profit than the farmer.

Yours truly,
J. J. MENZER.

Report of The Nova Scotia Supt. of Dairying

Prepared by G. A. MacKay at the N. S. Dairymen's Assn.

I have the honor to submit herewith my eighth Annual Report in connection with the Dairy business in Nova Scotia. As in former years the efforts of this Division were largely directed along the lines of Co-operative Dairy work and as the natural tendency in Nova Scotia for the last number of years was creamery work, consequently the work was largely directed towards this phase of the work.

At this time the following statistics might be of interest:

OUTPUT OF NOVA SCOTIA CREAMERIES, FIFTEEN YEARS 1905 TO 1919

Year	No. of creameries in operation	Pounds of butter made	Value of butter made
1905	10	290,714	$ 63,957.30
1906	11	287,846	66,204.58
1907	7	164,184	40,896.00
1908	7	163,147	40,886.00
1909	6	183,248	45,812.00
1910	10	256,420	76,669.20
1911	10	320,763	83,398.38
1912	11	470,603	130,076.17
1913	14	709,012	194,802.46
1914	17	913,273	257,600.00
1915	20	1,224,483	366,011.24
1916	21	1,612,627	475,814.61
1917	22	1,760,871	645,253.30
1918	21	1,762,264	872,328.27
1919	22	2,093,804	1,172,410.90

While these figures do not show any great development and to a certain extent is only a changing of methods of manufacturing, still some progress has been made and this more particularly in certain sections where some real develophent has taken place as the following table will show:

STATEMENT SCOTSBURN CREAMERY, PICTOU CO., N. S.

Year	No. patrons	Lbs. Butter	Net value fat per lb. to patrons	Value of Butter made
1905	26	11,142	21.42	$ 2,153.20
[illegible]	32	13,307	21.73	2,066.71
[illegible]	35	10,054	22.31	1,943.03
[illegible]	38	16,122	24,22	2,400.51
1909	81	34,325	24.19	6,801.18
1910	204	107,715	24.40	22,146.04
1911	380	170,847	25.85	36,181.99
1912	423	181,614	30.14	44,788.08
1913	450	229,574	27.97	55,305.06
1914	502	277,672	28.07	65,678.48
1915	538	293,552	30.00	76,520.54
1916	592	327,715	34.25	97,077.06
1917	558	380,259	44.00	134,884.47
1918	632	388,621	52.00	164,488.17
1919	700	446,171	63.00	243,235.18

In this section there are some very striking evidences of what can be done in Dairying by following advanced methods. For instance the "leading" patron in n1919 sent to this creamery about $300 worth of cream from an average of about 15 cows, and on a farm that ten years ago did not produce over $300 worth of milk.

In my last report I itemized what I considered were some of the reasons why dairying was not making more progress. While at the present time not a great deal has been done to overcome these obstacles, still there are aparent movements in the right direction and more interest is manifest in the dairy cow. Chief of these is a greater demand for pure bred dairy sires of the right type and ones with some Record of Performance behind them, a renewed interest in Cow Testing Work. In Colchester County a Milk Producers' Association has recently been orangized and many evidences are at hand from different parts of the Province pointing to more intelligent efforts to better and more economical methods in Milk Production.

Creameries

One new creamery was started during the year by Biden's Ltd., in Amherst, this being the outcome of the agitation two years ago to start a co-operative creamery. This creamery was registered as No. 25 and as the statistics will show has made a successful start, especially considering that the creamery is a subsidiary to the Ice Cream business.

The Model Creamery at Musquodoboit owned by Mr. H. A. Beck, also made substantial progress and is now among our most flourishing cseamerdate application has not been made to reopen it.

ies. It was registered during the year as No. 26.

Fairview Creamery at Berwick was closed July 31st for repairs and to

Other creameries were operated on about the same basis as last year.

The Inspection and Instruction work was again caried on by Mr. R. B. MacLennan and as his atached report will show, he had a busy year.

Exhibitions

number of the creameries again competed successfully at the larger Canadian Exhibitions, especially at the Canadian National at Toronto. Brookfield Creamery captured first prize and Pictou Co. Dairy Company Antigonish Dairy Compan, Scotsburn Creamery and LaHave Creamery Co. Bridgewater, were also among the usccessful competitors.

Four of the creameries participated in the 'Dominion Educational Butter Scoring Contest," the features of which are already well known to the general public, and probably the outstanding lesson proven as far as Nova Scotia conditions are concerned was that the butter that was made from well pasteurized cream had good keeping qualities and was safe to store for winter use, while the butter made from unpasteurized or poorly pasteurized cream only kept for two or thre months and was unsafe for storing for winter use.

At the invitation of the Dominion Dairy Commissioner I had the privelege of scoring all the butter in this competition in Montreal towards the end of October, and can therefore verify the statement made above. It was gratifying however to find that the samples from Nova Scotia stood up well with the samples form any other Province and on the total score for "workmanship" Scotsburn Creamery scored the highest in the Dominion.

I had the privilege of acting as judge of the Dairy Exhibits at the N. B. Provincial Exhibition at Fredericton and the Prince Edward Island Provincial Exhibition at Charlottetown during the month of September. Also at a number of the Provincial Exhibition and of the Dairy Exhibit in connection with the N. B. Dariymen United at Sussex during the month of December.

The Dairy Division conducted a Demonstration Creamery at the Maritime Winter Fair in Amherst in December. This served a two-fold purpose of making a means of manufacturing the milk for the Exhibitors in the Milking Competition and of demonstrating to the public the value of a creamery and to a certain extent the value of milk products as wholesome food.

The booth was visited by many of the visitors and exhibitors at the Fair.

Booths were also conducted by some of the creameries at the County Fall Exhibitions. These conducted on educational lines are to be commended and no doubt would help to popularize Dairy methods.

Grants

Grants were recommended to two creameries during the year under the Act for the Encouragement of Dairying.

Dairymen's Association

The Annual Convention was held on the 9th and 10th of January. In 1918 a separate report was published and it was the intentio to publish the 1919 report in separate form. For various reasons this was not done, but it is expected that the 1919 and 1920 Reports will be published together after the next Convention which will be held at the College of Agriculture on January 2nd and 23rd.

Meetings and Organization

I ersonally attended forty-one meetings during the year in different parts of the Province, and in connection with the different parts of the work. The principal of these were Annual Metings during February and March; April, May and June in connection with many of the creameries, in explaining to the patrons many of the difficulties that arise in the work.

During July and August some meetings were held in Hants County. First in the district covered by "The Gores," The Hawdon and surrounding districts, in an effort to establish a local coo-erative creamery, and later on the Bay Shore between Burlington and Walton in an effort to establish a creamery there. In both these sections there is undoubtedly the ossibilities for successful local creameries but up to the present time neither company has completed organization.

I attended a number of Farmers' Picnics and a meeting of the Pictou County United Farmers in August. This meeting was relative to the future of this Comany. I urged on them the importance of standing together in this Co-operative enterprise and that the success or failure of this Company wuold have a distinct bearing on the future agriculture of Pictou County.

Other meetings were held at different times in different places in the interest of many parts of the work. During the months January to April inclusive, my time was largely taken up as usual in connection with the instruction work at the Agricultural College and Dairy School.

Dairy School

The Third Annual Session of the Maritime Dairy School was held at the College of Agriculture on practically the same basis as previous years. The courses running as follows:

March 12th to 25th — Creamery men's Course. Enroleld attendance, 22. Instructor, R. B. McLennan.

March 26th to Aril 3rd.—Cheesemaker's Course. Enrolled attendance 9. Instructor, H. W. Coleman.

March 26th to April 3rd—Milk Testers' Course. Enrolled attendance, 10. Instructor, H. R. Brown.

The total attendance was 41.

Ben Gallant was instructor in Milk Testing in the Cheese and Butter Course. Instruction was also given by Professors Harlow, Trueman and Smith, of the College staff, in their respective subjects.

A similar course is being arranged this year to date from March 10th to April 3rd.

In my last two reports I stated that the need of larger and more commodious quarters for the instruction of Dairying in the Maritime Provinces. The need has become more imperative during the year and to date nothing definite has been done, although some action has been taken. At the Annual Conventions of the P. E. I. Dairymen's Association, the Nova Scotia Dairymen's Association and Dairymen United of New Brunswick (this later was endorsed by the Farmers' Association of New Brunswick) unanimous resolutions were passed and committees appointed to bring before the proper officials the need of a larger Dairy School. This committee held two meetings during the year and while nothing definite has yet been done, progress can be reported, and in the interests of Maritime Dairying it is hoped that some definite work will be undertaken before another year.

Government Creameries

This Division stil operates the Baddeck and Margaree Creameries and this year shows some definite progress in both places. The business at Baddeck increased from 37,309 lbs., worth $17,738.16 in 1918, to 59,443 lbs. worth $32,973.74 in 1919, and at Margaree from 31,334 lbs. worth $14,225.56 in 1918 to 52,977 lbs. worth $28,604.55 in 1919. Both creameries operated during the winter of 19181-919 but at quite a deficit. Margaree is closed for thre months this winter but Baddeck is kept operating all winter. The managers reports are attached to this report.

The accounting of both these was again done in my office by Miss Sanders, the steongrapher and Accountant of this Division. A separate financial report is published annually of both these creameries, a copy of which may be had by applying at this office.

Cereal Mills

The Cereal Mill owned at Baddeck by the Department is still being operated under my direction and daily reports coming to my office and the annual audit made the 1st of August.

The Inverness Mill has been rented for a term of two years to A. J. Campbell, of Inverness. Both these mills are giving general good satisfaction to the public, but from a financial standpoint are not proving successful as business concerns. To make them profitable, some other branch of business such as flour, feed, etc., would have to be carried on in conjunction with the milling.

National Dairy Council

This is a union that got under way during the year of all the influential dairy bodies in the Dominion of Canada with headquarters at Ottawa and already has done some valuable work for Dairying and has bright prospects for the future if the Dairymen stand behind it. The Council receives no Government support but depends on the dairy business entirely for its sup-

port. The Representatives on the Council from Nova Scotia are D. W. Murray, Scotsburn and Harold Falconer, Stellarton.

The statistical reports of the Cheese Ftcories and Creameries will be found at the end of this report. Unfortunately Cheese Factories have nearly disappeared in this Province, only one being left, but it is doing a ogod gusiness, making this year 47,-360 lbs. of cheese of a value of $13,-055.73. Creameries show an increase over 1918 of 452 patrons. An increase of 331,439¾ lbs. of butter. And increased value of the business of the year reaching $360,552.90.

General

Babcock Testers were loaned during the year to eight new Cow Testing Associations that were organized during the year by H. R. Brown, of the Dominion Dairy Division. These testers to be returned at any time the Association should go out of existence.

Testers were also supplied to any of the Rural Travelling Teachers that applied for them for demonstration purposes in the public schools.

The Chemical eDpartment of the Agricultural College again supplied the creameries through our Division with the necessary chemicals for use in the "Acidimeter" and Salt tests. This has been done without any charge to the creameries and has been very valuable to them and the appreciation of this Division is due Prof. Harlow and his assistants for the time they have spent and the interest they have taken in this work.

During the last number of years a great amount of my time has been taken up with what might be classed as detail work in connection with the Cape Breton Creameries and Cereal Mills. Consequently very little new organization, investigation or propaganda work could be undertaken, and now with the changing of conditions there is more apparent need for more work of this kind and I trust through the coming year to make some suggestions and necessary changes that new work in these lines may be undertaken.

Mr. R. B. McLennan, who has been Inspector and Instructor for two years, severs his connection with the Division about April 1st to devote his full time to his creamery business, that he is moving from Brookfield to Truro. Mr. McLennan did valuable work for the creameries in Nova Scotia during the two years he was working among them. His successor has not yet been appointed.

It is gratifying to note that the Cow Testing Associations conducted by the Dairy Division at Ottawa and under the direct supervision of Mr. H. R. Brown, have made splendid progress during the year and on all hands results are obtainable to prove the statement referred to in my report yearly, that this is the only safe, sure and satisfying way to successful and economical milk production.

Again I wish to express my appreciation to all who in one way and another have done something to advance and popularize the Dairy business in Nova Scotia during 1919 and I trust their efforts will be richly rewarded.

W. A. MacKay, Esq.
Dairy Supt., Truro, N. S.
Sir:—

I beg to submit my second annual report in connection with the Margaree Creamery, being the fourth annual report of the Creamery.

This year's report covers the season fom January 1st to December 16th, the creamery having been operated all last winter.

I am pleased to report a very substantial increase in the output of butter over last year, about 22,000 lbs.

This increase is quite gratifying, and although the season, generally, was very favorable for the production of dairy products, it shows that the people here are taking a more active part in dairying. I feel confiident that the Margaree Creamery has a bright future, but would urge patrons not to feel that they have obtained their objective, but to put forth their best efforts to produce more and still more and thus build up for themselves an industry of which they can be justly proud.

The operating of the creamery last winter was largely to demonstrate to the people what the possibilities of winter dairying were and I am confident that it has induced them to make better efforts along these lines.

The quantity of cream received during the winter season, however, was too small to make it a paying business from the Creamery's standpoint and it was considered hardly fair to the business to run it again this winter at a loss, so it was decided to close the business for about three months. This was also sanctioned by a meeting of the Board of Trustees held on Nov. 28th.

Last spring I was induced to make some inquiries in the Cheticamp district, with a view of extending our cream route there. After some enquiries I arranged for a series of five metings in that district. At these meetings I was very ably assisted by Rev. P. LeBlanc, Rev. A. H. Cormier, C. T. AuCoin and J. F. LeBlanc.

We had an average attendance of about 50 at these metings and we received sufficient encouragement to warant the extension of our cream route to accommodate that district.

To my mind the results obtained were quite satisfactory for the first year, and I feel confiident that next year will show greater results.

The meetings held by yourself in that district in November were very instructive and pleasing to the people and I am sure will be a great help towards getting the people more interested.

The outlook of the creamery for the next year is, I think, very favorable. I look forward to a much bigger out-put than this year, and if unfavorable conditions do not hamper production I feel that I am not mistaken. I would again urge the patrons to look with a kindly eye to the old cow and get her in condition to earn cow and get her in condition to earn more dollars for them than she did last year.

Feed her well during the winter months and she will be in a position to do a bigger business on the old stand next spring.

It might not be out of place here to remind the patrons that next spring is the time to plan for a plot of roots and green feed for fall and winter feeding. This is the only way by which they can supplement the failing pastures.

In bringing this report to a close I wish to thank yourself and other members of the Department for very valuable advice and assistance given me.

I wish to thank all those who in any way helped along our business.

All of which is respectfully submitted.

(Sgd.) H. H. MacDonald,
Margaree Forks, Dec, 21st, 1919.

Baddeck, N. S. Dec. 23, 1919
W. A. MacKay, Esq.
Dairy Supt., Truro, N. S.
Sir:—

I herewith submit the sixth annual Manager's Report of the Baddeck Creamery.

For the second year the Creamery will operate all winter, though the interest taken by the patrons in winter dairying has so far been disappointing.

The past year has been the most successful in the history of the creamery, 59,443 pounds of butter being made, against 37,309 pounds in 1918. This was due to an increase in the number of patrons, an effort on the part of the aptrons for greater production and the excellent pastures and after-grass of the past season.

The outlook for the coming year is exceptionally good. Some twenty farmers, who have not previously sent cream, have already promised to send next year and we expect greater production from our present patrons.

(Continued on page 434)

MARCH 16, 1920

FARMERS WANT UNION—BUT

Nobody questions the need of organization among farmers. The Maritime Farmers has done much to encourage the farmers to get together and work for their own interests. But the Maritime Farmer not only questions the wisdom of Maritime Province farmers uniting with the Grain Growers, but believes tbat the whole movement will work out to the disadvantage of the farmers of eastern Canada. There is nothing in common between the two groups. The eastern farmer has never been asked what he thought of the New National Policy and its many offshoots, all of which are in favor of the westerners. He is simply being asked to swallow the dose, and swallow it all. So far as this paper is concerned it for the east all of the time, and it is not worrying about the pretended woes of the man who mines wheat. The Maritime Farmer will stand behind the United Farmers of Nova Scotia, New Brunswick and Prince Edward Island to the limit; but to again quote Secretary J. B. Musselman, of the Saskatchewan branch of the United Farmers, "the association is a catspaw for a clique, who are out to further their own political ends." Incidentally they are out to soak eastern farmers for their flour and feed supplies. That is the sort of Union that this paper opposes. The farmers of British Columbia have refused to follow Winipeg blindly. That is what we want to do in the Maritime Provinces. Let us run our own show. We have the brains and we have the men capable of doing it.

WEST AGAIN AGAINST EAST

At the recent meeting of the Nova Scotia Farmers Association, a resolution was passed demanding in behalf of that province a share in western school lands, the idea being to use the fund for improving rural education in the province. The suggestion is a good one. It is fair, too. But it comes at a time when the several premiers of the western provinces are asking the Dominion government not to pay a cent to the eastern provinces. The west is asking for its natural resources, presently controlled by the Dominion government and they also wish to retain the special subsidies which Canada has been paying in lieu of control of these western resources.

So you see it is to be a fight between the east and west. There is no question but that the east has a just claim to remuneration for anything handed over to the west. The Maritime Farmer supports that. But have you thought what the attitude of the west will be? Today the Canadian Council of Agriculture has agents working throughout the Maritime Provinces trying to tie up Maritime farmers to that organization, with only one object in view—getting everything that the WEST THINKS IT WANTS. AND ITS WANTS ARE MANY. In order to better impose these and other views on eastern Canada the Grain Growers Guide, of Winnipeg, endeavored to buy the Maritime Farmer. Not being able to do that it has established its own organ, which is owned and controlled in Winnipeg. How much support do the farmers of Nova Scotia imagine they will get for their claims for a share in the western school lands from the Grain Growers Guide of Winnipeg? The Maritime Farmer will cheerfully support all organized farm movements intended to benefit the eastern farmer, but we again express the opinion that eastern farmers should control their own organizations. There never was a better illustration of the importance of maintaining our eastern viewpoint than the passing of this resolution by the Nova Scotia farmers. The ink is hardly dry on the paper before western farmers are pressing against the contention of the Nova Scotians. It's just another case that justifies the action of the Maritime Farmer in refusing to sell out to Winnipeg. There is little in common between the farmers of the west and the east.

CAN'T FOOL FARMERS OF DEBEC

The farmers of Debec refuse to be fooled by the propaganda of the western United Farmers (heretofore the Grain Growers). At a recent meeting of the leading farmers of that section the whole movement, on which interested persons in Winnipeg are spending thousands of dollars in an effort to rope in Maritime Province Farmers, was roundly condemned . Those "spellbinders" who are travelling about the country districts in this province promising to make the sun shine at night, were referred to by the farmers of Debec as "Demagogues and political adventurers." It looks as if the paid emissaries from Winnipeg are not making as much headway as they anticipated. The farmers of Debec, like the Maritime Farmer, think that we can run our own affairs without too much advice from the grain belt. Men who taxed this part of Canada, a short time ago, by an additional levy of $2,250,000 per annum on flour by a gentle raise of 50 cents per bushel on the prices of wheat, are just what Debec farmers believe them to be, "political adventurers." The Maritime Farmer does not presume to tell any farmer how he should vote. But the Maritime Farmer does not hesitate to join with hard headed men of Debec in expressing its opinion that the United Farmer movement as at present directed in these provinces, from Winnipeg, is intended to benefit the Grain Growers and work everlasting injury to the farmers of the Maritime Provinces. Figures in another part of this paper amply demonstrate that.

MEETING SPRING HALF WAY—DOING ODD JOBS ON THE FARM

Odds and ends of repair work on implements is one of the big items in a spring preparation campaign. Every season and every season's work, brings its share of wear and tear on farm machinery and now and then some little part goes out of 'kilter." A broken bolt, a break that has been replaced by a first aid fence wire bandage, a split tongue in the mower or reaper that carries two wooden splints securely nailed on and made still more secure by a few tightly wound strands of wire—relics of a near-accident in the harvest field last summer; a couple of teeth missing from the horse rake; one of the wheels of the spring tooth cultivator badly warped and twisted, etc. These are samples of a few of the defects a season's usage is liable to inflict on the tillage and harvesting equipment. A stitch in time invariably saves nine, and this instance is no exception to the general rule. According to all principles of good business, prompt repairs means a saving of dollars and cents for a neglected small repair can be counted on to result in a bigger and more costly break later on. Furthermore if the serious breakdown should occur in the midst of a busy season, when every minute of daylight is precious, the total cost of the accident may reach rather formidable proportions. As an effective means of side-stepping the possibility of serious delays later on there is nothing like a late winter or early spring implement overhauling bee.

But preparations for spring do not by any means begin and end with the housecleaning stunt in the implement shed, for there are other items of almost parallel importance. How about the big manure pile which adorns the barnyard? Sooner or later it has to be moved out to the land to supply plant food for next year's crop. Why delay the chore or moving it out to where it belongs? The manure spreader, of course cannot be conveniently operated in knee-deep snow, but on a good many farms the old reliable "Armstrong" make of spreader is still in use, and this "machine" seems to work better, if anything, when the snow si on the ground, for the reason that the sleigh is in many ways handier for hauling purposes than the wagon. Some have contended that spreading manure in the spring is a wasteful process in that under such a plan a portion of the fertilizing constituents are washed away in the spring thaws. No doubt there is some truth in this argument in so far as it concerns manure spread on steep slopes or in gullies where temporary spring freshets are likely to flow. But by sidestepping these areas—they will not amount to any great acreage on the average farm—and postponing their treatment until later in the spring, the farmer who gets the manure yard cleaned up in the late winnter certainly will not lose much in terms of plant food, and should the spring work come on with a headlong rush, as it frequently does, he may be leagues ahead in the point of valuable time saved through having this heavy chore off his hands.

We could, without difficulty, go on and mention several other matters which could very well be included in spring preparations, but after bringing the matter to notice by the suggestion of two or three of the more important ones we leave it to the farmer himself to complete his own programme.

HOME GROWN CROPS

An Address by Prof. J. M. Trueman, N.S.A.C., at the Recent N. S. Farmers Association

Before discussing some of the crops that may be grown on Nova Scotia farms, I would like to call your attention to the need for increased supplies of roughage. To illustrate what I have in mind, we will discuss for a few minutes the cows that are kept in the Province and the way they are fed. The report on the crops of Nova Scotia for 1919, published jointly by the Secretary for Agriculture and the Secretary of Industries and Immigration, gives our cow population as 159,985, or practically 160,000. The amount of milk given by these cows is not so easy to determine. It will probably not average more than 4000 lbs. per cow. The cows that supply the creameries of Nova Scotia, some 25,000 in number, have not given 4000 lbs. on the average, but probably the cows supplying the cities with fresh milk have done better. In one creamery where the average production per cow was less than 3000 lbs., one herd produced an average of 8000 lbs.

It will be seen from the figures that the production of Nova Scotia cows is not large. We do not need to leave our own Province to find illustrations showing that production might be greatly increased. This increase may be brought about by better feeding of the cows now available and without waiting for the slower method of improvement by breeding. I do not mean by that to discount in any way the importance of improved stock, or the importance of weeding out the poor producers. What I want to impress upon is the fact that much better returns could be obtained even from the cows now at hand, by improved methods of feeding. To illustrate this point, I would call your attention to the case of one man supplying cream to the Scotsburn creamery. This man believes thoroughly in the idea of liberal feeding. He buys cows of the type he wants wherever he can find them. He undoubtedly knows how to select fairly good cows, although he cannot buy the best in the country, as the Scotsburn farmers have become too sharp to sell them. The interesting point about this man's cows is that they generally give double the amount of milk to him that they were giving to the man from whom he bought them. With 15 of these very ordinary cows last year, he took $3100.00 in money for cream from the Scotsburn creamery. Beside this he had the skim milk for calves and pigs, and the large amount of fertilizer from these well fed cows to enable him to raise bigger crops and feed still more cows the next year.

It is interesting to note in an article written by Principal Cumming in 1912, that he estimates the yield of Nova Scotia cows at somewhere near 3000 lbs. of milk per year. The figures given a few minutes ago increased that average to 4000 lbs. Principal Cumming states that it would not be out of the way to expect each cow to give double 3000 lbs. per year, or 6000 lbs., and that even then the cow would not be considered a very profitable animal. We have today 160,000 cows in Nova Scotia, producing 640,000,000 lbs. of milk. This amount could easily be produced by two-thirds the present number, or by say 110,000 cows. In that case, we are feeding 50,000 cows more than are needed to produce our present milk supply. The food required to maintain that many cows is not less than one and one-half tons of good hay for the 7 winter or barn feeding months. This would only keep them alive, neither gaining or losing weight. That amount would be required to keep the cow machine going without returning anything to the owner. One and one half tons for 50000 cows means 75000 tons, worth today at $20.00 per ton, $1,500,000.00. I think we can put that amount down as a clear saving as the feed given these cows over and above a maintenance allowance, and all the pasture they would eat if given to the remaining 110,000 would give enough to make up the extra supply of milk we expect them to give.

What then is the remedy? Shall we kill off 50,000 cows and feed the remaining 110,000 a full ration? Evidently there is another way of dealing with the problem, and that is to raise more feed and have an abundance for the total 160,000. Is it possible to raise a sufficient amount on our Nova Scotia farms? Ask the people of Denmark to answer that question, or even ask the best farmers of Nova Scotia.

In an article written in 1913 by J. B. Spencer, Secretary and Editor at that time, of the Canadian Swine Commission, he gave some figures comparing the live stock population of Nova Scotia with that of Denmark. Denmark has 32 cows per hundred acres, while Nova Scotia only had 8. Denmark had 50 swine per 100 acres, while Nova Scotia had 4. If Denmark can feed 32 cows per 100 acres, surely we should have no difficulty in feeding 8, or in increasing our numbers to twice eight. These figures may not be exactly correct at the present time, but they are nearly enough correct for purposes of comparison.

You may perhaps wish to call my attention to the fact that Denmark imports great quantities of grain or mill feeds. That is true, but she can only afford to do so because she raises large quantities of roughage. We sometimes hear it said that Nova Scotia farmers cannot make money with cows because they buy so much expensive mill feed. Their failure is not due to buying millfeed, but to the fact that they are short of roughage, or home grown feeds and are trying to make up for this lack by using extra amounts of expensive grain. At this point we are reminded forcibly of the fact that the farmer's wealth, if he ever has any, comes ultimately from the soil. Whether he is successful or not in the general run of cases will depend on whether he gets much or little out of the fields which he tills. Large, abundant, enormous crops of hay, oats, turnips, silage and pasture mean prosperity. Given these the farmer can then afford to add to them reasonable quantities of concentrated feeds. Larger numbers of live stock can be fed liberally with roughage and the addition of moderate quantities of cotton seed meal, oil meal, gluten, middlings and bran will increase the richness of the droppings and subsequeı tly the fertility of the soil.

I dwell upon this phase of the subject because I am convinced that the time has come when we can help ourselves to the greatest extent by so fertilizing and cultivating the soil as to secure much greater yields than have been common in the past. If you suggest that I have been dealing in generalities, remember that what is true of the Province of Nova Scotia as a whole, is true for every farm that is feeding cattle. Furthermore, when you consider that what I have said about cows is true in a measure for all cattle, of which there are 247,000 in addition to the cows, you can see that the losses from poor feeding are enormous. The only thing that has kept the farmer from bankruptcy under this system has been the cheap gains made.

After this lengthy introduction, I am ready to spend a few minutes discussing the feeds we may raise. Our most valuable farm crop is hay—685,915 acres gives us almost 1,300,000 tons of hay this year, worth at $20.00 per ton, $26,000,000. I need not spend any time urging you to pay more attention to the hay crop.

The oat plant does well in this Province, and deserves to be grown in larger acreage and on richer land. An increase of 10 bushels per acre would mean 1,500,000 bushels on the 150,000 acres now grown. Both the oat grain and the oat straw are valuable products which fit into our method of farming to perfection. Oats for the horses, cattle and sheep especially, and straw for bedding for all classes of live stock makes this plant worth growing in the most approved method. It is a common belief that oats are exceptionally hard on the land but this is not true, a 2 ton crop of hay taking more out of the land than a 40 bushel crop of oats.

Large crops of turnips will pay well for the work of raising them. The Scotchman and Englishman who raises the finest cattle in the world, feed heavily with roots, often as much as 150 lbs. per animal per day. The Nova Scotia climate and soil are both well suited to this crop and it should be grown more extensively than at present.

One of the interesting feed questions at the present time concerns the value of silage. In countries adapted to corn growing, silage has proved of great value in cheapening the cost of production. Parts of Nova Scotia are suited to growing corn and where this is the case, it is a good plan to use it liberally. In the Northern and Eastern parts of the Province however, corn does not do well and oats, peas and vetches may be used instead. At Truro for four years, corn averaged 9.75 tons per acre and O.P.V. 9.62. The O.P.V. contained considerable more protein than the corn and also much more dry matter. The cost of raising the O.P.V. was much less than the corn, as there was no cultivating or hoeing to be done. In order to get a heavy yield of this crop, which is the only kind of yield that pays, well fertilized soil is necessary.

ere n mo,m alǫU vlt aots eh shrdluu

Another item of great interest is good pasture. We in Nova Scotia have not paid much attention to the improvement of our pasture. At the Agricultural College, we have for the past six years been fertilizing a permanent pasture and keeping account of the number of cattle it carried and the gains made. The fertilizers used have been wood ashes and basic slag. The last four years the slag only has been used and at the rate of 400 to 500 lbs. per acre. Some 10 to 12 acres have been covered each year so that it takes about five years to get over the whole pasture of 50 acres.

The results have been most satisfactory. The following table shows the number of animals pastured, the cost, and the gain made. The animals were mostly yearlings and two year olds in good condition for growth:

	Interest	Fert-ilizer	Pasture New Seeding	Fence	Total	Number Animals	Gain	Cost per lb.
1917	$102.00	$51.00			$153.00	37	3130	5c
1918	102.00		$152.13		259.13	37	4795	5.4
1919	102.00	17.00		48.00	167.00	34	5200	3.

The low cost of 3c per lb. for gain shows the great economy of getting as much gain as possible from pasture. Cost of gain in the barn will run to 20c a lb. at the present time.

Every man who sells a pure bred animal either to improve a grade herd or to start a beginner in breeding, should deliver a lecture to the buyer on the necessity for good feeding. It is perhaps so much our custom to encourage people to think that the good blood we are selling them is all they need, and that becouse an animal is pure bred it will necessarily be a great producer even in the hands of a poor to average feeder. Continually and everlastingly the fact should be kept before the buyer that of good pure feeding. I believe the best advertising for any association would be to claim that their breed could eat more feed than any other. If we could get farmers to racing with each other to see how much they could get their cows to eat, we would come pretty near solving the problem of the improvement of the cattle of this country. Some one may suggest that it would be easy to waste feed in this way. Such waste would not last long. The cow that failed to make a show down at the pail would soon go to the butcher.

I have suggested a smaller number of cows. How will that agree with our desire to increase the use of pure breds? To my way of thinking it is the only way of accomplishing our purpose. Whenever it becomes known that pure breds or highly bred grades are the cows that will respond to generous feeding, and generous feeding has become the custom, the demand will far outrun the supply.

Two things that have kept the scrub bull in existence are the numbers of pure breds that have been sold and the failure to feed properly either the pure breds in the small herds of beginners or well bred grades. This is a day when business efficiency is expected of every man. The farmer has sometimes been accused of getting high prices and of being a profiteer. I have kept farm accounts for many years and in many cases the farmer has not even yet in these days of high prices received an adequate reward for his labor and investment. Nevertheless we have no right to charge people any more than is necessary on account of inefficient methods, and along with our demands for just prices for our goods should go an honest effort to reduce the cost of production.

Increased numbers of well bred, well fed dairy cattle is one of the best ways to improve economic conditions of both producer and consumer.

EGG EATING HABIT

A subscriber informs us that one of his neighbors told him that the egg-eating habit had developed to such an extent among his hens that he had almsot despaired of being able to cure them. As a last resort he tried a method that gave wonderfully satisfactory results.

He took an egg and partly removed the contents by making a small hole in both ends of the shell and blowing out the white, sealed one hole with a little paste, and broke the yolk still remaining in the shell. He then filled this with ammonia, shaking the egg thoroughly to get the two well mixed. After sealing the remaining hole he took the "egg' to the henhouse, and laying it down on the litter, cracked the shell in sight of the hens and openly invited them to share in the feast.

They eagerly accepted the invitation, and after one mouthful they were equally eager to relinquish their place around the egg to some other hen.

Evidently the taste lingered, for when these hens were invited the next day to a banquet in exactly the same manner, but with an egg that was still warm from the nest and perfectly good, they refused the invitation and never again have any of them showed signs of wanting to eat another egg.

Gleanings of Agricultural Progress in New Brunswick

CO-OPERATIVE SALE OF WOOL

Co-operative sale of wool when compared with other co-operative enterprises is practically a new undertaking. However, it has met with marked success whenever given a trial and has saved the wool growers thousands of dollars.

Benefits Derived

1.—The wool is sold direct to the manufacturer thus the wool receives the market price, eliminating the dealers' profits.

2.—Wool growers are not at the mercy of the local buyers; outside competition forces them to pay a higher price.

3.—Co-operative marketing means the elimination of several middlemen.

4.—Organized selling considerably reduces the overhead expenses which have to be borne by the producer.

5.—Because the price depends on the quality marketing wool co-opertively results in better wool being produced and consequently better cared for sheep.

6.—The rate of so much per pound irrespective of quality is disliked. The wool grower with clean dry wool receives a premium for his trouble.

7.—Co-operative marketing of wool leads to co-operation in other lines.

History In New Brunswick

The first real attempt to market the New Brunswick wool clip in a co-operative manner was made by the New Brunswick Department of Agriculture in the spring of 1918. Wool was shipped to two grading stations which were established, one at Moncton and one at Fredericton. During 1919 this work was conducted with only one grading station, i. e., Fredericton and this plan proved very satisfactory. The fact that the amount of wool graded each year shows a substantial increase and that the number of satisfied patrons continues to grow speaks well for the success of this work. The growth of the co-operative wool marketing in the Province is indicated by the following table showing amounts of the various grades handled in each of the two years in which this plan has been followed.

Grade	Amt. handle in 1918	Amt. handle in 1919	Net price to Farmer 1918	Net price to Farmer 1919
Clothing ..	50		.81¾	
Fine Medium Combing ..	1778		.82½	
Med. Combing	18602	28550	.81¾	.67
Med. Clothing	39		.79	
Low Medium combing..	9502	28127	.75½	.62
Low combing		1092		.49
Coarse	691	334	.69½	.42
Cotts		230		.26
Rejects ...	4035	27	.42	.29
Grey and Black ...	3675	842	.50	.39
Locks and Pieces ..	150		.40	
Tags	152	638	.10	.08
Total ...	31735	55840	.771c	.627c

Average price in 1918, .771c.
Average price in 1919, .627c.
No. of shippers in 1918, 317.
No. of shippers in 1919, 547.

Plan for Marketing this Year's Wool Crop

Realizing that the co-operative marketing of wool has been one of the greatest factors tending to improve the sheep industry of the province, the Department of Agriculture is again assiting the wool growers in the marketing of the 1920 wool crop. The work will be conducted as in 1919 with one central grading station at Fredericton. The greater the amount of wool handled the less will be the expense per pound. If you have never marketed your wool in this manner previously, now is the time. Follow the methods of New Brunswick's most successful sheep men, market your wool clip in the most up to date manner. The wool is sold direct to the woolen manufacturers of Canada and the United States. The business in connection with the grading and selling is done by the Canadian Coo-perative Wool Growers, Ltd., of which A. E. Trites, of Salisbury, is the director for New Brunswick. About 90% of the market value of the wool will be paid when the wool is received, the balance after wool is sold.

For further information write to the Live Stock Division, Department of Agriculture, Fredericton, or to the Agricultural representatives of the Department, Mr. J. H. King, Moncton, Jas. Bremner, Chatham and J. H. Hoyt, Woodstock, or Mr. A. E. Trites, Salisbury, N. B.

FARM HELP

A number of young men from 18 to 45 years of age are expected overseas during the spring months. Most of these young men have never farmed, but are willing to work in order to gain experience. There will also be a number of families all of whom have some capital. The inexperienced ones will want work on farms for one or more years. Any person wishing help of this nature, especially persons who have houses for those with families may apply to the undersigned.

F. E. SHARP,
Supt. of Immigration.
Box, 643, St. John, N. B.

SHORT COURSE AT MONCTON

The N. B. Department of Agriculture conducted a two weeks' Short Course at Moncton, commencing Feb. 16th and ending February 28th. The Course was held on the second floor of the Farmers' Co-operative Creamery Company's building, 578 Main St., and was under the direction of Agricultural Representative for Westmorland, Albert and Kent Counties. He was assisted by members of the Provincial staff at Fredericton. Valuable assistance was also rendered by the two representatives of the Ottawa Live Stock Branch located at Moncton.

This was the first course of this kind ever held in this section of the Province. As a consequence, considerable missionary work was necessary to have some of the boys sufficiently interested to attend. In all twenty-nine boys and young men ranging from fifteen to thirty years of age, were enrolled. It should be stated, however, that a number of these were only in attendance for part of the time, yet it was very pleasing to note that as the Course continued, the attendance became larger. Several farmers came in at different times when opportunities were afforded them and listened to the lectures.

The Course comprised studies of Live Stock Breeding and Feeidng, A Study of Feeds, Milk Testing, Poultry Production and Marketing of Poultry Products, Soil Cultivation, the Principal Farm Crops grown in New Brunswick, Crop Rotation, Apple Culture, Production of Small Fruits, Fertilizers and Farm Book-keeping. These studies took the form of lecture work supplemented with practical work in Live Stock Judging, Seed Grain Judging, Milk Testing, etc.

At the close of the Course, the formation of a Young Farmers' Club comprising the boys attending, was suggested by the Agricultural Representative who explained the object of the Club. The sugestion met with the unanimous approval of the boys and the organization became a reality with Mr. R. C. Mann, Butternut Ridge, Kings County, as President; Placide Robichaud, Lower Goguen, Kent Co., Vice-President, and John Bateman, Shediac, Westmorland Co., Secretary. The Department of Agriculture purposes interesting the members of the Club in conducting experiments, competitions, debates, agricultural picnics, etc.

A very successful Short Course held at the Office of the Agricultural Representative at Chatham came to a close on Friday afternoon, February 27th. The attendance averaged up well, and on one or two occasions upwards of thirty listened to the lectures. On Seed Fair Day, seventy farmers were present.

Chatham is a very suitable place for such a Course, owing to the fact that some of the very best Farmers and Livestock Breeders in the province live within the radius of two miles of the town. With this convenience, considerable time was spent on Live Stock. Lectures were also given by the various members of the Department, on the following subjects:

The Care, Handling and Testing of Milk.
The Growing of Small Bush Fruits.
The Farmers Apple Orchard.
Bee Keeping.
The Care and Handling of Pigs.
Soil Cultivation.
The Value of the Pure Bred Sire.
New Discoveries and Nutrition.
Lime and its Effect on Soils.
Breeding and Feeding of Poultry.
Co-operative Marketing of Lambs, Poultry and Eggs.

The lectures on Co-operative Marketing were given by the Maritime Representatives of the Live Stock Branch.

Prizes were offered for the best essay on the afternoon spent at R. A. Snowball's Hen House. The following are the prize winners:

1.—John Beattie, Nash's Creek.
2.—Roy Perley, Middle Island.
3.—Elvin McKenzie, Ferry Road.
4.—Clarence Wearle, Centre Napan.
5.—Stanley Bremner, Middle Island.
6.—Colin Shae, Ferry Road.

The Black River Agricultural Society kindly donated a sum of money to be used as prizes in Seed Grain Judging. he winers are as follows:

1.—A. M. McDougall, Hexham.
2.—John neBattie, Nash's Creek.
3.—Colin Shae, Ferry Road.
4.—Roy Perley, Middle Island.

A Junior Farmers' Club was organized with the following officers:

A. M. McDougall, Hexham, President.

Russel Murray, Bartibogue Bridge, Vice-President.

Clarence Searle, Centre Napan, Secretary-Treasurer.

Directors.—Claude Kingston, Chatham; John Beattie, Nash's Creek, and Stanley Bremner, Middle Island.

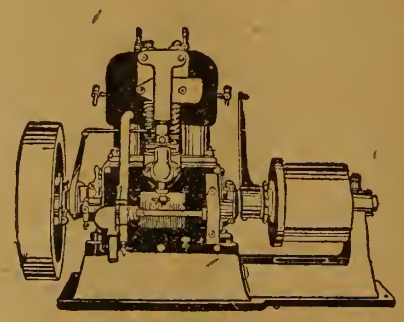
In about two or three months time, a Live Stock Judging Team will be formed to compete for a Silver Cup with the team from Moncton.

At the conclusion of the Course, the boys expressed themselves as well pleased, and a vote of thanks was passed to all who had helped to make the Course a success, and at the same time promised to boost Short Course Work with all their might, so that the one next year will be even a greater success.

There are two kinds of pure bred sires—good ones and better ones. A good pure-bred pays good dividends, but the better kind pays compound interest. The better the blood the better it will carry on down through the generations.

Farm science holds much for all of us—if we have eyes that see.

More Power Per Pound With Cushman (Light Weight) Engines



The weight of an engine does not determine the power it will give.

Cushman Light Weight Engines weigh only one-fourth as much per horsepower as ordinary farm engines—but they are guaranteed to deliver the full rated horsepower.

So well constructed, balanced and governed, they run more steadily and quietly than farm engines 4 or 5 times as heavy. It is the most practical engine for farm use—it can be easily moved from one job to the other—and attached to farm implements for work in the field. Every running part protected. No compression lost. Equipment includes Throttling Governor Carburetor, Friction Clutch Pulley and Water Circulating Pump.

If you want a good engine that is dependable, durable and accessible for all farm work, get the Cushman. Free booklet on engines sent on request.

WEIGHTS:

4 H. P.....Weight 196 lbs.
8 H. P.....Weight 320 lbs.
15 H. P.....Weight 780 lbs.
22 H. P.....Weight 1200 lbs.

Notes From the Nova Scotia Agricultural College

DAIRY COMPANIES IN ANTIGONISH COUNTY. ANNUAL MEETINGS

The four days March 2, 3, 4 and 5th were important days for the Dairy business in Antigonish County, being the days set apart by the four co-operative creamery companies for the holding of their annual meetings. They were held successively on those four days, so that outside authorities on Dairy matters could be secured and could attend them all in the one week.

The first was the annual meeting of the South River Creamery Company, at Loch Katrine, on Tuesday. The financial report here showed a turnover if $29,798.81 and a neat surplus on hand over the year's expenditures. Messrs. D. H. McPherson, Glen Alpine, G. F. McDonald, Middleton, and M. Cleary, Lochaber, were the three directors elected for a term of three years. Some progress was shown here for a number of years along the line of Herd Improvement, but practically none during the past year. It is expected, hiwever, that the milk producers will make a more determined effort during the coming year.

Wednesday, the Milburn Creamery Co. Ltd.. held their meeting in their new hall over the Creamery at Malignant Cove. Here a large number of the patrons and shareholders gathered together to discuss their years work.

The Sec'y.-Treas.' report showed a turnover of $22,521.24, and a substantial credit balance on the years work. The following were the three directors elected fo rthree years: John A. McDonald, McCara's Brook; Hugh Smith, Pleasant Valley and Ronald Smith, Big Marsh. This company showed a substantial increase in business over 1918, but practically no increase in the average production per cow. Much better things are expected as the patrons grasp slowly but surely the principles that go to make successful herd imporvement.

Thursday, The Intercolonial Creamery Co. Ltd., South River Station, held their meeting in the Pomquet Hall. The attendance here was small; due probably that it was a specially fine day for outdoor work, but it was regretted that many more did not attend, to show their continued interest in this business. The Sec'y.-Mgr's. report here showed a turnover of $54,-551.48 and the business in the best financial condition it has yet been. The three directors appointed were Joseph Boudreau, Pomquet; Simon Periault, Fraser's Grant, and D. W. Chisholm, Heatherton. A number of herds in this district were tested regularly during the year for milk and butter-fat production, and showed good returns as compared with the average herd that was receiving no special attention.

Friday, the Antigonish Dairy Co. held their annual meeting in the Agricultural Demonstration Building, Antigonish. The Sec'y.-Mgr's. report showed a turnover of $59,682.70 and the business in good financial condition. The directors appointed for three years were J. C. Chisholm, Edward Haley, F. R. Irish and Allen Beaton. Here, there was more evidence of the work that can be done through systematic and intelligent handling of the Dairy herd and the application of modern methods in herd improvement. One patron that had an average herd five years ago gave the figures of his herd average for 1919, which, with a fair sized herd, showed an average of about 8000 lbs. milk, 320 lbs. fat, value $192.00 per cow. When these figures are compared with the average earnings of all the four creameries, about $33.00 per cow, it shows something of the possibilities in Dairying.

At the last two meetings, Dr. Hugh McPherson, the Ciunty Representative of the Dept. of Agriculture, addressed the shareholders in the interests of cow testing associations, stating that he hoped to organize local Cow Testing Associations in every section in the County during the year, and emphasized the necessity of greater production per cow to make the business profitable.

At all the meetings Messrs. H. R. Brown, Provincial Dairy Promoter for the Dept. of Agriculture, Ottawa, and W. A. McKay, Provincial Dairy Superintendent, were present. Mr. Brown dwelt on increased production as the means to decrease cost of production; the influene of feed and breed upon increased production, and the part that Cow Testing Associations take in improving conditions of both. He also expressed his appreciation of Dr. McPherson in pushing the work forward in Antigonish County.

Mr. McKay took part in the general discussion throughout the meetings. He impressed on the shareholders that this is a critical time in the history of dairying, and that it is of the utmost importance that every one do his part in the development of the work. The shareholders, the patrons, the directors, all assume large responsibilities, which it is their duty to fulfil. The manager is the pivot on which the business centres, and his shoulders must carry a large share in the responsibility for the success or failure of the business. Mr. McKay also outlined the part the Dairymen's Association and the National Dairy Council are taking to assure the milk producer right and just returns for his labour.

All four companies enter upon the year with optimism and the determination that the work now so well begun shall continue until Antigonish County shall be among the foremost dairy Counties in Eastern Canada, a position for which by nature it is so richly endowed.

SEEING THE LIGHT

Lower Brighton, Mar. 5,1920
The Maritime Farmer,
Sussex, N. B.

Dear Sir:

The March 2nd issue of your paper cetrainly speaks some plain truths as to the manner in which N. B. farmers are being hoodwinked by the Western Grain Growers. I would like to put a copy of that issue in the hands of every farmer in N. B. It would prove an eye-opener to hundreds of farmers who believe every word the Westerners say.

I am enclosing a list of name of farmers in my immediate vicinity whom I would like to have mailed the March 2nd copy. Enclosed find Postal Note to pay for mailing same.

Keep up the good work and tell Maritime Province farmers just the kind of a gold brick they are being offered.

Yours truly,
(Sgd.) D. F. TEDLIE.

DAIRYMEN, THINK THIS OVER

In 1919 we had 4,775 patrons sending cream to the creameries of Nova Scotia. A closely figured estimate gives these five cows each, or a total of 23,875 cows, which averaged 91 lbs. of butter fat in the year, valued at $54.60 per cow. In one creamery the average was down to $29.84 per cow.

The best herd reporting, which sent cream to the creamery, was one of 15 cows. It produced butter fat to the value of $3,126.46, or, $208.43 per cow. The best cow at the College of Agriculture, Truro, produced 579 lbs. butter fat, which, at the average price paid by the creameries, 60c per lb., foots up $347.40 for butter fat alone.

Think it over! The average cow among the patrons of one creamery producing $29.84, the average cow among all patrons of creameries in Nova Scotia producing $54.60, and the best cow of which records are at hand producing $347.40, nearly twelve times the first average. Making all reasonable allowance for family use, etc., there is surely vast room for herd improvement, and for advance along every line of Dairy method, indicated by these figures.

Here is a motto for 1920,—
EVERY CREAMERY PATRON A KEEPER OF DAIRY RECORDS.

NOVA SCOTIA HEARD FROM

Allow me to congratulate you upon the stand you are taking in the interests of the Maritime farmers. I could not help but feel that we had some agitators at the Kentville meetings instead of promotors for co-operative efforts in the interests of the farmers in these Eastern provinces. I believe that Prince Edward Island is organizing more sanely in the interests of the farming community.

IMPROVED POULTRY FOR NOVA SCOTIA

The Poultry Department of the Agricultural College, Truro, has completed arrangements to secure several thousand day old chicks for Nova Scotia farmers and poultrymen. These chickens are to be shipped direct from a New England poultry farm to each person ordering in Nova Scotia. There is no duty on these importations, but Express charges must be added to the prices quoted. The lightest packages consistent with safety are used, and the following will be a guide as to cost of Expressage. Twenty-five chickens in box will weigh 4 lbs.; 50 will weigh 9 lbs.; 100 will weigh 17 lbs. Any Express agent can tell from this what the charges will be on a given order.

The breeds from which selection may be made, and the cost per chicken, are as follows:—Rhode Island Reds, 32c each, S. C. White Leghorns, 31c each, Barred Plymouth Rocks, 32c each, White Plymouth Rocks, 32c each, White Wyandottes, 32c each. The chickens will be shipped direct from the hatchery to the persons ordering them. Shipments will be made between March 15'th and May 31st. Post Office address and nearest Express office must be given with each order. The safe arrival of the chickens is guaranteed by this firm or the money will be refunded by them. Chickens should be examined before leaving the Express office. If they do not arrive in good condition a receipt should be taken from the Express agent stating the number dead in the box. When the receipt is returned to the firm, they will return the money or replace the dead chickens. This must be done promptly on the arrival of the shipment at the Express office.

This is a splendid opportunity to obtain some first class poultry and thus get into profitable production. Chickens obtained from this firm have been tried out in Nova Scotia during the past three years and have proven to be very satisfactory both in growth and in egg production. The firm states that this year's lot are of extra vigorous stock. Many parties who raise poultry on a small scale would do well to club with a neighbour or two in securing a shipment. No order smaller than twenty-five can be accepted, and special arrangements will be necessary on all orders over two hundred.

Cash must accompany all orders for these chickens, and must be in the hands of the Manager of the Poultry Department, Agricultural College, Truro, before April 15th. No order can be accepted after that date. Be sure that Express charges are added to cash accompanying order, and address Mr. J. P. Landry, Agricultural College, Truro, N. S.

"FOR HOME AND COUNTRY."

The Women's Institutes of the Annapolis Valley are taking a keen interest in the development of plans to care for the feeble minded. A vigorous Institute in a Cumberland County town is supplying hot lunches for the school children who come too far to lunch at home at noon. Others are working for School libraries, carrying on courses in Home nursing, providing clothing for the Infants Home at Halifax, and in various other activities giving evidence of their good christian citizenship. The Institute at Bible Hill recently enjoyed an exhibit of Motion Pictures, illustrating gardening and vegetable canning processes. Miss McDougall is now laying plans for a course in Home Economics for 'teen age girls to be given early in the summer, after the schools close.

DAIRYING.

WATERING COWS IN WINTER

There are two remarkable things about dairy cows. One is the enormous amount of water that a heavy milking cow will consume in a day, and the other the small quantity of drink that some cows can exist on, especially if they are dry or nearly so. That may seem a strange statement but it is not contradictory, as any farmer who has made a careful study of feeding dairy cattle will testify. Whole milk consists of about 86.4 per cent. water, and several United States dairy authorities claim that the average dairy cow requires almost four pounds of water for every pound of milk produced. What does that amount to per cow per day? According to the above figures a heavy milk cow on test would require 300 pounds of water per day and the average cow somewhat over 100 pounds. Part of that amount, of course, would be supplied in feed consumed, but the major portion would have to be accounted for from the farm well.

On the other hand cows that are not milking are able to exist on a very small allowance of water, in fact, it has been proven many times, that their requirements are just about one-fourth that of a milking animal of equal size and weight. That figures out about twenty-five pounds daily, according to the consumption of the average cow. That is not a very large amount, yet it is very necessary for the proper digestion and assimilation of food, but cows being creatures of habit they easily become accustomed to existing on less, if for any reason they have not free or proper access to the maximum supply.

What then is the proper method of watering dairy cows in winter? Should they be turned out daily to drink from a trough in the yard, or would it be better to have the water in the stable, and if so, what is the proper system? For cows that are dry and do not require a great quantity of water, turning them out daily does not seem to injure them any, and the method may have some advantages. It enables them to obtain exercise and fresh air, and considering the small quantity of water consumed daily by a non-milking animal, watering once a day should be sufficiest. However it is an entirely different proposition with milking cows, and no breeder can afford to take such chances as are incurred by turning out heavy milking cows on a cold winter's day. The fresh cow is liable to chills, and the arguments that are used in the cause of outdoor watering of dry cows, do not hold good in the case of their milking sisters. Take for example a cow on test, producing say 80 pounds of milk per day. As already pointed out, she will require some 300 pounds of water daily, but how is she going to consume that amount at one time, as she must do, if turned outside for water? Why, it is a physical impossibility, to say nothing of the effect of drinking so much ice cold water at one time. The results would be disastrous in spite of the greatest care. Then there is the matter of exercise, but that is easily accounted for in the energy required to produce a yield of 80 pounds of milk daily. It is not necessary that such a cow be chased around the straw stack a few times each day in order to keep her in perfect health, although we believe from practical experience that a certain amount of movisg about is beneficial, but that can usually be obtained by turning them into a box stall, or some protected shed. At any rate it is not necessary to turn such heavy milking cows out every day, regardless of the weather, in order that they may retain the equilibrium of their limbs.

Granted, therefore, that dairy cows should be watered inside the buildings, what is the best method of supplying it to them. Should the continuous trough or manger be used, or individual water bowls installed for every pair of animals? The former methods have some advantages, it is true, especially the continuous trough, but the practice of running the water in a continuous manger does not appeal to us as a satisfactory or a wise policy for any farmer to follow. It is always sloppy, inconvenient, does not permit the chill to escape from the water before the cows start to drink it, because it cannot be left in the manger except at certain hours, and, furthermore, it is a direct carrier of tuberculosis. In regard to the latter, the continuous trough is also a disease carrier, but it enables the herdsmen to keep a supply of water in front of the animals at all times, thereby eliminating to a great extent the icy chill so common on water drawn from a well or storage tank during the winter months. The individual water bowls overcome most of the above difficulties. They prevent the spread of tuberculosis through the drinking water and since they work automatically there is always a supply of water exposed to the warm stable air, consequently the chill is removed to a very large extent. They are more expensive to install, but they save a tremendous amount of labor and once installed require but little attention unless the stable is so cold that they are liable to freeze up. They supply water to the animals at all times, a very important item in the care of dairy cattle, and in a herd where winter dairying is carried on there appears to be no economic argument against the use of individual water bowls.

Healthy Live-Stock Pay Big Profits
Cows give more and richer milk, Horses work better, and Hogs fatten more quickly when
Pratts Animal Regulator
is added to the daily ration.
For nearly 50 years, Pratts has been recognized as the one reliable stock tonic and conditioner that always brings good results and never injures the stock.
Pratts does not force development at the expense of the animal's health. It acts gently and surely on the digestive organs, tones up the entire system, keeps the blood cool, the bowels free and the general health at top notch all the time.

Pratts

Hogs sold off Canadian farms in 1919 exceeded $80,000,000 in value. More than 40 per cent went direct from the farm to the packing plants.

Singlehanded neither the farmer nor the packer can expect to enter the vast field for exports; only by the united efforts if both can it be done.

The Minister of Agriculture, Hon. Dr. S. F. Tolmie, in an effort to encourage the raising of more livestock, points out that the export of Canadian meats must help to pay the nation's war bill.

Canada exported to Great Britain in 1918 only about 2¼ per cent of the total importation of beef there. During the past six months there has been practically no export of beef—a fact touching production and marketing that should receive the joint attention of farmer and packer.

A cent up or down in the wholesale price of hides makes a difference of 14 cents a hundredweight for the beef. In old-fashioned butchering hides were often partly spoiled. In modern packing eight or ten experts take off each hide. This specialization gives a better grade leather and enables the farmer to get a better price for livestock than the local butcher can pay.

As long as we make good butter the dairy industry in Maritime Canada has a splendid future. The production of poor butter means that the people will turn to substitutes.

When honest men look back over the past they can conveniently see where they could have done some things better, grumbled less in doing them, or judged with more charity those with whom they were associated.

THRIFTY, LUSTY CALVES

TO raise calves that are profitable, that make good beef or become a valuable addition to your dairy herd without the use of milk is possible through the use of

INTERNATIONAL GROFAST CALF MEAL

Grofast makes a pleasing and nutritious gruel, eagerly eaten by calves, making them grow sleek, thrifty and lusty. When compared with new milk the cost is infinitely less—yet the results are equally as good.

Grofast Calf Meal is endorsed by thousands of successful breeders throughout Canada as the finest substitute for new milk. Try it yourself—you will be more than pleased with the results.

Sold in 25, 50 and 100 lb. bags. For guaranteed results demand Grofast and refuse substitutes.

Dealers everywhere sell GROFAST. Or write us.

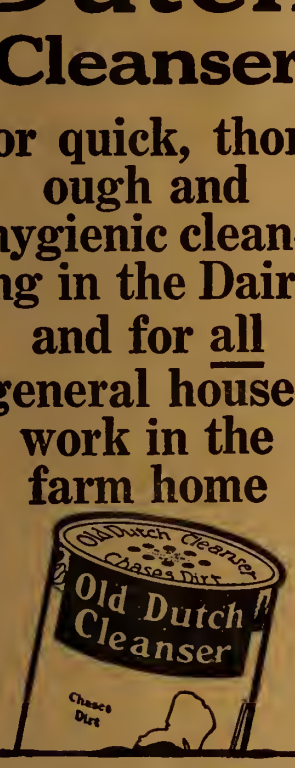
Use

Old Dutch Cleanser

for quick, thorough and hygienic cleaning in the Dairy and for all general housework in the farm home



secy. Brook Hill Farm, Wis., are a few of the thousands who give testimony to the value of clipping. These men represent three of the largest, best operated and most successful dairies in America, and their recommendation re clipping, coming unsolicited, should be sufficient to dispel any fear or doubt that may still linger in the minds of any dairymen.

The advantage of clipping cows is not confined solely to the possibility of producing better milk, but it also aids in keeping the cows clean. In fact, it lessens that end of the work by about seventy-five per cent., a fact readily admitted by anyone who has had any experience in caring for clipped and unclipped cows.

There is no use arguing the point that unclipped cows cannot be kept clean—they can, but the cow that will require five or ten minutes' vigorous brushing to make her look anything like clean, can be done equally as well in two or three minutes if her head, neck, and hindquarters are clipped. The hair being short the small particles of manure that are almost certain to become attached to the cow's thighs, even in the cleanest stable, do not obtain a firm hold, and it is but a moment's work to brush her clean again. It is the same with the dust that accumulates so fast. A moment's brushing will clean a clipped cow, whilst it requires several minutes to go over an unclipped one.

However, in order to keep cows cleas it is not necessary that the whole body should be clipped. That requires considerable time and if the cows are properly tied in their stalls it is not necessary. By that is meant having them tied in such a manner that they are enabled to turn their heads around and lick themselves, and any contrivance used for tying cattle that does not permit of such action is not a fit equipment to use on any beast—it is unhuman. If the thighs, udder, rump, head and neck of a cow are clipped the work of keeping her clean is very little more than if her whole body had been gone over. Of course the animals do not look as attractive as when they are clipped all over, but a good man with the clippers can make a real nice job after he gets on to the way of doing it. A little patience, a steady hand and a good power clipper are all that is required.

As soon as the herd is stabled for the winter the udders and hindquarters of the animals should be clipped. It may be necessary to make about two trips over before the work is completed. First the rear parts (those more susceptible to dirt) are done and later the heads, necks and a little trimming along the back completing the job. The whole performance is repeated again about March, with possibly an occasional trimming up of the thighs, flanks and udder between times. At any rate the work does not take long and the ease with which it is possible to keep that herd clean is sufficient to pay for many more clippings than they receive. The young heifers and bulls that are running loose in the box stalls should be trimmed up from time to time, as it improves their appearance, thereby making it easier to sell them.

In short clipping the dairy herd is an advantage but it must be done before the animals become dirty. There is nothing that will ruin a clipper faster than trying to clip around where even a little manure has become caked or a mat of dust has become bedded in the hair. If the work is not done early in the winter it requires a lot of cleaning before it can be attempted later on. In fact, washing the dirtier parts with warm water may have to be resorted to if the work is to be done satisfactorily, but nevertheless we are firmly convinced that clipping is a paying proposition both from the standpoint of labor and sanitation.

CLIPPING DAIRY CATTLE

There are few men in the dairy business who are better known than David Gibson, herdsman for the famous Strathglass herd of Ayrshires at Port Chester, New York. Dave is Scotch, possesses a fund of humor, knows a good cow and hails from Kirkcudbright, Scotland. He is a past master in the art of caring for dairy cattle, and there are few men on this side of the "herring pond" who keep their charges in better condition. The milk from Strathglass is sold as certified and ranks as about the best produced in the State of New York. Dave was recently asked how he managed to keep the cows so clean and the bacterial count in the milk so low, and his reply was a most interesting one: "Clip your coos, mon, it is impossible to produce certified milk if you don't; it should be made compulsory."

In that regard Dave is not alone, but has an able seconder in most every stable where clean milk is being produced and any particular efforts are put forward to keep the animal clean. Geo. Murphy, Supt. Sunny Beach Farm, Conn.; E. P. Brown, Supt. Louden Hill, Farm, Pa., and H. T. Green,

De Laval Service covers the continent

This map shows how completely the service of the De Laval organization reaches every community

Every separator user realizes the importance of having his separator in use every day. Delays waiting for parts, with a separator out of use, mean great inconvenience and loss of product.

Every dot on the map represents ten De Laval agents, and every De Laval agent is individually trained to assist his customers in setting up and operating their machines, to furnish and put in place repair parts, and to ensure prompt service and satisfaction to De Laval users.

Not only is the De Laval Cream Separator superior in all points of separator efficiency, but every user of a De Laval is assured of prompt and competent service for all the years to come.

It is therefore not surprising that there are more De Laval Separators in use than all other makes combined. Now is a good time to begin saving time and product by securing a De Laval.

The nearest De Laval agent will be glad to demonstrate a De Laval. If you do not know his name, write to nearest De Laval office.

LIVE STOCK.

THE LIVE STOCK MEETING

By Hon. W. M. Lea, Charlottetown

During the first week of February practically all of the pure bred live stock associations of Canada met at Toronto to hold their annual meetings. Hundreds of prominent stock men from every province of the Dominion met daily in consultation over the various problems that were of interest to their particular breeds. Brother breeders from the far east and west rubbed shoulders, told stories, exchanged experiences, and became acquainted with conditions in each other's land; a good spirit of fellowship maintained throughout the entire series of meetings, encouraging increases in membership and in registration and transfer of ownership of animals of nearly every breed was reported, showing the deep interest being taken in the breeding of improved live stock. Demand for high class animals was never so great, showing that breeders, feeders and producers of all classes of animal products are fully alive to the importance and economy of using only breeding animals that have been bred and raised for special purposes. These are the men who are doing big things for Canada. The value of the improved blood sent out into every part of the Dominion by these men each year is almost inestimable; these are the men who are largely responsible for the increasing yearly average of production of our dairy cows, of the increasing quality of our wool and mutton, of our improved bacon hogs and all other animals of our farm. Progressive programs were adopted for 1920, one of which was the voting by the Holstein and Shorthorn Associations of one third as much money as was offered by any provincial exhibition to their breed; that is, special prizes, equalling one dollar, for every two of the fair board for these breeds. Those men evidently believe that provincial agricultural shows are worth while; they are men who fully understand the benefit of breeders meeting in yearly competition and the encouragement given by such competition for the further improvement of stock owned by such men. This, they are fully aware, is the best possible means of keeping the breeders keyed right up to the limit in seeking still better sires. And when they as a body vote to yearly expend the greatest part of their surplus for such purposes, it should convince the few sceptics that there must be something of great value in connection with a provincial or interprovincial exhibition. Pure bred and high grade stock are selling today as never before. Every intelligent farmer is either raising them or endeavoring to get into line. No scrub sire should be tolerated longer. If improved animals are more profitable, why not raise them, and if a pure bred sire is half the herd or flock, why not by the purchase of one have them half pure at least.

THE PROPER CARE OF ANIMALS

Animals properly cared for will give much better returns on your investment than neglected ones. And no one thing in their proper care shows better results in thrift and returns than the regular use of Herbageum and at a cost of only five-sixths of a cent a day for each horse, cow or pig. It enables one to use a greater amount of roughage thus saving expensive feeds, and without loss in returns.

It keeps animals free from vermin so that lice killers and sheep dips are unnecessary. It is the best thing known for calves and a 4-lb. package will make one ton of skim or separated milk equal to new whole milk for calves. The bone, flesh, muscle and nerve qualities are in the skim milk and the Herbageum ensures its assimilation. Do not waste money on Calf Meals simply add to 400-lbs. of ground oats or any good meal or mixture of meals, 4-lbs. of Herbageum and 1-lb. of fine salt. Mix well, stir about two cupfuls in a gallon of scalding water and feed warm.

If you cannot buy Herbageum where you deal, the Beaver Mfg. Co., Ltd., of Galt, Ont., will send to any Post Office in Canada, a 4-lb. package by registered parcel post for $1.40, or will deliver freight prepaid at your station 50-lbs. for $12.00 or 100-lbs. for $23.00. In all cases Cash with order.—Advt.

DOES THE FALL LITTER PAY?

There is much discussion as to possible profits to be obtained from the fall litter particularly when farrowed late.

A sow farrows on April 1st., nurses a litter six weeks, is bred a few days after and farrows a second litter in early October. Where facilities are present for earlier farrowing of the first litter the second may be benefitted by August or September birth. During the summer, of course, the sow must have extra care, preferably on a pasture of clover and, later, rape, with plenty of shade, a wallow, occasional applications of oil to kill lice, and a light meal ration of strength, quantity and frequency of feeding dependent upon her pasture opportunities. If she does not get this good care after having nursed her first litter faithfully, her second litter will likely be a disappointment,—few in number, small, weak, and unthrifty. Further, if she is much pulled down, when bred after weaning her first litter, her second litter will be unprofitable, in any case, no matter what her summer care.

So that much of the disputed success or profit from the second litter depends on the proper attention to the above preliminaries,—breeding the sow only when she has recuperated, even at the expense of a litter later in farrowing, and giving her special attention during the summer.

For the fall farrowed pig needs every aid and no handicaps. The man who can unfailingly carry through the winter a fair percentage of September and October pigs is a true and tested hog breeder. For, give such pigs fairly warm quarters; they get runty, pot-bellied and hump-backed; develop rheumatism, cripple and pass out after having been a nuisance to themselves and their feeder. Give them a colder pen; they act as above, only more so; they pile in a steaming heap, or burrow into the damp straw. There is no more God-forsaken creature than a poor-doing fall pig in January.

Apparently, the radical method of outdoor housing as used for breeding stock may be adopted for the fall farrowed pig, in a modified sense. Where a sow can be given the use of a dry, open shed in a corner of which is made a low straw-covered sleeping berth, well bedded inside, and where she can wander about a barnyard with her charges until they are weaned, the pigs become hardened or used to the gradually increasing cold. Provided their sleeping pen is dry—little crippling will ensue. If they have been supplied during the later stages of the nursing epriod with a "creep" containing a small self-feeder and a trough of skim milk, little check will be evidenced at weaning. They may be carried on through the winter on the self-feeder with a warm sloppy drink daily and a supply of earth, ashes and charcoal. From evidence available at Ottawa during the past two years, this system of management will result in less mortality than any other. The dry quarters, exercise in the barnyard and the self-feeder as a constant source of nourishment are apparently responsible.

BEWARE of a meal ration with too much fibre!

Ground oats, 2 parts, or one part each of barley and oats; shorts, 2 parts; ground corn, 1 part; oil meal, 10%, constitutes a good ration for the growing pig. Elevator screenings, if of high quality, may be added at four months of age and the corn increased considerably as the pigs near the finish. Milk in some form is the best feed of all. Failing this, tankage may be supplied in a box or small self-feeder. Clover or alfalfa hay in a small rack will be greatly relished and is a cheap winter supplement, too frequently forgotten. Ashes, charcoal, sods, earth, etc., are very necessary. Such hogs should be ready for market in April or May, when there is usually a good demand.

In brief, the fall litter is all too frequently a losing proposition. By exercising care in the breeding of the

INTERNATIONAL STOCK FOOD TONIC

How has Winter Affected Your Stock?

Winters are hard on stock, and the most trying time is when Spring approaches. After dreary months of inactivity, animals, like humans, need a good tonic to give them new life and vigor while awaiting the freedom of Spring. Successful stock breeders depend on International Stock Food Tonic as Nature's substitute. It is the ideal Spring corrective, and is economical; providing

3 FEEDS FOR 1 CENT

It is endorsed as invaluable by breeders all over Canada, and the following testimonial is typical of hundreds received.

Calumet Island, Que.

Dear Sirs:
I have been using your International Stock Food Tonic on my horses, cattle and hogs all winter; it is certainly a great blood purifier and tonic. My stock are in as good condition as they would be in the summer months. I would not want to be without International Stock Food Tonic again. (Signed) W. J. DEROCIUR.

Sold by all dealers. In convenient packages 30c, 60c, $1.20 and $1.75 tins, also in 25 lb. pails at $3.75

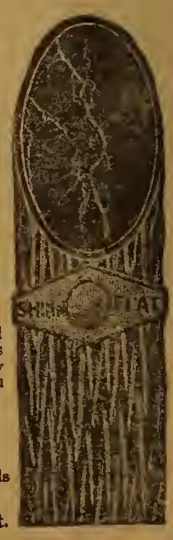
Shinn-Flat

Lightning Rods

Are scientifically the nearest approach to absolute protection that has ever been devised. Their form gives them 36% greater electrical carrying capacity than old style round cable of the same weight and number of strands—putting them in a class by themselves and making them much easier to sell. There is no competition for Shinn-Flat.

Lightning Can't Strike if Shinn Gets There First



We want good dealers who are interested in a specialty line that sells readily and affords a good margin of profit. Every property owner is a prospect. Ask us how we help you get started.

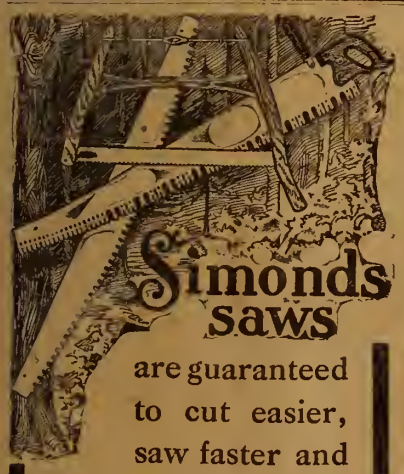
sow and in her summer care,—by housing her and her litter as suggested in the late fall and winter,—the fall litter may be made a profitable "side line" without interfering with the sow's chances for her main effort,—the spring litter.—G. B. Rothwell, Acting Dominion Animal Husbandman.

DETERMINING AGE IN SHEEP

The number of years of usefulness of a ewe will naturally depend somewhat on the care she receives, together with the natural constitutional vigor possesses by the animal. As a rule, a ewe at five years is beginning to show age as indicated by the loss of teeth or as is commonly known, broken mouth. Once a sheep has lost the greater part of her teeth she might better be sent to the butcher as she is not able to make the proper use of her food. Keeping in mind that the ewe is at the best only useful for a comparatively few years, it is important to be able to determine their age accurately. Further, as a basis for culling it is desirable to have this information. The appearance of the teeth is a pretty reliable indication of the age of the sheep. The lamb shortly after birth is in possession of a full set of milk or temporary incisor teeth, four pair. These differ from the permanent teeth, in that the milk teeth are much smaller, narrower and whiter than those that follow. When the lamb is from 12 to 14 months old the middle pair of milk teeth are replaced by the permanent teeth, at two years to 28 months the second pair—one on either side of the first pair—appear. The third pair appear at from three years to 38 months and the appearance of the fourth and last pair is when the sheep is approximately four years old. The date of the appearance of the different pairs of teeth as mentioned may vary somewhat, depending upon the development of the lamb. In other words, a lamb that has been pushed along say for show purposes will sometimes have their first set of teeth before they are a year old, on the other hand, a poorly developed lamb may not get its first pair until 18 months old. There are also cases on record where a yearling has shown a two-year-old mouth. However, the ages established on the method outlined, although not absolute, are approximately correct.



are guaranteed to cut easier, saw faster and stay sharp longer than any other brand of saw at any price. S-56-1

DUAL PURPOSE COW WILL BE BOOSTED

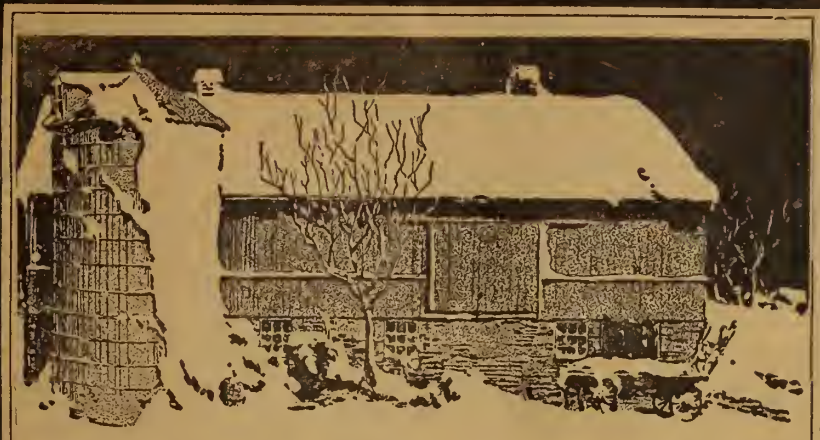
The Dual Purpose Shorthorn Club lately formed for the purpose of promoting the interests of this strain of cattle in Canada, held its first annual meeting in the Carls-Rite Hotel, Toronto, on February 2. The first day of the Annual Breeders' Convention, Mr. G. Smith, Meadowvale, Ont., occupied the chair, and explained the objects of the club, which had been formed to encourage the breeding of Shorthorn cattle with milking qualities for the dual purpose of supplying beef and milk, to hold exhibitions and sales of live stock and to provide prizes and premiums for competition amongst breeders, to establish a register or record of milk production and to grant certificates or records thereof.

A board of directors was appointed with Mr. G. L. Smith as president and Mr. I. B. Whale, London, Ont., secretary. The club will later be affiliated with the Dominion Shorthorn Breeders' Association.

In addressing the meeting, Prof. Barton, Macdonald College, said it was high time that the dual purpose cow was placed on the map, and that there was no possibility of doubt in regard to her utility. He warned breeders of the dual purpose Shorthorn not to fall down on the extreme dairy type in their choice of animals for breeding. As a pure dairy cow they were not naturally fitted.

In discussing the standard of many of the bulls noted among Dual Purpose Shorthorns, he said there were far too many plain headed animals and a plain head gave an indication of other plain features. There was a co-relation of character that was found in other breeds as well, that had the plain headed fault. The three things to judge the animal by were character, substance and type.

Prof. G. E. Day, Guelph, Ont., advocated keeping the Dual Purpose Shorthorn as near the typical beef Shorthorn as possible, and gave instances of Scotch topped cows, in Canada that had records of 10,000 and 12,000 lbs. of milk. He advised breeders of the Dual Shorthorn to get away from long legs, long heads, and long necks, as they usually accompanied, short-ribs and weak constitution.



Now is the time you need an IDEAL GREEN FEED SILO

It provides succulent feed during the cold winter days, which enables the cows to give 25% more milk than if they were fed on a dry feed ration. And a silage ration is considerably cheaper than a dry ration.

At the present high prices of milk and butter-fat, no dairy farmer can afford to go through another season without a silo. Soon the rush of spring work will be on and the question of getting a silo may again be sidetracked.

Plan for your silo now

An Ideal Green Feed Silo will make better silage than any other silo, and will last longer. Thousands of Canadian cow owners have proved this to their own satisfaction.

Write to nearest office for catalogue, which describes the Ideal Green Feed Silo and gives valuable information about silage.

LIVE STOCK NOTES

The Dominion Live Stock Branch announces a new policy to be known as the "Sire Purchase Policy" which will become effective in the different provinces as announced later.

Under the term of this policy bulls, boars, and rams will be purchased on order by competent employees of the Branch, and will be sold to applicants at the original cost price plus the freight. A deposit of $50.00 with the order will be required in the case of bulls, and of $10.00 in the cost of boars or rams. An applicant will be required to remit the balance of the purchase price either direct or through his bank before delivery is made.

In the event of a considerable number of applications being received from any one territory, exchange stables will be provided by the Branch for the assembly of the sires with a view to executing orders more promptly, and for the purpose of giving applicants an opportunity of making their own selection out of the number on hand.

Roundly 2,332,400 hogs were slaughtered at Government-inspected packing-houses last year. The increase of 72,000 on the previous year came wholly from Ontario and Quebec. Numbers from the West dropped.

Bissell Silos

Maximum results with beef or dairy cattle are impossible unless regular rations of green fodder are supplied. The Silo saves hundreds of dollars' worth of green feed, which can be fed when summer pastures are dried up, and in winter. We make Silos in popular sizes, air-tight, substantial, with all practical improvements. Pine or spruce staves preserved in creosote oil, two-step doors; steel hoops; every item and arrangement is correct. Bissell Silos are the best for the money. Let us prove it. Consult us freely. Literature and prices on request.

THE HORSE

CARE OF HORSES' FEET

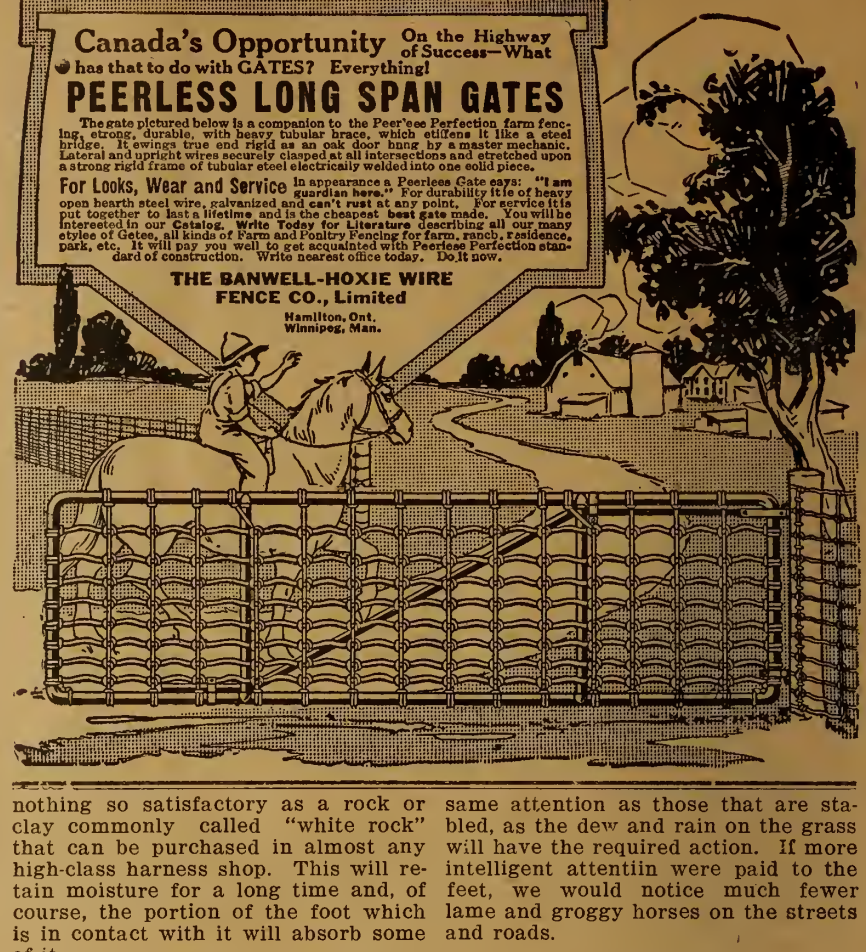
Every horseman recognizes the importance of good feet in a horse. There is a great deal of force in the old adage "No feet, no horse." While some horses have congenitally weak feet, and require very careful usage to prevent disease, many go wrong in their feet as the result of careless or ignorant treatmnt. The foot of a horse is a complex organ, and subject to many diseases, the causes and symptoms of which we cannot discuss in one article, hence will discuss only the means of preventing disease.

The main object to be observed is the keeping of the feet in as natural a shape and condition as possible. There is, under normal conditions, a constant [illegible] of all the horny or [illegible] on-vascular parts of the foot, as the horny wall, horny sole and horny frog, and we can readily understand that if there be not an equally constant waste, the organs will assume an abnormal size, and as a consequence become ill-shaped. Of course, during youth, while the animal is growing, the growth of the feet, like that of other organs, exceeds the waste, hence they increase in size. In the state of nature the natural wear and tear on the unshod foot equals the ordinary growth, hence keeps it in proper shape and of proper size, but, owing to the artificial manner in which horses are of necessity reared in cold climates, their feet require more attention than they frequently receive. Interference is seldom necessary, until the first winter, as during the summer months when the colts are at large the natural wear will suffice, but when the weather becomes cold and they are kept in the stable the greater part of the time, often in stalls that are not regularly cleaned out, (which state favors the growth of horn) the wear becomes infinitesimal, and unless attention be given, the feet become abnormally large, deep in the heels, long in the toes, and abnormal in shape to such an extent as to render it impossible for the animal to stand or move naturally. This condition abnormally increases the tension on some of the tendons and other ligaments and correspondingly decreases that of others. If this is allowed to continue the ultimate value and usefulness of the animal will be affected. In order to prevent this the feet should be pared or rasped down to the normal size and shape every few weeks during the period of stabling. The heels should be kept well pared down, the wall rasped off on the bearing surface all the way around, and the toes not allowed to become too long. It is not often necessary or advisable to pare either the frog or the bars. In order to avoid thrush or other diseases from an accumulation of filth, the sole and the cleft of the frog should be cleaned out daily by the use of a foot-hook. In the spring we often notice colts with long toes, deep heels, and with the lower margin of the wall turning inwards. In such cases the owner probably thinks it wise to have the feet trimmed before turning them out to grass. When a foot is lifted and the sole cleaned out, preparatory to trimming, it will be noticed that the frog is narrow and shallow and often there is a foul-smelling discharge from its cleft. This is due to neglect of regular attention, and, as the frog should be large and strong, and so deep that it presses upon the ground when the foot is planted in order to support its proper share of the animal's weight and tend to prevent contraction of the heels, it can readily be seen that anything that tends to a decrease in size, ir prevention of development of this important part of the foot is a serious matter. The feet should have regular attention until the time arrives when shoes are required, after which the shoeing-smith will cut and rasp away at each shoeing a sufficient amount of horn to keep the foot of proper shape and size. The intelligent horseshoer is careful to not cut the bars down nor pare any off the frog or sole, except portions that become partially detached. Horse owners should see that there is not too much rasping and cutting down in the shoeing-forge.

The shoes should be removed and reset, or new ones put on, at longest every six weeks, in many cases every four weeks. During cold or damp weather no particular attention is required other than having the shoes removed regularly and cleaning out the feet daily, but in dry, hot weather, horses that are kept in the stable should have artificial moisture supplied to their feet. During the seasons when the roads and fields are hot and dry, and the stable floors in a like condition, unless sime means be taken to supply moisture to the feet they also become dry and hot, and this predisposes to disease.

Moisture can be supplied by the use of a soaking tub or soaking,boots, standing in wet clay, or packing the sole with any substance that has the tendency to absorb and retain water. For the purpose there is probably nothing so satisfactory as a rock or clay commonly called "white rock" that can be purchased in almost any high-class harness shop. This will retain moisture for a long time and, of course, the portion of the foot which is in contact with it will absorb some of it.

There are a great many "hoof ointments" advertised and highly recommended, and while some of them may be of some value (at least in improving the appearance of the feet) there is nothing quite as valuable as water for supplying the necessary moisture. Horses that are on pasture a few hours or longer daily, do not require the same attention as those that are stabled, as the dew and rain on the grass will have the required action. If more intelligent attentiin were paid to the feet, we would notice much fewer lame and groggy horses on the streets and roads.



Canada's Opportunity On the Highway of Success—What has that to do with GATES? Everything!
PEERLESS LONG SPAN GATES
The gate pictured below is a companion to the Peerless Perfection farm fencing, strong, durable, with heavy tubular brace, which stiffens it like a steel bridge. It swings true and rigid as an oak door hung by a master mechanic. Lateral and upright wires securely clasped at all intersections and stretched upon a strong rigid frame of tubular steel electrically welded into one solid piece.
For Looks, Wear and Service In appearance a Peerless Gate says: "I am guardian here." For durability it is of heavy open hearth steel wire, galvanized and can't rust at any point. For service it is put together to last a lifetime and is the cheapest best gate made. You will be interested in our Catalog. Write Today for Literature describing all our many styles of Gates, all kinds of Farm and Poultry Fencing for farm, ranch, residence, park, etc. It will pay you well to get acquainted with Peerless Perfection standard of construction. THE LAWRENCE-WILLIAMS COMPANY, Toronto, Ont.

put him in pasture, feeding him a gallon of oats night and morning, and put him in at night. When sheaves got dried out, I changed him to a sheaf of new oats instead of a gallon of old oats, also left him out at night instead of in the barn. Two days after he would not eat his sheaf, and would stand for an hour or more in one spot with head down and ears drooped; would drink plenty of water, but seemed to urinate very often; urine was a clear yellow color. I put him in at night giving him oatmeal gruel and three tablespoonfuls of Watkins liniment twice a day as a drench. On the third day he seemed pained as if he had a mild colic, gradually getting worse, and very stupid sometimes, trying to climb the walls. On the fourth day I was compelled to put him into the pasture lest he might kill himself against the manger. He continued lying down and getting up, then walking from one place to another in a feeble manner for about two hours when he could not rise but died in agony.

Answer—While it is not always possible to form a correct opinion as to the cause of death without an examination, it would appear from the symptoms described that death in the case of this colt resulted from what is known as embolism, or the blocking up of a blood vessel as the result of certain palisade worms, which find their way into the blood vessels, particularly those of the bowels. Worms of this kind, when present, are frequently the cause of death.

URENIC POISONING IN FOAL

W. B.—"Pure-bred Clydesdale mare has lost her foal for two years in succession. Symptoms were the same in both cases. Foal is extra large, but normal in all other ways. Gets on his feet in about thirty minutes after birth, strong, active and well nourished; in fact, fat. Is not inclined to suck the first day, but by the end of the first day is taking some. Bowels clean out nicely. Second day becomes dull, does not urinate, not inclined to get up. By the end of the second day is stiff fore and hind, and the heart is beating too fast. Fights in his sleep with the fore feet. Takes some nourishment with assistance. Third day, inflammation showing the eyes and the colt dies. Mare is in medium flesh, running on pasture. Gave her bran for three weeks before foaling. Is it possible for a large foal like this to injure himself in breaking the navel cord? No attendant with mare at foaling; usually let them break the cord."

Answer—The symptoms given point to "urenic poisoning," due to absorption of certain deleterious substances contained in urine. The causes of this condition are numerous, the most likely among them to cause the trouble being infection through the umbilicus. The resulting inflammation would thicken the musos membrane lining the urethra and so occule the tube, or the occlusion may be congenial. In the latter case, unless relief can be obtained by operation, nothing can be done. In the former the treatment is principally preventive. The stump, although short, should be disinfected with a strong carbolic acid solution, or, tincture of iodine, then tied tightly with a piece of cord which has been boiled and soaked in carbolic solution; then the stump is again disinfected. It should be disinfected every day until it drops off. The surroundings must be sanitary. All soiled bedding, etc., should be burnea, and the stall thoroughly disinfected with lime wash and strong creolin solution. It may be that this mare is a carrier of the germs of navel ill, and consequently infects her foals. As a precaution she should be isolated from other pregnant mares and foals. So also should her foal be isolated, if she is bred again.

MARE THAT HAS GOT HIDE BOUND

(1) I have a six-year-old mare that is hide-bound; she is losing flesh, but has a good appetite, and is not apparently sick. I feed her on good hay and she gets a gallon of oats per day, with enough work to give her exercise. What is the matter with her?

(2) Is cribbing injurious to a horse and can it be remedied? W. C.

Reply: (1). The symptoms you describe as seen with your mare point to a condition that is caused by intestinal worms. They are of two varieties, one living in the intestines proper, and the other in the rectum. The former are not unlike the common earth worm in size; the latter is much smaller and resembles in size and color a piece of white thread an inch long. Give your mare a purge and watch the feces for worms. A good purgative is made of aloes eight drachms, one tablespoonful gentian, and half a pound of molasses, mixed in a pint or so of hot water and allowed to cool before giving her the drench. Should any parasites of either kind be found, give her oil of turpentine, two ounces; oil of male fern, one drachm; linseed oil, half a pint. Give her this on an empty stomach. Add a daily bran mash to your oat ration after the treatment above advised has done its work.

(2). Cribbing is incurable, but it can be partially controlled by wearing a tight strap on the neck. This will encourage the animal to start and eat when coming in from being unhitched. Cribbing horses are liable to continue the habit and neglect to eat. An animal that cribs should not be bred, as it is hereditary.

SWEENEY—TUBERCULOSIS

R. J. R.—"(1) Eight-year-old mare was badly sweeneyed about six months ago in both shoulders. Blistered her, but the shoulders have not filled iut. Has not been worked all summer, but need her now for fall work.

Answer—(1) Do not blister again. You should have put her to work immediately after the blistering, then the muscles would have filled out more or less. The irritation set up by the blister causes a large amount of blood to be sest to the part, then the exercise induces the atrophied muscle to take up the surplus blood and reparative material brought there by the blistering, and so repair takes place. Have a properly fitted collar made for her and put her at light work.

J. K.—Four-year-old horse was put to work last spring. He keeps in good condition and eats well, but he is given to swelling in the hind legs. Will you please inform me what is the cause of the swelling, and give the treatment to cure and prevent same."

Answer—This horse is affected with what is commonly known as "stocked legs." Some horses are predisposed to this condition and readily become affected, unless carefully fed and regularly exercised. It may be caused, in some cases, by feeding too much grain, resulting is attacks of lymphangitis, or from faulty action of the kidneys and bowels, preventing removal of waste products from the system. It also sometimes results from neglected cases of scratches or cracked heels. The best means of prevention and treatment is to feed moderately and exercise regularly. The bowels and kidneys should be regulated by feeding bran mashes at least once a week, asd by giving a tablespoonful of saltpetre in the feed or water, or a handful of Glauber salts may be added to the bran mash.

IMPERIAL HARNESS

IMPERIAL BRAND HARNESS is guaranteed free from all defects in workmanship and materials. You are certain of satisfaction when you buy a set of harness made by Trees & Company.

No. 640, Team Harness, is especially designed for farm work such as ploughing, seeding and general hauling. Exceptionally good value at a very low price. Blind Bridles with side check; lines one inch; high top hames; traces, steel chain, leather covered; pads with hook and terrets; backstrap with trace carriers riveted on top. White metal or japanned mounts, less collars. Price $57.00

Sold by the Harness Trade throughout the Dominion. If your dealer will not get Imperial Harness for you, write direct to us for Catalogue and prices.

POULTRY.

GIVE THE HEN A FAIR CHANCE

Give the hen a chance if you want her to lay large, rich eggs in the cold and dreary days of winter. It's a mighty poor hen that will not lay in the summer, the natural laying time, but it is a might good one that will lay many eggs during the cold winter, except under the most favorable conditions. This does not mean pullets as particularly as it does old hens, though it still applies to a certain extent. But an early pullet of a good breed and from a good laying strain will lay through the winter in spite of difficulties. The old hen who has just pasesd through the molting season will not do it, and can not reasonably be expected to. But if she has any kind of breeding, she can be made to lay with proper attention to her physical requirements.

Fresh air and plenty of it is absolutely essential to the good health of human beings, and this is equally true of the faithful biddie. Fresh air does not mean cold air; it means pure air fresh from out-of-doors. No hen that is hived up in a close house is given half a chance to show what she can do. I have travelled over much of the country during the past autumn months, and one of my interests being in poultry, I have paid particular attention to the poultry houses, and going over the country roads in an automobile one sees most, or at least many of them. In my opinion, not one in ten of the hundreds of houses I have seen was properly built. Not one in ten would admit a sufficient amount of fresh air at any season of the year.

Fresh air does not mean a draft—far from it. A draft is as dangerous as a tightly closed house. Either will lead to disease, discomfort, nonproductivity and death. Very few of the houses I saw had enough windows. Some were properly built, but most of them had windows that were too few in number and too high up, or too small, and many of them combined all these features. Some faced the north, which a poultry house should never do. Some faced the west, which, while not quite as bad, is still bad enough. Every henhouse should face the south or east, preferably the south, so that it may have the early morning sun to set the hens early to work and give them the comfort they enjoy while scratching for their breakfast.

The north and west sides of the poultry house should be tightly closed so that air in drafts can not blow through, and it is just as well if there are not even closed windows except on the south or east sides, or both, but there must be plenty of them there, and as many of them should be open even in the coldest days in winter, except during severe storms, as much as can be without drafts. If it is absolutely necessary to close all windows at any time to prevent drafts or to stop the snow from blowing in, close them with white muslin, which should be kept free from dust, so that the air may still circulate through them. Anyway, have a lot of air and no drafts. Then there must also be plenty of sunlight, and the windows must be so low down at the bottom that the sun can reach ever corner and keep the entire pen dry, that is, free from moisture. Moisture is fatal to health, moisture is bound to exist in tgihtly closed houses, collecting from the breath of the birds if in no other way, and to get eggs in any great number in winter, moisture must be kept oht.

Fresh air is the first important factor in health, but other things are necessary. The pens must be kept clean, cleaned often and thoroughly; the water in pans (and there must always be plenty of it) must at all times be clean and fresh; so must the food, and decayed meat and vegetables are especially dangerous to birds of any kind, and should never be thrown into a pen, much less allowed to remain there for the hens to devour. Cleanliness is next to Goliness with hens as well as humans.

The litter as well as the roost board must be kept clean, and should be changed often and kept deep as well clean. There can be no profit without labor, and this is as true in the poltry yard as anywhere else. The attendant must work himself to keep everything in proper order, and he must make the hens work as well. This is most easily accomplished by scattering the grain in deep litter so that they can not find it without scratching for it. If they are kept busy most of the day, the results will usually be quite satisfactory, other conditions being favorable. There are various feeding devices for the purpose of keeping the hens constantly at work, but the deep litter is far better than any of these devices. Bury the food in the litter and they will rig for it in the natural way, and they will get all they want of it an dsing while the are at work, if given half a chance.

The four chief elements necessary to success, then, are plenty of air, cleanliness, food and water, and work. This combination will spell success with any breed of poultry that ever grew, the birds having a reasonable amount of health and vitality to start with.

NEST BOXES FOR PRACTICAL HENS

Unless sections of nests are properly built it is better to use shallow packing boxes about one foot square. The boxes are removable, the litter is not easily scratched out of them and they are easily aired and sprayed on all sides. However, the best nests are built in sections that are removable and they are darkened. The birds enter on a track at the rear. This satisfies their instinct for hiding eggs and there will be less danger of the eggs being lost in the litter of the house or hidden in deep grass on the range.

Nests 12 by 14 inches are suitable for the larger breeds and dimensions 10 by 12 inches will do for Mediterraneans. If the nests are too large, more than one hen may crowd on at the same time and this may result in picking and fighting and broken eggs. If the nests are too small the birds will not use them but hide their eggs on the range or make nests for themselves in the poultry house under the dropping boards. When eggs are laid on the litter they may be lost by having straw scratched over them while the birds are working for scratch grain.

The location of the nests depend on the likes of the owner. Some nests are placed under the dropping board but we dislike this method as it complicates the work of keeping the roosts and boards free from mites and lice. If the windows are high it is possible to build a section of nests under them. However, if the sun strikes the top of these nests in the summer, they will be warm and the birds will not like them. It is probably best to make the nests in sections on the side wall where they will be protected from the hot sun.

The best litter we have used for the nest is twisted hay. It must be packed well in the corners and then a firm cushion placed in the middle so that it will not work out and permit the eggs to strike the bare boards and crack or break open. Eggs that are broken in nests cause poultrymen serious losses. They are not marketable even when slightly cracked and if they break it may lead to the egg eating habit which is difficult to locate and cure.

Plenty of clean litter in the nests keeps the eggs clean. Eggs keep the best in storage when they do not have to be washed as the washing removes the fine film which is nature's protection to the egg. When tobacco stems can be obtained they make fine nesting material as they keep away mites and lice. When the straw or hay litter is used it pays to first paint the nests with lice paint to seal the cracks and crevices and keep pests from breeding there and driving the hens to seek laying places elsewhere.

At certain seasons when the hens are laying heavily the usual number of nests may be insufficient. Then a few kegs or orange crates placed in the house will give the hens a little surplus room and often a large number of eggs will be laid in the extra nests. Usually about four or five hens to a nest is practical. A hundred hen poultry house should have 20 to 25 nests. Then, if that is not enough room in the spring, a few extras can be placed in the house until the heaviest part of the laying season is over.—R. F. K.

Royal Purple Stock and Poultry Specifics and Foods

In the manufacture of all our Stock and Poultry Condition Powders and Remedies we eliminate the cheap filler which is used by many manufacturers to make up a large package, and give you pure material which you can adulterate yourself if you wish. Mr. Farmer, how does this appeal to you?

Royal Purple Stock Specific

is a pure unadulterated condition powder, it is not a dope. It can be used throughout the entire feeding season and will not do your animals one iota of harm, works entirely on their digestive organs, causes them to assimulate the foods properly and digest every particle of food value. Fifty-five to sixty per cent. of food value is a fair average of what the animal takes out of its food without this condition powder: it makes their coats sleek and causes them to take on a healthy appearance in a very short time.

What We Claim For It

Cows will give from three to five pounds more milk per day during the winter months. You can fatten pigs a month earlier, have larger and better pigs and save a month's time and feed. You can fatten horses ready for sale in four to six weeks. If you don't believe us try a 60c package on the worst animal you have on your place and be convinced. How many times have you said to yourself, "No matter how much I feed my animals they do not seem to thrive." This, Mr. Farmer, is because your animals are not in a healthy thriving condition. Royal Purple Stock Specific will compel them to put on a thrifty appearance in a short time and yet it will cost you less than 15c. per month per animal to use it. Put up in 60c. packages, $1.75 and $6.00 tins. If you have a lot of stock buy the large tin. It contains sixteen 60c. packages.

PURE BRED STEER under 1 year, entered in Lot No. 3, Toronto Fat Stock Show, Union Stock Yards, Toronto, Ont., Dec. 11-12, 1919, and awarded 1st Prize. Also entered for Royal Purple Calf Meal Special, and awarded 1st Prize. Fed and Exhibited by Mr. Orll Williamson, R. R. No. 1, Jarvis, Ont. Sold for 33c. lb. by Auction. Weight, 1190 lbs.

Royal Purple Laying Meal

During the many years we have been making our high-class Stock and Poultry Specifics, we have had thousands of letters from Poultry raisers all over Canada, wanting to know what to feed their poultry. A hen is just like a factory. If you have lots of material in your factory, you can get out the finished product. The hen requires so much Protein, so much Fat, Ash Lime, etc., to make an egg and supply her bodily needs. Ordinary grains will give her a supply for herself and to make one egg every two to three days. For the accommodation of our customers, we have produced a Laying Meal which contains high-class meat meal, grains, etc., that will give her everything she requires for her bodily needs and produce an egg per day. If you cannot get this material from your dealer in your own town send us $5.00 for a hundred-pound bag and we will ship it to you direct. This product certainly fills a long felt requirement for the poultry man and simplifies the matter of feeding.

MANUFACTURED BY

W. A. Jenkins Mfg. Co., Limited

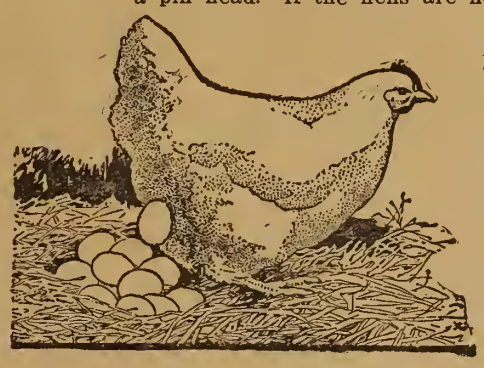
LONDON, ONTARIO

Royal Purple Meal Calf

There is probably no mixed feed on the Canadian market that the farmers have been buncoed more on than Calf Meal. You cannot make a substitute for milk with less than 10% Fat or over 20% Protein. Calves are entirely different from grown animals. You must supply them with material as much like milk as possible. In our Royal Purple Calf Meal we have a product on which you can raise calves after they are eight days old just as well as though you used new milk. At the Toronto Fat Stock Show this year there were eight calves shown not over a year old that averaged over one thousand pounds each, that were fed on this meal. If you will write us for our new booklet we will send you the full particulars and photographs of all these calves. Mr. Farmer, when you want calf meal you see that it contains over 10% Fat. Unscrupulous dealers and manufacturers are making meals that do not contain more than 7% fat and a large percentage of protein. Many of these meals are no better than ordinary dairy feeds. Fat costs two and a half to three times as much as protein in any market, but you must have it in calf meal to make a substitute for milk. Our Royal Purple Calf Meal is put up in 25, 50 and 100-lb. bags.

Royal Purple Poultry Specific

If your hens are not laying after the first of January it is because they are not housed properly and are in an unhealthy condition. There is no excuse for hens not laying if they are fed and housed properly. Our Royal Purple Poultry Specific, if used in the mash given them, will make them digest their food properly, make their digestive organs healthy and active and will produce the eggs for you as well in the winter as in the summer. The eggs are formed in batches from ten to fifteen, from the large egg down to the size of a pin head. If the hens are not healthy nature will lie dormant. As soon as our Poultry Specific is used nature becomes active. This is why so many people get eggs in a few days after using our Specific. If you do not get eggs it is your own fault. This Specific is put up in 30c and 60c packages, $1.75 and $6 tins.



Royal Purple Chick Food

made from all kiln dried white grains. You can raise 95 to 98% of your young chicks with this food, put up in packages and bags.

We also manufacture the following valuable brands:

Royal Purple Lice Killer in 30c and 60c. tins.
" " Cough Cure in 60c. tins.
" " Sweat Liminent in 60c bottles.
" " Disinfectant in 35c., 65c. and $1.40 tins.
" " Roup Cure in 30c. and 60c. tins.
" " Worm Powder in 30c. and 60c. tins.

Every article we make is guaranteed to do exactly as represented.

For Sale by reliable dealers everywhere. If you cannot get any of the above articles from your dealer write us direct.

FREE Write us and we will send you one of our new books that are now being published, giving you all the common diseases of stock and poultry, how to treat them, how to build a hen house, and wilderness of valuable information.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

"Whatever the weather may be," says he,
"Whatever the weather may be,
It's the songs ye sing, and the smiles ye wear
That's a-making the sun shine everywhere!"
—James Whitcomb Riley.

THE LITTLE TIN QUEEN

As Cordelia dealt the cards her glance swept the crowded parlor and dining room of Mrs. Gleason's home. Mrs. Gleason was the general storekeeper's wife. There were four tables of players, and they filled the small rooms to overflowing. The one upon which she laid the cards had very evident marks of usually doing duty as a wash stand. The pack of playing cards was old, bent and not overclean—the queen she just picked up had a queer washed look.

"And you were born and brought up in the city, Mrs. Parks?" asked little Miss Wren, the village dressmaker, arranging her hand neatly.

"Yes, of course," answered Cordelia Parks in a slightly patronizing voice. "This is my first experience in the country."

"I guess you do find it different in many ways?" queried Miss Wren with respectful timidness.

Mrs. Parks laughed rather loftily. "My dear Miss Wren, things are very, very different in the city. Just for an instance, the card parties I attended were very large affairs, often twenty or more tables, in private homes, of course. And each card table," with special emphasis, "was covered with linen and had an embroidered number on it. A new, brand new, pack of cards for each table. And the prizes!" The three women at her table leaned forward with admiring eyes, open-mouthed, drinking in each bragging word.

'Oh, Mrs. Parks!" chirped Mrs. Briggs, the doctor's wife, from the next table. "We just can't wait over here till you come to our table. Mandy wants to hear all about those city society affairs, those dinners in particular, where the men folks wear swallow tails and—"

"Full dress," corrected Cordelia, with a blase air. "Oh, dinner parties! Gracious, when I think of them, and a dance afterward or a theatre party! You can imagine," addressing Mrs. Piper, who had twelve children and had never ben farther than the next little town, "how I miss them!"

Over in the dining room at the end table the neice of the hostess asked in a whisper, "Who is she?" indicating the speaker in the next room. "She certainly wasn't here two years ago when I visited you, Aunt Sarah."

"Why, the mill was just being built, don't you remember, Em? Mrs. Parks is the manager's wife—from the city, a society lady. She's used to a thing or two, Emma Cobbs!"

"Golly!" exploded Emma in giant admiration. "Wish I'd get to her table."

"We made her president of our Ladies Aid, and we've started a woman's club. Of course, we couldn't have done it withouh Mrs. Parks. I tell you, we appreciate having somebody like that living here in Glenwood."

"And, Emma," whispered the doctor's third oldest daughter, "you should se her house! Wait till the club meets there; you'll open your eyes. It's grand!"

Cordelia walked slowly home—to the newest, biggest house in the village.

"Well, have a good time," asked the genial voice of Dale Parks as he stooped to kiss his little wife.

Mrs. Parks Frowned slightly—by this time he should know. "Dale, how can I? You know I never liked it here; you know it, too! I've been here two years, and I don't like it any better than the first day. These countrified affairs; How can you expect me, a city bred girl, to amuse myself?"

"But, dear, in time perhaps—"

"Dale, be reasonable and logical. Think how I've been brought up, what I've had in the city. I'm starving here for real people to talk to, for real pleasures. The theatres, the concerts, the parties! Oh, Dale, the parties—" And quivering lips could form no other words.

Dale gathered the silk bundle of sobs in his arms and comforted as only a husband can. "You're homesick, I believe. And you're going to the city for a visit! Yes, you are!" And closed the protesting lips with a resolute kiss.

A few days later Cordelia got out of the Pullman and went straight to Aunt Vivian's waiting limousine. Oh, the joy of riding through the city streets in a luxurious, perfumed car, with Aunt Vivian, so exquisitely dressed, at her side!

"Tonight Mrs. Wells gives a dinner dance, Cordelia, I've telephoned her about you, and it's all right for you to come along, dear."

"Who is Mrs. Wells?" I can't remember."

"Oh, I suppose she came in our set after you married. She's very smart and her affairs are always delightful. A bit exclusive, you know."

That evening Cordelia slipped into her lacy evening dress, one of her, trousseau. She had never worn it; how could she in Glenwood? Aunt Vivian viewed her critically.

"Am I all right?" Cordelia asked.

"Oh, it will do. But tomorrow I'll buy you a new dinner frock."

Cordelia looked down in dismay. What did Aunt Vivian mean? The idea disturbed her. She kept thinking of it the whole way to Wells'.

A half hour later she found herself in a gold and white drawing room with a crowd of people who with only one or two exceptions were entirely strange to her. As she compared dresses she realized that her gown was not of the most modern cut. It made her very uncomfortable.

The dinner was long. Her neighbor, a gentleman who seemed to have sme financial interest in a popular show, began to discuss it with her, but when she confessed she had not even seen it he unconsciously turned to his other partner. The other neighbor, outside of a few perfunctory remarks, focused his attention upon a lovely woman across the table, who seemed to be a sort of queen of the evening. At the first opportunity after dinner Cordelia asked her aunt who this very popular lady was.

"The senator's wife," with importance; "she used to live in Washington, you know. We've made her president of our Current Events Club and we all feel very honored to have her in our set. And, Cordelia, if you could get an invitation to her home! Oh, my dear, it's simply superb!"

"Do," answered Cordelia rather stupidly, not knowing whether to be awed or bored. After that she had the distinct feeling of falling in the background. She did dance a few times, but mechanically, without effervescent gayness. As she sat watching the dancers it was impossible not to remember the little Glenwood hops, where she had been the most sought after partner. How many dances she had split to please one of her husband's office people or not to offend an admiring clerk of Gleason's!"

Mrs. Wells asked herto join one of the bridge tables that had been arranged for the older people who did not dance, but Cordelia had not played for two years and feared to play with these veterans.

Three days later Aunt Vivian and Cordelia returned from a meeting of the exclusive Current Events Club. It had been held at the Senator's house, and truly wonderful had been the decorations, refreshments and beautiful dresses of the ladies.

"Did you enjoy it, dear?" asked Aunt Vivian after she had warbled a long song of praise for the senator's charming wife.

"Oh, yes,' answered her neice without enthusiasm. "I did not know many people, though," she added. It seemed rather queer to be talking; she had ben so quiet all afternoon.

Stepping rather wearily into her bedroom, she gave a little screech of delight. "Dale!" And after a smothering embrace he explained. "I've come on business, honey. Great news. Mr. Whitman left, and, naturally, his place is open here in the city. There is a board of directors' meeting tomorrow, and, honey, all I have to do is to apply for it. You know they'll give it to me. Aren't you delighted? Think of it, living in the city again, and my little girl having all those things she's missed these two years! Oh, I'm glad! Of course, dear, the salary is just the same, but it naturally won't go as far in the city as it does way out in Glenwood."

"Dale, please stop a minute! You love your mill, don't you? You don't like that office routine work."

"But, dear, what's that to having you satisfied and happy?"

"Dale," coming close, "I want to go back to Glenwood and be a little tin queen."

HOME LIFE

Dear Editor:

About the first of January, 1920, I was put in touch with the "Maritime Farmer" through the kindness of friends in Charlotte County, and also the United Farm Women of Ontario. I at once received a sample copy and following that sent in my subscription for the present year.

I am pleased to have coming to my home a real N. B. "farm paper" and will confess that I have a selfish motive in becoming its subscriber, for I want so much to learn more, and yet more, about the work that means so much to me.

About two weeks ago I decided to send just a short letter to your paper hoping almost "against hope" that it might find a place in some small corner, just so that a thought from an N. B. Farm woman might give evidence of deep interest in that line. I had already chosen my subject and had done a little work on it when I received the first paper under subscription, issued February 17th, which I eagerly opened and perused. The short story entitled, "Too Much Ella" appealed to me so strongly that I at once threw aside my other subject and I will give just a bit of my own experience along this very line.

I love this dear "Ella" whether she really exists or not, for she is a woman after my own heart.

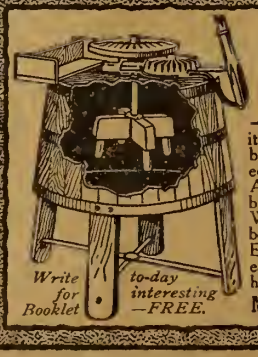
I was married very young and left the home of my early childhood. I spent about 20 years in town and country, after which fate led me to the dear old home to care for—to me—the very dearest parents in all the world. And the first thought entering my mind was: Now, you must give your mother just the sweetest rest she has ever known, for the lives of our forefathers were largely lives of struggle, and to the parents who raised a family of sturdy children, a life of unceasing toil, day in and day out.

After the excitement of becoming settled with us, mother, who was the weaker of the two, was so content that she simply slept most of the time for nearly a week. Just simply a let down from care: while I was each day making up my mind more and more to be just "To Much Ella." Mother must sit in her rocker with the dear little hand and pure mind simply at rest, while she watched her strong girl work. This went on for nearly a year, and slowly but surely I was actually killing my sweet mother with kindness. I saw a deep silence growing upon her, so very unnatural to her, and I was so utterly grieved I became most unhappy. But

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Mrs. M. Summers
BOX 309 WINDSOR, Ontario



Maxwell
"Home" Washer

—the washer that not only washes the clothes mechanically, but does it better than they can be washed by hand. There's no "skimping" by the "Home" Washer—light or heavy articles are cleaned with equal thoroughness. There's no tearing of delicate fabrics, either And it does the work in half the time! No more long-drawn-out, backbreaking washdays anywhere there's a Maxwell "Home" Washer; Just put the clothes in, and the rest is hardly work at all—because the "Home" Washer is so light, noiseless, and easy-running. Enclosed gears make it absolutely safe: "springs" make cover lift easily. Made of best quality cypress, handsomely finished. Runs by hand-power or water-motor. See it at your dealer's.

MAXWELLS LIMITED, Dept. X St Marys, Ont. 34

Kidneys Were Bad After The "Flu"

Sat Up to Turn In Bed.

That awful epidemic, the Spanish influenza, that swept Canada from one end to the other a short time ago, left in its wake a great many bad after effects. In some cases it was a weakened heart, in others shattered nerves, but in a great many cases weak kidneys have been left as a legacy.

Where the kidneys have been left weak as an after effect of the "Flu," Doan's Kidney Pills will prove to be just the remedy you require to strengthen them.

Mrs. Harvey D. Wile, Lake Pleasant, N.S., writes:—"Last winter I was taken sick with the "Flu," and when I did get better I found that my kidneys were very bad, and at night I had to sit up to turn around in bed. I used Doan's Kidney Pills, and found that they did me a wonderful amount of good. I also recommend them to my husband, and he started in to use them. I will always recommend them to anyone who is bothered with kidney trouble, for they are wonders."

Doan's Kidney Pills are 50c. a box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

See that our trade mark, a "Maple Leaf," appears on the box.

Rheumatism Stiffness and all Pain

Minard's Liniment has given satisfaction for three generations. It quickly relieves sore throat, bronchitis, neuralgia, sciatica and any kind of pain.

An Old Reliable Remedy

Mrs. S. Fawcett, Hamilton St., Collingwood, Ont., writes,—Minard's Liniment surely is an old reliable remedy. I always keep a bottle in the house and have recommended it to quite a number of my friends, to whom it gave great relief. In most cases it was used as a cure for rheumatism.

Minard's
King of Pain
Liniment
Yarmouth Nova Scotia.

Mr. W. T. Charlton of Waterville, P. Q. restored his frozen feet to health after doctors had advised him to have them amputated because mortification had set in. Use Egyptian Liniment also for Cuts, Burns, Scalds, Bruises, Chilblains, Sore Throat and Chest, Neuralgia, etc.

DOUGLAS & CO MANUFACTURERS, NAPANEE, ONT.

Advertise in the Farmer and Get Results.

just like the sudden bursting of a big black cloud to allow the sun to shine through, it come to me: Why, I do believe mother is kept too still!

I at once began to undo my former plan, for, after all, I needed her council. Gradually she grew more cheerful and happy. My own life easier to bear, for while I loved to see and know that she had "no care" yet I found that I actually needed her sweet companionship and co-operation in all my work—and why not? Was it not her guiding hand and mind, coupled with those of a faithful father that made the "old homestead" for her? And whose thought or action could guide me better than theirs? Truly it is a great and grievous mistake to believe for a minute that the dear hands that were ever found busy and the minds that were always active can suddenly become happy and contented in idlness. I would add jus a word to any who are still blest with the care of dear parents. Give them the sweet liberty that most assuredly belongs to them. Let them know that they are really needed. The home, whether on the farm or elsewhere, will then be a real home, and the inmates of it companions. The parents are a part of your daily necessities. Inded, I feel that just to have their decided approval is a strong and helpful brace in the structure of home life and I can safely say, adds years to their lives of usefulness and happiness as well as to our own.

Do not keep them in the parlor, thinking, "I am in the way." Let them live so close beside you that you feel their help each day. Then, and only then, shall we know we did our best when we've given our dear ones freedom. After that comes a long, sweet rest.

Trusting I may not have taken too much liberty and wishing the "Maritime Farmer" a bright and successful year, I am,

Sincerely,
FARMERETTE, N. B.

FOR OUR CONVALESCENTS

Severe colds, pneumonia, measles, etc., are so prevalent at the present time, the editress has selected from her cook book the following recipes especially suitable for the convalessent. She has tested them all, and, besides being nutritious, they make very attractive dishes.

Egg-Nog—Two-third cup of milk, one tablespoonful of sugar, two tablespoonfuls of wine or one tablespoonful of brandy, a few grains of salt; beat the egg slightly; ad the salt, sugar and wine. Mix thoroughly and strain; the wine may be omitted and a grating of nutmeg or other flavoring used.

Cocoa.—One and a half teaspoonful of cocoa, one teaspoonful sugar, one-third cup water, two-thirds cup milk, a few grains of salt; mix the cocoa, sugar salt and water. Boil five minutes or until it thickens; add the milk and heat to scalding point; beat untilu a thick froth forms; serve very hot. The cocoa should not be boiled after milk is put in.

Fruit Junket—1 pint milk, 1 tablespoonful sugar, ½ tablet dissolved in one-half tablespoonful of water, heat the milk until luke-warm; add the sugar and stir until it is dissolved; add the rennett; stir, pour into a glass dish; sprinkle with cinnamon or nutmeg. Let stand in a warm place until firm; chill; serve with cream or with cream and preserved fruit.

Another Fruit Junket.—3 almonds, 1/6 banana, 1 quarter cup milk, 1½ teaspoonfuls sugar, ¼ teaspoonful dissolved rennet; blanch the almonds and cut them in pieces; cut the banana in small pieces; place ina serving dish. Prepare remaining ingredients as for plain junket and pour over the fruit.

Egg Cream—2 eggs, ¼ sugar, 2 tablespoonfuls lemon juice, grated lemon rind; beat the yolks of eggs and sugar until well mixed; add the lemon juice and rind and cook over hot water as a soft custard. When thick, fold in the beaten whites; cool and serve.

Rice Jelly—Boil ¼ cup of rice in 1 pint boiling water, salted with ½ teaspoonful salt, for thirty minutes or until the rice is soft. Press through a strainner; turn into a mold and when cold serve with cream, sugar and a littie jelly, cinnamon or nutmeg.

Egg in a Nest—Break an egg and separate the yolk from the white. Beat the white until stiff; then add a few grains of salt; pile on a circular piece of toast first dipped in boiling salted water. Make a depression in the centre and drop in the yolk; place on a buttered pan and bake in a moderate oven until delicately brown. Serve at once.

STOP THAT PAIN

Why suffer—and in suffering neglect an ailment which may cost you your life? Pain is nature's method of warning you that the system is deranged—it is the signal for you to pause and take heed.

Backache, pains in the side, headache, rheumatism, lumbago, neuralgia, sciatica, etc., are due in almost every instance to Kidney trouble—to the uric acid and other impurities that are poisoning the blood through the failure of the Kidneys to act properly.

Gin Pills FOR THE KIDNEYS

WILL STOP THE PAIN

They have a wonderful action on the kidneys, soothing congestion, healing inflammation, rebuilding tissues, and enabling the delicate organs to resume their work of filtering the waste and poisons from the blood.

They contain no alcohol, just the beneficial properties of the Juniper Berry combined with seven other helpful diuretics and antiseptics.

Gin Pills are sold by all druggists and dealers at 50c a box,—with money back guarantee.

To prove their goodness we will send free on request a sample to enable you to judge their merits in relieving suffering humanity.

BEAUTY HINTS

Red Nose.—A slight catarrh, which is disagreable and makes one's nose red, can be cured by mixing a teaspoon of fine table salt in a glass of water; stir thoroughly, pour into the palm of the hand and snuff into the nose. Clear water will cause pain when snuffed into the nose, but salt in small quantities will not irritate the membrane. Another catarrh remedy is the follwoing:

Cattarh Snuff—Equal parts pulverized sugar and finely ground borax. Mix thoroughly, and keep in closed box. Use frequently as a snuff. This is very helpful in any bad cold.

Oily Skins—A little benzion dropped into the bath water is always good for an oily skin. This can be bought at any local drug store. Dashing the face with very cold water after washing is splendid also. The following may be used instead of the regular soap, for eliminating oily secretions:

Bathing the Face—Hot water, into which a little milk ha been poured, cannot be surpassed for bathing the face. It freshens and cleanses the skin and tends to lessen the wrinkles. Hot water is beneficial for the face, and should be used morning and night; espcially at night, before the cold cream massage. It opens the pores and remove a great deal of the natural oil, besides tightening the skin, thus keeping it firm and less liable to wrinkle. If hot milk and water, half and half, are used, soap will not be required. A flannel wash cloth is best, renewing it as often as it becomes thick and felt-like. Washing the face nightly in hot suds, made from pure castile soap, or with hot milk, followed by a firm upward (never up and down) friction, with a moderately coarse towel, is the recommended course for the black specks that ruin so many skins.

Liquid Toilet Soap—Four quarts rain water, 4 ounces of borax, 4 ouncesof baking soda, 2 ounces ammonia. Mix and bottle. Shake before using. Fine for sensitive oily skins.

BUILD UP YOUR BODILY RESISTANCE

1.—Sleep with at least on window open in your bedroom all the year round.

2.—Eat plenty of good, wholesome food.

3.—Never allow yourself to become more tired by staying up late after a hard day; make up for it by going to bed early.

If you are in good health, if your resisting power is good, the germs of disease are less likely to harm you.

Nothing helps to build up the resisting power so much as proper food, plenty of sleep and pure, fresh air.

COOKERY COLUMN

COCOA BISCUIT

2 cups flour
4 teaspoons baking powder
½ teaspoon salt
2 tablespoons sugar
4 tablespoons Cowan Cocoa
3 tablespoons butter
2/3 cup milk

1. Mix and sift dry ingredients.
2. Rub in the butter with the tips of the fingers.
3. Add milk gradually, mixing to a soft dough.
4. Toss on floured board.
5. Roll lightly to one-half inch in thickness, cut into small biscuits.
6. Bake in a hot oven 12 to 15 minutes.

WHAT IS A BOY'S PLACE IN THE HOME?

What is the boy's place in the home? What are his rights, his privileges? Is he to be deferred to? Or is he just simply a something— a nuisance, shall we say—that must be tolerated? The answer to all this may come this way: "It depends on the boy." Not altogether, I should say, for after all the boy is more or less what you make him, and the way he is started in the way he is most likely to follow.

How, then, shall he be directed from the beginning so as to establish satisfactory relations between the boy and his home. Of course, there are certain conditions to be taken into account; for instance, the temperament and tendencies of the parents, the circumstances into which the child is born, the other children (if any) of the home; all these have a certain part in deciding how the small boy shall be introduced into life.

We might call to mind some such instances as these: Take the boy for whose education, or college course, the pleasures of the famliy have been sacrificed, while he takes it quite as a matter of course—he had never been taught self-denial or self-control; the consequential child, whose judgment and opinions are made much of, until he becomes a more important man; the petted boy who has been waited on until his manners are hopelessly spoiled, and the idea of waiting upon mother, sister or wife would never occur to him. Such instances as these are unending, as we all know. Perhaps some may think this sounds a little hard on our boys, and will say, "Well, whose fault is it?" Let me temper this a little by saying that you will find that, in nine cases out of ten, it is a woman—mother, sister, aunt or perhaps grandma—who is at the bottom of the injury to the material from which a splendid, strong, self-forgetful man might have been made.

For centuries women were held inferior to men, and the birth of a son was always hailed with joy, while a daughter was regarded with sorrow even. Shat she should minister to her husband she takes as a matter of course. And it is but a step to transfer the ministry to her sons, and to fall into the habit of considering their comfort (which, of course, is right to a certain degree), sacrificing herself to their wishes in a way to ruin the best boy that ever lived. In former times, the boys of a family had to bear the yoke of obedience in their youth, but, with the new departure of child-training which has come in later, there has come a revolution in home methods, and the iad that children should be permitted to develop unhindered and to follow their individuality whither it led, has made life easier for them and harder for everyone conected with them.

But to come back to the subject under discussion. What is the boy's place in the home(his right and privileges? In the first place, he should be made to understand very clearly that he has a right in the home, a right to a place of his own in that home, which should be provided for him. He should have a room for himself to call his very own—not a sort of lumber room, back in some dark, out-of-the-way corner or in the attic, with the thought that any place is good enough for the boys. And, if there is any old piece of furniture, broken and past use—"Put it off in the boys' room, they won't mind." How little we know, sometimes, how much they do care.

Very little effort is made (as a rule) to make the boys' room attractive. "Oh! boys don't care for such things." Well, don't they! I wonder how many try to find out the boy's views on such matters? Any boy has some idea of tidinness and comfort, surely; and, if he has a neat, tidy room for himself, with a few of the right sort of pictures hung on the walls; clean, plain curtains for the windows and a place supplied for his books, curios, coins, birds' eggs, or whatever the boyish fancy might take to; plenty of good light to read by, I think you will find quite as much appreciation from your boys as from your girls. And, when a boy says: "Thank you, mother," with that queer little quivering look about the mouth, that only a mother can understand, surely we are more than repaid for the little extra attention given to his room.

This, then is part of what it means to give a boy a place of his own in the home. Am I counselling the very sort of spoiling I have just condemned? Let me say he is to have a place of his own in the home, but that it is not only his home, but the home of others as well, he should not be allowed to forget, and that he owes as much consideration to others in the home as they do to him. There often comes the question of how much noise the boy may be permitted to make in the home, and there seems to be no middle line to this. Either the boys are checked here and hushed there until they feel afraid to move, or else they are allowed to make all the racket they choose, on the plea that, if they cannot do pretty nearly as they like at home, they will be driven to some undesirable places or dissapation by their longing for freedom and liberty. Now, at the risk of being thought a little heartless, may I say I see no reason why boys should be privileged to make things hideous for those about them, on the plea that they must expand their lungs, etc. My conclusion is that, by calling upon the principle of compensation, a boy may be made happy in a home where he is obliged to restrain such impulses as stamping in heavy shoes on a hardwood floor, shouting and yelling playing ball in the house, and all such sports too numerous to mention. Some will say that it is as natural for a boy to do this as for a young colt to run in the field. Granted, but boys aer not colts, neither are they in the field (when in the house.)

Now for the principle of compensation, to which I referred. One of these compensations, to my mind, would be found in a room like the one we have already planned. Give him the freedom to bring his friends to it sometimes. Then, of course, we would advice a generous amount of self-control on the part of mother, as to the condition of the room after the boys have had their time in it. Also give the boy the privilege of having his friend in for a meal as often as you can conveniently do so. It does not mean so much to you, and much to the boy. Boys are not critical, bless their hearts. Give them a right cordial welcome, plenty to eat, and they are pleased. But, if we are to have the boy quiet in the home, we must provide means for him to give vent elsewhere, in places intended for relaxation and recreation. We cannot confine him to just a pleasant room, remember. And, when he displays the consideration demanded of him at home, he is putting a restraint upon himself we can hardly understand neither does he. But what he does understand is love and consideration. Give him plenty of both. The many little pleasures we plan for our children often mean more to them than we ever thought of. An afternoon out-of-doors with your boy, showing an interest in what he is interested in, all has its weight, you know.

He should also be drilled in the gentle are of waiting upon women. Not that I would place a woman upon a pedestal! The tribute to her from a boy is exacted more for his sake than for hers. Now, in saying this, I would not minify the sacrifice made by mother for children. Without admitting homage is due a woman for the mere fact of motherhood, I do not wish to deny sacrifices of will, health and happines to which mothers submit cheerfully for the sake of helping their children. And so the love and duty of her sons and daughters, the tenderness which anticipates her efforts and saves her steps and work are no more than her due. Yet there is more even than the rendering of a debt in training the boy to wait on his mother. The lad who practises gentleness is bound to feel it. He learns to understand weaknes, to pity it and, in a way, to honor it. And all this has its effect in deepening and developing the character of the man. In fact, his education is not complete if he has not been more or less drilled in the little attentions whose familiar use marks the gentleman.

CARE NEW GERANIUMS

Geraniums which were started from cuttings early in autumn, say in Setember or October, should be kept growing in the sand or soil in which tehy were started until they have made good roots.

They should not stand closer than

THE HABIT OF DAINTINESS

THE habit of daintiness may be cultivated early in any child. While it should never be allowed to develop into an unwholesome vanity and love of dress, it is an asset that makes for success and happiness in later life.

"Prue Cottons" have the advantage of combining daintiness with cheapness—softness of texture with strength and long wearing capacity. For the "recitation dress" there is a wide range of plain white cottons, fine or coarse, twill or plain, heavy or light. Or you may select quaint print designs, and for sturdier service, "Steel-Clad Galatea" or "Rockfast Drill."

The house-mark of the Dominion Textile Company, Limited, covers all these lines. It is the symbol of the prudent house-wife's approval and the pride of the manufacturers in their goods.

NONE BETTER

an inch apart. Further apart is much better, as it gives them an opportunity to shape up into a good plant from the start.

After several new leaves have started, they should be examined and if they have rooted nicely, they should be potted in good rich soil in two and a half or three-inch pots. Keep them growing until summer, when they are to be transplanted to their permanent beds.

To lift the new plants without injury to the delicate roots, something like a broad-bladed knife should be run under the plant and the sand or soil loosened from the roots so they will not be broken as in case of simply pulling the new plants from the starting soil.

Give these roots plenty of room when potting the plants. This will help to prevent the very young geraniums from starting to flower until they are old enough to have strength to put forth flowers.

The potted geranium does not bloom well until it is somewhat root-bound, and that is why they should not have too much room. If a plant blooms quite freely when it is quite young, it is not apt to do well later.

Build up Your Strength with

OLIVEINE EMULSION

One reason why OLIVEINE EMULSION is so helpful for Coughs, Colds, Weakness and a General Run-down Condition is, because it contains the substances that re-build flesh, enrich the blood, improve digestion and appetite, and give vigor and vitality to the entire system.

If you are not feeling well, see what OLIVEINE EMULSION can do for you—take no substitutes.

All Druggists and General Stores have it.

SOME VEGETARIAN SUGGESTIONS

One hardly opens a paper nowadays without finding an article on how to cook the cheaper cuts of meat. For years household science teachers have proclaimed the cheaper cuts as nntritious as the more expensive ones and could be as delicious if properly prepared, but to this the general public has turned a deaf ear. But now at last, when its purse is being touched a trifle too roughly, that same public has begun to listen. And this time it is the clever newspaper people who have caught its ear. They are not merely persuading readers that cheap cuts are tolerable, they are making them fashionable. Economy is no longer a neglected virtue, it is the fad of the moment.

Probably most people eat too much meat, certainly meat once a day is enough for anyone unless he is engaged in hard physical labor. Meat cannot be banished from the dietary, but its place can sometimes be taken by a vegetable food which is equally nutritious, less expensive and better for the system. I suspect that in many homes meat appears at supper as well as at dinner, and I should like to suggest certain dishes wihch could well take its place at the evening meal.

Meat is valuable as one of our chief sources of protein. There are, however, certain vegetables which contain protein in fairly large quantities. These are legumes—beans, peas and lentils being the commonest varieties of this class. These vegetables are all inexpensive, yet it is signifivant that they are little used. People pay a big price for canned peas and beans, which in their green state contain very little nutriment, yet they do not use the dried vegetables which are rich in food value and very cheap. I suspect that this is because they do not know what delicious things can be made with the legumes.

First let us consider beans. I am told that very few dried beans are sold in the shops. We grow them every year and save them for cooking, but I doubt if this generally done. Just try it next year and see how well you will be repaid. What seems curious is that people seem to like baked beans so well, although they seldom prepare them. I find that at a sale of food one can dispose of almost any amount of baked beans. People buy them as if they were an unaccustomed luxury, whereas they are easily made and cost little.

They are highly nutritious and satisfying, and people might well adopt the Boston custom of having baked beans for supper every Saturday. Here is a recipe. Try it and see if you don't like them.

Boston Baked Beans

Cover beans with plenty of cold water to which has been added one teaspoonful of baking soda. Let soak over night.

Drain off the water, cover the beans with fresh water and cook until, when a bean is taken between the thumb and first finger, the skin cracks readily.

Put the beans in an earthenware bean pot—a small crock will do if the bean pot is not available. Put pieices of salt pork with the beans—one-half pound would be sufficient for a pot of beans. Add one tablespoon salt, one tablespoon molasses, three tablespoons brown sugar and one-half tablespoon mustard (all level measurements). Fill up with water, if the liquor in which the beans were boiled is not sufficient to cover them.

Bake all day in a slow oven. An hour before serving remove the lid from the pot and add one cupful of catsup to the beans. Leave uncovered so that they may brown.

Boston baked beans are incomplete without Boston brown bread, which should be served hot with the beans. As a matter of fact, it makes an excellent fancy bread for any meal, particularly if one cupful of stoned raisins be added. It is easily made and inexpensive.

Boston Brown Bread

One cup rye meal.
One cup granulated corn meal.
One cup graham flour.
Three-quarters teaspoonful soda.
One teaspoonful salt.
One-half cup molasses.
Two and one-quarter cups sour milk.

Mix dry ingredients, add molasses and milk, stir till well mixed, turn into a buttered mould and steam three and a half hours.

Baking powder cans may be used as moulds. They should not be more than two-thirds full. The lids should be fitted down closely.

After the bread is cooked, turn it out, cool it, then cut in slices and eat with butter.

A supper of beans and brown bread is a delightful variation from the accustomed menu. But this is only one way in which beans may be used. Bean soup is very good and very nutritious. It may be the main supper dish, and few people will disdain a bowl of this steaming rich soup.

Black Bean Soup

1 pint black beans.
2 quarts cold water.
2 stalks celery.
1 small onion.
1 tablespoon salt.
⅛ teaspoon pepper.
1 teaspoonful mustard.
3 tablespoonfuls butter.
Cayenne.
2 tablespoons flour.

Soak beans over night, in the morning drain and add cold water. Slice onion and cook five minutes with half the butter, adding to beans, with celery stalks broken in places. Simmer three or four hours, or until beans are soft; adding more water as the water boils away.

Rub through a sieve, reheat, add salt, pepper, mustard and cayenne well mixed. Bind with remaining butter and flour cooked together.

Cut two hard boiled eggs in thin slices, and thin a lemon in thin slices, removing seeds. Put in tureen and strain the soup over them.

Split Pea Soup

1 cup dried split peas.
2½ quarts cold water.
1 pint milk.
½ onion.
¼ pound bacon cut in cubes.
3 tablespoons butter.
2 tablespoons flour.
1½ teaspoon salt.
⅛ teaspoon pepper.

Pick peas over, soak them over night, drain, add cold water, pork and onion. Simmer three or four hours; when soft rub through a sieve.

Add butter and flour cooked together, also salt and pepper. Dilute with milk, heat to boiling point and serve.

Lentil Soup

Soak lentils, cook till soft, press through a sieve.

Cook an equal kuantity of tomatoes with a bay leaf, a peppercorn and a clove. Press through sieve also.

Combine the lentil and tomato pulp adding one tablespoonful flour and one tablespoon butter, which have been cooked together. Season, reheat and serve.

Dal Soup

This is made exactly the same way as the lentil soup. Dal and lentils are not commonly sold—but grocers can probably get them. They are inexpensive and make delicious soups.

While we are talking about soups here is a vegetable soup without stock which is worth trying:

1/3 cup carrot.
1/3 cup turnip.
½ cup celery.
½ onion.
1 quart water.
5 tablespoons butter.
½ tablespoon finely chopped parsley.

Head Ached So Bad

HAD TO GO TO BED.

When the liver becomes sluggish and inactive it does not manufacture enough bile to thoroughly act on the bowels and carry off the waste matter from the system, hence the bowels become clogged up, the bile gets into the blood, constipation sets in and is followed by sick and bilious headaches, water brash, heartburn, floating specks before the eyes, and painful internal, bleeding or protruding piles.

Milburn's Laxa-Liver Pills regulate the flow of bile so that it acts properly on the bowels, and stirs the sluggish liver into activity.

Mrs. E. Bainbridge, Amherst, N.B., writes:—"I take pleasure in writing you of the good I received by using Milburn's Laxa-Liver Pills for headache. I was so bad I had to go to bed, and could not sit up. A friend told me about your wonderful medicine, and two vials have made me as well as I can be."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price, by The T. Milburn Co., Limited, Toronto, Ont.

Salt and pepper.

Clean and scrape or pare the vegetables, then cut in fine cubes—the onion must be sliced thinly. Melt the butter, add all vegetables except potatoes and cook ten minutes in the butter, stirring constantly. Ad pototoes, sover and cook two minutes. Add water and boil one hour. Add parsley, season and serve.

Scalloped Celery

A reader of this page writes of the uses of celery which, besides being a delicious vegetable, has distinct medicinal value. She calls to mind the fact that all parts of the stalk are good; the leaves, for instance, may be dried in a slow oven, and then used as a seasoning for soups, creamed potatoes, etc.

Here is a recipe for the tougher parts of the celery which one may not care to serve raw. It sounds very good—and I thank Samantha very heartily for sending it.

Cut celery into half inch pieces, wash in several waters, cook in boiling salted water till tender. Drain, saving the water in which the celery was cooked.

Put the celery in a baking dish, arranging a layer of celery, then a layer of dried bread crumbs, and over this a layer o grated cheese. Make a cream sauce with:

2 tablespoons butter.
2 tablespoons flour.
½ cup milk.
1 teaspoon salt.

Pour the sauce over the celery, cover the top with bread crumbs. Bake in moderate oven till well browned.

Onions may be boiled till tender, then placed in a baking dish and covered with a cream sauce. (Make the sauce of milk alone.) Sprinkle the top with bread crumbs, put bits of butter here and there. Bake in a moderate oven till brown.

These are only a few of the many ways in which vegetables may be premay be prepared.

SPRING FASHHIONS

Plaids of all sorts, worn so much all winter, will be worn throughout the spring in certain colorings and textures. In plain colors the new very light gray promises to be a favorite ,replacing somewhat the beige materials which have been so much worn for several seasons. This new gray is a truly exquisite shade but, alas, very trying to the complexion, so that nat all of us can wear it successfully.

Besides, there is a new gray-green which has suddenly come into favor, a gray-blue which in bure or Kasha makes a smart tailleur, and a new shade which may be described as a sort of ivory gray and which is usually combined with black. Gray tinges many of the new spring fabrics, whatever their color— a sort of smokiness pervading everything.

Tailored jackets for spring will be sorter and generaly rather loose, although a few models show the close line to the top of the hips with a slight flare below. The redingote in light-weight materials will still be worn over thin frocks, which it is designed to conceal completely. The silhouette in general continues slender, and skirts, while no shorter, are not appreciably longer, although it is rumored that many longer skirts will be found in the spring collections—ankle-length evening frocks with skirts which are lifted in front in some fashion or slit or averlapped on the sides. However, the chances are decidedly in favor of the rather short evening skirt with trained panels which ordinarily sweep the floor for at least ten inches of their length, but which may be tucked up in dancing—and again the chances are that these panels, once tucked up, will remain so. We all adore short skirts.

The waist-line has a falling tendency—many of the latest models being frankly girdled about the top of the hips. And this line, it should be noted, is very pretty. However, with the hip girdle the skirt below falls straight. Panier effects are still worn but the latest models show a much reduced pnier, and in many the panier has given away altogether to the scanty crosswise drapery—the shallow folds drawn tightly about the figure to the hips.

INEDIBLE FATS MAY BE MADE INTO SOAPS

In these days it is decidedly unpatriotic as wel las extravagant to waste one bit of fat. All housekeepers know that the price of soap is advancing rapidly and steadily. It is a very simple thing, indeed, to make your kitchen soap, yourself. But, do not use fat that might be needed for cooking purposes. Mutton tallow or fats that have been scorched and are of no further use for cooking may be made into soap in the following way. For each pound fat use one-seventh pound (1-7 lb.) of caustic potash (lye) dissolved in 1¾ cups cold water. Heat the fat to the melting point, then add the lye and water mixture; beat with an egg beater until an emulsion is formed. Or, if you have a large quantity, turn in an ice-cream freezer. Unless you mix it thoroughly it will separate in layers. Pour into a pan and mark in squares.

If the fat is very dark or has a strong odor, it will be improved if it is clarified. To do this, heat the fat with water, stirring constantly. Allow to boil one-half hour, then put aside to cool. Remove the hardened cold fat from the water and scrape any waste matter from the bottom.—Magdalene Hahn.

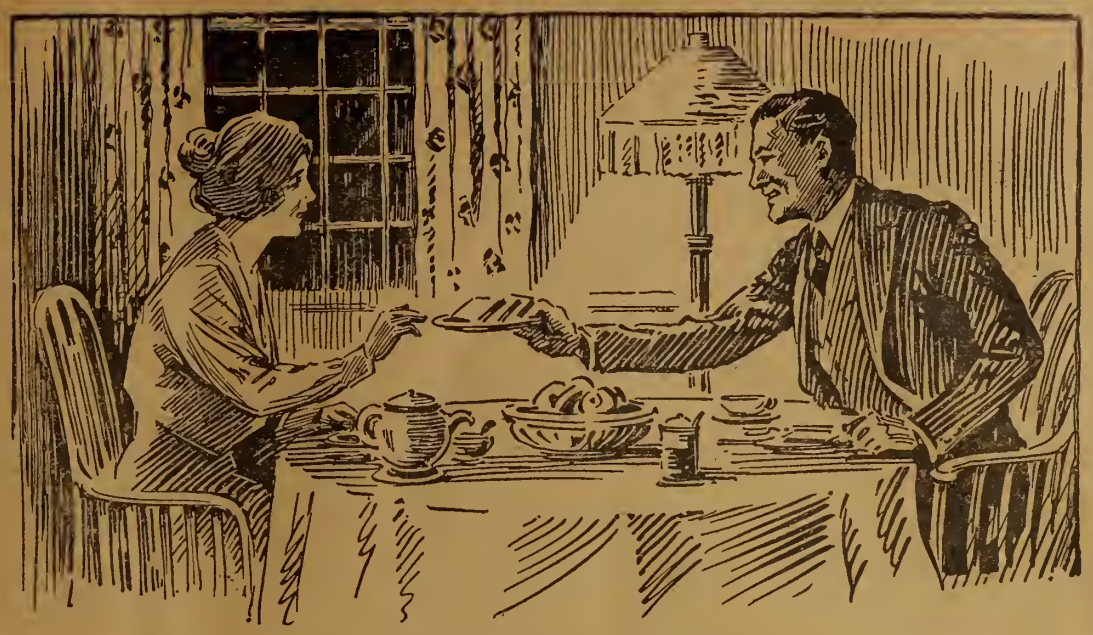
POWDERS

Powders and creams are the most generally used "beauty helps"—consequently there are hundreds of differerent kinds of preparation on the market. The woman who wants to choose the best from among them is often puzzled as to which sort she needs.

That's one of the advantages of making simple beauty cosmetics at home—you know they are pure, and you can get so much more for the same amount of money. It's rather a dainty task, too, if the woman has the time to take for it.

If you are ever in doubt about a powder, test it with ammonia. If it contains sugar or lead, which is harmful to the skin, it will turn black. Powders containing mineral substances are mostly harmful; those made from vegetable products are quite all right. Rice powder, which is exceedingly fine, is about the best to use on the face; talcum powder (having a tendency to cling to the skin, and being cooling), is best for use on the shoulders and arms, but is not very good for the sensitive skin of the face.

Plain, unscented rice powder may bought, put in a jar, and scented with extract or a perfumed oil. Take, for instance, half a pound of rice flour; half a pound of rice starch; two ounces of powdered boric acid—an antiseptic—perfume with 15 drops of essence of citron and 30 drops esennce of Bergamot. Or a similar amount of any essence you prefer, the scent being optional. This is very fragrant and refreshing.



But He Was Wrong

"Say! This is great bread. Did your Mother send it over, Mary?"

No! Indeed, she did not! Baked it myself this morning."

"It's exactly like your Mother's. You'd better cut another plateful, dear. Some bread!"

"Thank you, Jimmie. It *is* good, isn't it? It's the flour that makes this bread so good. It is perfectly wonderful!"

"Why, what *is* this wonder flour?"

"Mother's old favorite—

Extra strong in gluten—the invisible part of the wheat berry that does such a lot in producing good bread, and milled from the best hard wheat in the cleanest modern mills. Cream of the West Flour will make the finest flavored, bulgiest loaves imaginable.

REPORT OF THE NOVA SCOTIA SUPT. OF DAIRYING

(Continued from page 415)

In conclusion I wish to thank you for the assistance and encouragement you have given me in my work. I also wish to thank the people of Baddeck District for the many kindnesses shown me since my coming to Baddeck.

Respectfully submitted,
(Sgd.) G. W. Parker.

INSTRUCTOR'S REPORT

(Read by R. B. McLellan at the N. S. Dairymen's Association)

Gentlemen:—

I have the honor to submit my second annual report as Instructor and Inspector of Creameries for Nova Scotia.

The early part of January was taken up with work in connection with the Dairy Exhibit at the Annual Nova Scotia Dairymen's Convention, which was held at the Agricultural College, Jan 9th and 10th. This exhibit was made up of one fourteen pound box of the regular make of butter, each month, from June to October inclusive, from each of the sixteen Creameries competing. Kept in cold storage until Convention time, and then socred by three independent judges and the average of the scores taken. This with the fresh made butter made up the exhibit and showed a decided improvement in uniformity of quality and workmanship over previous years, although there is still considerable room for improvement.

January and February were largely taken up with instruction work with regular students, in the Dairy.

Two weeks in February and March were spent visiting the Dairy Schools at Guelph and Kingston and also a few of the larger Creameries in Ontario and Detroit, Michigan.

It was my privilege to act as instructor in buttermaking during the short course for buttermakers at the Maritime Dairy School at Truro in March. The attendance was fair and the interest and attention given by the students throughout the course made the work pleasant for me and I hope profitable for them.

This feature of the Creamery work in the Maritime Provinces is an important one and will do a great deal towards standardizing the methods of manufacture and the quality of the Creamery butter in these provinces.

I attended several meetings in Cumberland County, held in connection with the establishing of a creamery at Amherst by Biden's Limited, giving those resent an outline of the Creamery methods. also pointing out some of the advantages of a Creamery to the farmer, and a short talk on separating milk and care of crem.

The summer months were lrgely taken up with visiting the Creameries in the province, each Creamery being visited at least three times and some of the smaller Creameries oftener. inspecting and giving the Manager and Buttermaker any instruction or assitsance possible. I found the Creameries in very fair sanitary condition, some of them showing considerable improvement over last season. Considerable attention was given to the stopping of loss and waste in Creamery practice.

Several of the Creameries have installed new pasteurizers, churns and other equipment and more will be installed next season.

Five of the Creameries have been experimenting with motor trucks for gathering cream, with generally satisfactory results. The fact was brought out quite clearly, that to get satisfactory and economical service, it is absolutely necessary to have a careful driver. who will see that his car is in good condition after each trip and make any repairs or adjustments which may be necessary. With conditions such as I have outlined a truck will run a season with comparatively little expense, out side of gas and oil, while with a careless driver the repairs will run into larger figures even to fifty per cent. of the original cost of the car.

I checked up the books of two of the Co-Operative Creameries during the summer months. This was done to inspire confidence on the part of the Patrons and to insure that the Creamery business was carefully and accurately conducted.

I checked up and made the preliminary score on the monthly shipments of butter to the North Atlantic Fisheries Cold Storage for the "Summer Butter Competition."

The month of October was largely spent in scoring the Dairy products at the Fall Fairs. The number of exhibits grows smaller each year, espeiolly in those districts served by any of the Creameries in the province. This is another indication of the tendency of the dairy farmer to ship his cream to the creamery rather than make the butter at home, as in most cases the work is considerably less and the returns more satisfactory.

The quality of the Creamery Butter in this province is showing a gradual improvement in uniformity of type and quality. One of our largest butter exporters said a few weeks ago, that "The average quality of butter received by them this season was considerably better than any previous year, but there was still considerable room for improvement."

The showing made by the Nova Scotia Creameries at the Canadian National Exhibition, where one First and three other prizes were won, and at the Dominion Educational Scoring at Montreal, where a Nova Scotia Creamery won First place for workmanship, should be very encouraging to Creamery men and Dairymen generally.

I wish to thank Mr. H. R. Brown, Superintendent of Cow Testing for Nova Scotia, and Mr. G. B. Pippy, Inspector of Dairy Products for the Maritime Provinces, for their advice and assitsance in certain phases of my work.

I wish to thank you, Mr. MacKay, for your advice and assistance in the various problems which come up in my work as Inspector.

Yours sincerely,
(Sgd.) R. B. McLennan.

AYRSHIRES IN R. O. P. TEST

During the months of January and February the reports of .71 Ayrshire cows that qualified in the R. O. P. test were received in the Secretary's office. These were made up of 14 mature cows, 7 four year olds; 13 three year olds; and 30, two year olds. In the Mature class, "Selwood Pride", 34853, owned by J. L. Stansell, Staffordville, Ont., heads the list, with 12, 591 lbs. milk, 530 lbs. butter fat, in 361 days, her average per cent of butter fat during the test was 4.21. The next highest was "Princess of Tanglewyld 3rd", 41737, owned by Wooddisse Bros., Moorefield, Ont., 11,652 lbs. milk, 457 lbs. fat in 365 days. Her average was

SUN LIFE ESTABLISHED NEW LANDMARKS *in* 1919

New milestones in the progress of the SUN LIFE ASSURANCE COMPANY OF CANADA were passed in 1919.

Applications received.....over $100,000,000.00
Assets.....over $100,000,000.00
Assurances in force.....over $400,000,000.00

Gratifying progress was made in all other departments during the year.

SYNOPSIS OF RESULTS FOR 1919:

Assets as at 31st December, 1919	$105,711,468.27
Increase over 1918	8,091,089.42
Cash Income from Premiums, Interest, Rents, etc., in 1919	25,704,201.10
Increase over 1918	4,053,101.41
Profits Paid or Allotted to Policyholders in 1919	1,606,503.37
Total Surplus 31st December, 1919, over all liabilities and capital (According to the Company's Standard, viz., for assurances, the O^{M}. (5) Table, with 3½ and 3 per cent interest, and for annuities, the B. O. Select Annuity Tables with 3½ per cent interest.)	8,037,440.25
Death Claims, Matured Endowments, Profits, etc., during 1919	12,364,651.15
Payments to Policyholders since organization	91,227,532.30
Assurances issued and paid for in cash during 1919	86,548,849.44
Increase over 1918	34,957,457.40
Life Assurances in force 31st December, 1919	416,358,462.05
Increase over 1918	75,548,805.92
Life Assurances applied for during 1919	100,336,848.37
Increase over 1918	42,529,881.70

THE COMPANY'S GROWTH

YEAR	INCOME	ASSETS	LIFE ASSURANCES IN FORCE
1872	$ 48,210.93	$ 96,461.95	$1,064,350.00
1884	278,379.65	836,897.24	6,844,404.64
1894	1,373,596.60	4,616,419.63	31,528,569.74
1904	4,561,936.19	17,851,760.92	85,327,662.85
1914	15,052,275.24	64,187,656.38	218,299,835.00
1919	25,704,201.10	105,711,468.27	416,358,462.05

The SUN LIFE issues more ordinary assurances annually than any other Company of the British Empire.

The Burrowes Manufacturing Co.,
611 King St. West, TORONTO

3.92 per cent fat. Following her was "Springhill Prairie Flower", 29407, owned by Shuttleworth Bros., Maidstone, Ont., with 10,677 lbs. milk, 433 lbs. fat, in 365 days and had an average of 4.15 per cent fat. The fourth highest was "Polly 6th, of Fernbrook", 48000, owned by Collier Bros., Beachville, Ont., with 10,175 lbs. milk, 400 lbs. fat, in 365 days. Her average was 3.93 per cent fat.

The highest in the four year old class was "Briery of Springbank 3rd," 44093, owned by A. S. Turner, Ryckman's corner, Ont., with 12,608 lbs. milk, and 519 lbs. fat produced in 365 days with an average fat content of 4.11 per cent. Next came "Duchess of Briar Crest", 50109, owned by the Experimental Farms, Ottawa, Ont., with 11,735 lbs. milk and 507 lbs. fat to her credit produced in 352 days with an average of 4.32 per cent. Following her was "Floss of Springbank", 44097, owned by A. S. Turner & Son, Ryckman's Corner, Ont., she produced 11,529 lbs. milk and 434 lbs. fat in 332 days, with an average of 3.76 per cent fat. Next highest was "Springburn Lucky Girl", 45814, owned by Gilbert McMillan, Huntingdon, Que., with 10,530 lbs. milk and 422 lbs. fat in 321 days and an average of 4.01 per cent fat.

The highest producer in the year old class was "Acmelea Grace", 57225, owned by H. C. Hamill, Markham, Ont., with 9772 lbs. milk and 396 lbs. fat in 328 days and an average of 4.09 per cent fat, the netx highest was "Fannie of Glencairn", 61528, owned by Thomas J. McCormick, Rockton, Ont., with 8872 lbs. milk and 359 lbs. fat in 363 days and an average of 4.04 per cent fat. Following was "Tanglewyld Primrose 3rd", 48993, owned by Wooddisse Bros., Moorefield, Ont., with 8466 lbs. milk and 326 lbs fat in 352 days. Her average per cent was 3.85. The next highest was Tangle wyld Pansy", 48991, owned by E. J. Cragg, Alma, Ont., with 8459 lbs. milk and 345 lbs. fat in 364 days with an average of 4.07 per cent fat.

The highest cow in the 2 year old class was "South Craig Lady Maud 2nd", 59836, owned by Wm. A. Gibson, Glenelm, Que., with 11,007 lbs. milk, and 498 lbs. fat, in 365 days with an average of 4.52 per cent fat. The next highest was "Tanglewyld Princess 4th", 53082, owned by Wooddisse Bros., Moorefield, Ont., with 10,733 lbs. milk and 452 lbs. fat in 365 days with an average of 4.22 per cent fat. The next highest was "Springbank Lady Jane", 51318, owned by A. S. Turner & Son, Ryckman's Corner, Ont., with 10,560 lbs. milk and 428 lbs. fat, in 365 days with an average of 4.05 per cent. The fourth highest was "Gardrum Floss", 50306, owned by Nova Scotia Agricultural College, Truro, N. S., with 10,382 lbs. milk and 433 lbs. fat in 357 days with an average of 4.17 per cent.

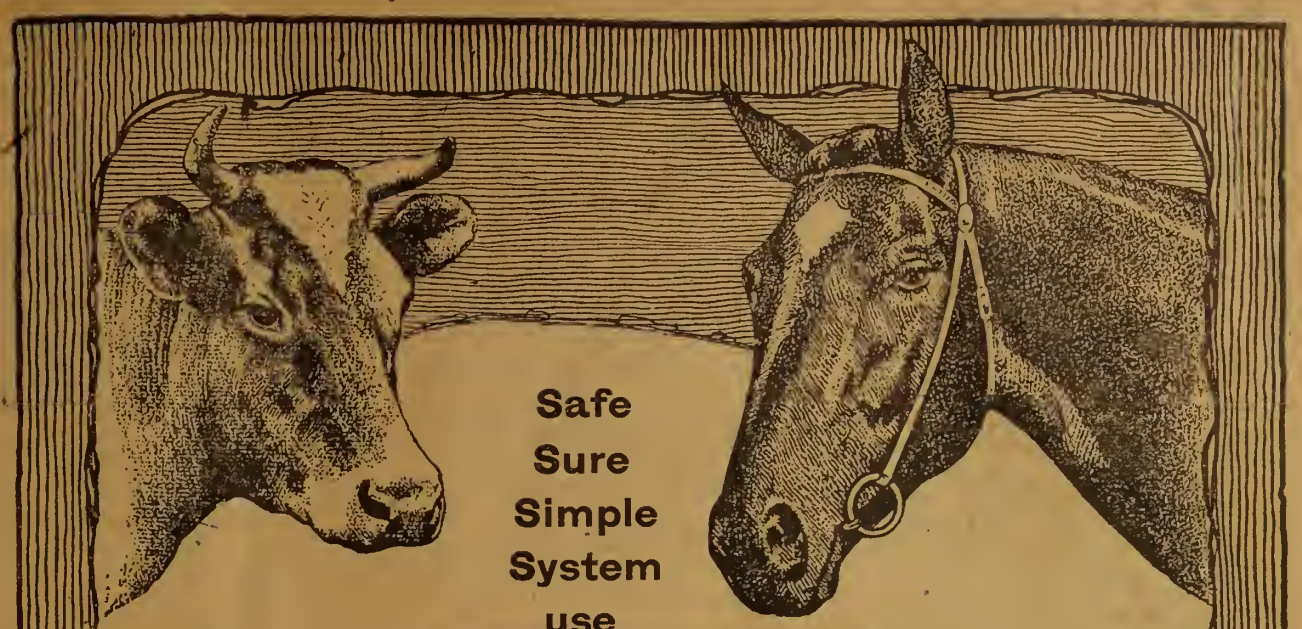
The exceptionally good records made by many of the two year olds was especially noticeable. Besides these mentioned quite a number gave over 9,000 lbs. of over 4 per cent milk.

W. F. STEPHEN,
Secretary.

COW GOING DRY

A. J. D.—Will you please tell me why my cow is going dry. There are yet two months before she is due to calf. Last year I stopped milking her while giving one pint daily, three weeks before she freshened. Now she is reasonably fat, in fact, more so than last year, and she only gives a half pint of milk at a milking.

Ans.—The food your cow eats has three functions to perform, viz.:—Maintain the cows body and nourish the calf she is carrying and produce milk. The first call on the food consumed will be for the maintenance of body and development of the uterus. If the food supply is not sufficient to leave a balance after these needs are supplied, the milk production must suffer. We would suggest that you feed your cow well and see that she is regularly watered. The winter of 1920 is much colder than the winter of 1919. It is just possible therefore, that your cow is not as comfortable in point of warmth as she should be. A two months rest with abundance of food will put your cow in good shape fir her next lactation period.



THE FINEST THE WORLD PRODUCES

STAMINAX CALF MEAL
(with separated milk only
Cheapest and finest calf meal in the world. You feed 1/3 to 1/2 less than ordinary calf meal and get better results.
Protein 17, Fat 14, Fibre 5
Price $9.10 per cwt.

STAMINAX DAIRY MEAL
Protein 20, Fat 5, Fibre 10
Price $5.95 per cwt.

STAMINAX MILK GROWING MASH
Protein 16, Fat 4, Fibre 7

STAMINAX MILK FATTENING MASH
Protein 16, Fat 5, Fibre 5.5

VALLEYTOWN CALF MEAL
Made from Flax, Oilcake Meal, Oatmeal, Corn, Sugar, Powdered Milk, Flour, Peas.
Protein 16, Fat 5, Fibre 5.
Price $6.25 per cwt.

STAMINAX MILK LAYING MASH
Protein 18, Fat 3, Fibre 7.5
Price $5.40 per cwt.

STAMINAX CHICK FEED
Best feed to give young chicks from 2 days to 6 weeks old. Made from Canary Seed, Flax, Groats, Millet, Kaffir Corn, Wheat, Corn.
Protein 11, Fat 3, Fibre 2.5
Price $7.70 per cwt.

VALLEYTOWN SCRATCH FEED
Made from Corn, Wheat, Kaffir Corn, Buckwheat, Oats.
Protein 10, Fat 2.5, Fibre 7.
Price $5.15 per cwt.

VALLEYTOWN LAYING MEAL
Made from Milk, Peas, Alfalfa, Shorts, Corn, Flour, Beef Scrap, Mustard.
Protein 15, Fat 3, Fibre 7
Price $5.05 per cwt.

All Staminax Feeds are delivered in new sealed bags. No oat hulls, dust, screenings, sweepings, charcoal, grit, oyster shell or cheap fillers are used. Staminax and Valleytown Feeds are guaranteed to contain nothing but the choicest re-cleaned grains.
Terms, 2% discount, cash with order. Freight paid on five bag lots to your nearest railway station in New Brunswick, Nova Scotia or P. E. I. 100-pound lots delivered by freight or express, our option, 50c per cwt. extra.

STAMINAX MILK HOG FEED

The ideal feed for hogs of all ages, as it raises hogs from Birth to finished Pork in the least possible time, with the least possible labor and expense. Place the feed dry in trough, give them all they will eat and watch them grow. After the hogs have eaten the feed give them all the water they can drink. Can be used with absolute safety from Birth to finished Pork.
Protein 17, Fat 3, Fibre 5
Price $5.40 per cwt.

SOME NOTES ON SOILING CROPS

Even among the more conservative of our farmers soiling crops are gradually coming into favor. When the hot, dry weather of July and August parches the pasture fields and the grass loses much of its succulency and food value, the dairy cows are sure to fail in milk if some provision is not made to supplement the pastures.

A vast amount of data and experience in growing soiling crops has been collected by the different experment stations in Canada and the United States. Corn, where it does well, is by far the best crop for the purpose, but corn will not succeed in every district. And in some districts where it will do fairly well there are other crops that will do better if measured by the amount of labor required to grow a ton of feed.

The cost of labor is the chief argument against soiling crops, especially where these are cut and fed in the stable or yard. But many soiling crops may be pastured with the best results. This will very greatly reduce the labor needed.

Among the crops that do well for soiling are rape, O.P.V., (oats, peas and vetches), millet, oats and peas, etc. Rape may be sown either in drills or broadcast any time from spring until the last of July. When sown in drills cultivation greatly increases the yield. It gives the best results when pastured off by sheep or hogs. When fed to dairy cattle it will taint the milk. As a hog feed an acre of rape fed to young hogs equals two thousand five hundred pounds of meal.

In districts where corn does not do very well, a mixture of oats, peas and vetches is used for silage. It does equally well when pastured off.

Millet makes a good soiling crop but does not give as heavy a yield of fodder. It is often sown where another crop has been frost killed or failed to germinate. It makes a good crop of hay.

Oats and peas sown at the rate of two bushels of oats and one bushel of peas to the acre. This gives a very heavy yield of fodder. It is a fact that oats and peas sown together will produce more feed than if either are sown alone. This is an excellent soiling crop to feed to dairy cows. It will produce a large amount of good feed. The peas stand up well and are not easily damaged from tramping. The cattle may be turned onto it when the crop is ten or twelve inches high, but it is probable that more feed will be produced if the crop is allowed to attain a greater growth.

If not eaten down too closely this will continue to grow all summer. Any that is not needed for pasture will make an excellent quality of feed if cut when the oats are in the milk stage. It is harder to dry thon ordinary hay but when well cured it makes a first class feed for either dairy cattle or growing stock and requires less of the concentrated stock to form a balanced ration.

If milk cows are allowed to drop back in milk production during the dry weather it is almost impossible to bring up to standard later on. This is where a soilage crop will prove beneficial for it will prevent a decrease in the milk flow during a dry period.—John H. McDonald, Cape Breton Co., N. S.

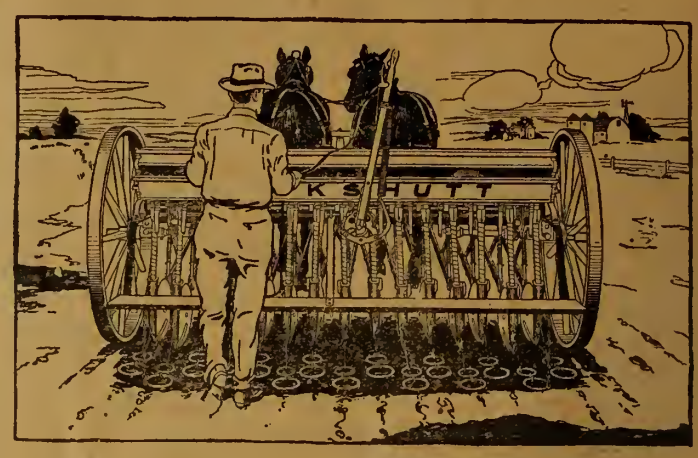
PLOWING SPEEDS

The old saying that "it is hard to get out of the rut" seems to still hold true today in regard to plowing. There is much diversity of opinion as to the proper speed to plow, but the chief argument for slow plowing seems to be that "grandfather did it."

Regardless of what you attempt, it is a slow and difficult proposition to swing people from habits they have cultivated for years. That is just what is occurring now in regard to plowing. Slowly the progressive farmers are coming out strongly in favor of faster plowing. This is emphasized by the great demand for the fast, lighter tractor.

First, let us consider what a good job of plowing is. One of the chief objects of plowing is to pulverize the soil. The plow may invert the furrow slice in a perfect manner, and completely bury all vegetation or trash, but it fails to pulverize, and leaves the soil in such a condition that the harrow cannot complete the work in the best and cheapest manner—it is not satisfactory. A good job of plowing occurs when the soil is thrown over in a well pulverized, and leveled condition, so that it can be planted

COCKSHUTT



The Cockshutt Drill —Perfect Seeding

Of all farming operations, seeding is the one in which guess work and haphazard methods must be eliminated. You have so much land to work. You want to use a minimum of expensive seed grain and you have only a limited time in which to work. All these factors have been carefully considered in the designing of the famous Cockshutt light draft Grain Drill.

It has a strong, non-sagging steel frame. Its positive force feed sows any quantity desired. The discs rise independently when striking obstructions. A convenient lever varies the depth of the seeding. The grain shoes deposit the seed accurately and the following rings cover it evenly and thoroughly.

When you buy a drill, get the best. Nothing else is worth while. Get a Cockshutt. It is no experiment but a proven, popular success. See one at our nearest Dealer's or write our nearest Branch for illustrated Drill Folder and catalogue of our full line of Farm Implements and Machines.

Eureka Potato Planter

Pays for Itself in Labor and Time Saved

One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.

Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. **Furrow opens and seed drops in plain sight**—an equal distance apart, at uniform depth, with **absolutely no injury to seed.** Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.

Write for **free** catalog on this great line of potato planters—the largest line made. Sizes for 1 or 2 rows, with or without fertilizer attachment. **In Stock Near You.** A success for over 20 years. Whether you are a large or small grower—write today.

EUREKA MOWER CO. Box 745 UTICA, N. Y.

Send for Catalog

with the minimum amount of labor, and preparation.

What occurrs when you plow slowly, that is with the speed of 2 to 2½ miles per hour? The soil is turned over slowly and does not tend to pulverize to any extent but to maintain the same shape as when cut from the land. Hence the furrow slices are laid against each other and the plowed field takes on a ridged appearance. Think of the great amount of soil surface that is exposed to the drying action of the elements. This plowing does not reduce to a minimum the preparation of the soil before seeding. It is no different than the plowing done by horses; the ridged condition makes it necessary to bring the field back to its levelled state. Also trash and weeds can be be seen poking their heads up between the furrow slices, ready to grow again. The jointer fails to woll the weeds in the corner of the furrow where they belong. Large clods are noticeable which, if not broken up soon after plowing, become dry and hard. Air pockets are numerous where the furrow sliecs are laid upon each other and due to the large clods aer difficult to eliminate.

Plowing at a speed of 3 to 3½ miles per hour is referred to as fast plowing. The soil is shoved up rapidlly and tends to go up high on the turn of the mouldboard and then is thrown over well pulverized and in a level condition.

With soil in this shape it can be prepared for planting with very little preparation. The field is level and has a granulated covering of soil over it to prevent escape of moisture, so that in case the soil was not worked for some time after plowing, the harm done would be greatly minimized.

The trash is well covered, very seldom will one see weeds or vegetation showing where the soil has been turned rapidly, and is level. Where the trash is buried in one corner of the furrow much better connection is made with the subsoil by the remainder of the furrow slice.

Scouring is often greatly facilitated by increasing the speed. As every farmer knows there are often sent spots in a field which have a tendency to clog up the plows, and to start the plow scouring, it is necessary to speed up a team after getting out of one of these soft spots.

The furrow wall will also appear more elan cut, and neater than the slower job.

Farmers agree that one of the greatest arguments for the tractor is its ability to get crops in quickly. Here is where fast plowing saves time for the farmer and fulfills his expectation of reducing the labor on crops.—C. H. Sprague.

ORCHARD CULTIVATION WITH THE TRACTOR

Thousands of farmers and fruit growers are trying to decide the tractor question. They know that in the tractor twentieth century progress is offering to agriculture the greatest mechanical help of a generation. It is sometimes hard for a farmer to decide, however, what type or what make of a tractor is best suited to his individual needs.

Fruit growers especially, in deciding their tractor problems, will be interested in the experience of Minch Brothers, who are successful raisers of South Jersey fruit and produce on their thousand acre farm at Brighton, N. J. L. W. Minch, secretary and treasurer of Minch Brothers, tells an interesting story of their experience with three Cletracs, the tank-type tractors.

"We bought our first tractor," said Mr. Minch to a representative of the Courier, "with the idea of giving it a fair trial, planning to buy other machines of same make if it made good. The fact that we have since bought two more Cletracs shows that the first experiment was a success. We found that one man with a tractor equipment can often do as much and better work than two men and eight horses

"When we bought our first machine we had a reasonable competent workman who after some instructions from the ocmanpy's salesman began at once to plow an orchard. It was a success from the start. The management of both tractor and plows was entrusted to this driver who soon became quite expert in their manipulation. He could plow to any desred depth, manoeuver around under the trees, and drive under the low spreading branches without difficulty.

"We found that in orchard tillage we could use the tractor with various implements attached to much better advantage than we had been using our horses. With such heavy foilage and low-top trees as are usual in modern orchards it is extremely difficult to work draft horses without danger of over-exhausting them. This is especially true in the heat of midsummer. The tractor, however, made all seasons its own and we found that drought and hard ground were no longer an excuse for suspending work. In fact, the frequent tillage kept the soil mellow and conserved the moisture."

FERTILIZERS FOR THE POTATO CROP

Of all ordinary farm crops that of the potato is probably the most profitably responsive to liberal feeding. The aceptance of this statement does not in the least ignore the fact that there are several other factors that play a very important part toward success in potato growing—type of soil, character of season and the cultivation and spraying of the crop—but it means that with these factors favorable the crop s a very responsive one to applcations of plant food and the yield will be approximately commensurate with the available plant food supply.

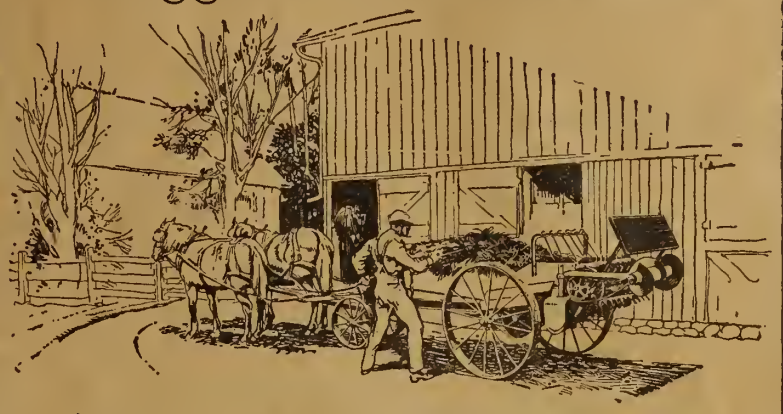
It is generally conceded that there is no better preparation for the crop than a clover or alfalfa sod well manured (10 to 20 tons per acre) and ploughed in the late summer or early autumn. This practice of fall ploughing ensures the decay of the sod and manure and provides a good supply of humus, which is so useful in keeping the soil moist, and at the same time allows for the preparation of plant food in forms available for the use of the crop. Spring dressings of manure are not desirable, as they tend to encourage the development of scab.

As is well recognized, soils differ greatly as to their productiveness—a quality largely dependent upon richness in available plant food—indeed there are no two soils exactly alike in this respect—and this fact makes it impossible to lay down hard and fast directions for fertilizing or to give a formula that would be equally applicable for all soils. But with a fairly good soil, from a well manured clover sod as described, we should consider 350 to 700 pounds of 3-9-6 commercial fertilizer would represent the limits that may be deemed desirable and profitable. This would mean an application of nitrogen 10½ to 21 pounds, of phosphoric acid 31½ to 63 pounds and of potash 21 to 42 pounds, per acre. If the ingredients are purchased rather than the ready mixed fertilizers (generally the more economical plan) the amounts would be notrate of soda 75 to 150 pounds, superphosphate 20 to 400 pounds and sulphate of potash 40 to 80 pounds, per acre. On light and very poor soilc scantily manured the maximum amounts here given may be somewhat raised, dressings to 1000 pounds or more per acre frequently proving profitable. For soils rich in nitrogen, as from clover and liberal manuring, the nitrogen in the above recommendations may be cut down one third. On clay loams the potash may likewise be reduced one-third.

It is considered good practice by many experienced potato growers to supply a part of the nitrogen in the form of an organic nitrogenous fertilizer, as dried blood. As both fertilizers contain approximately the same percentage of nitrogen this may readily be done by replacing half the nitrate of soda in the above recommendations by an equal weight of dried blood.

Probably the best plan of application is to broadcast the fertilizer mixture on the prepared land when reworked in the spring and harrow in. If the method of putting the fertilizer in the drill or furrows is considered more direct and more economical, care should be taken that the fertilizer does not come into direct contact with the sets.—Frank T. Shutt, Dominion Chemist, Experimental Farm, Ottawa, Ont.

Rugged and Efficient



THE first essential of a heavy-duty machine, such as a manure spreader, is rugged, substantial construction, so that the machine will withstand the severe strain that it undergoes when working on a rough field.

MADE IN CANADA

Warping or twisting of the frame will throw the mechanism out of alignment and cause some of the parts to jam or work hard. This does not happen with **Deering or McCormick Spreaders,** because the main frame is of channel steel, well braced by cross beams and tie braces.

The apron is moved from both sides at the same time, so that there is no danger of the chain jumping off the sprocket or of the apron twisting or binding, as sometimes happens where only a single chain is used. The beater is all steel and is placed so as to combine lightness of draft with the greatest possible operating advantage. It pulverizes the manure thoroughly. The wide-spread spiral screw gives the manure a second beating and spreads it uniformly, well beyond the wheels of the spreader.

Deering and McCormick Spreaders are rugged and efficient. They are built for long service and dependability. If that is the kind of a spreader you want, let us send you a catalog containing complete descriptive information. Write to the nearest branch house listed below. And call on your local International agent when in town.

N. B. INDUSTRY OFFERS STOCK

That the campaign to buy "Made in Canada Goods" is having its effect in every line of business is well brought out in this issue by the offering of Clark Brothers preferred stock, a parctical demonstration that the financial interests of the Country realize that not only should people buy Canadian made materials, but that the capital to provide and maintain the development of the industries should also be provided by Canadians. St. Stephen is well known for its several successful factories, all of them having a nation-wide reputation. Clark Brothers is one of them.

The making of boots and shoes in Canada is an interesting and far-reaching industry, touching and affecting a very large per cent. of the Canadian people. Shoe Manufacturers are planning to take immediate action to place before the public, facts and figures regarding the Canadian Shoe Industry. An interesting fact in this line was brought out in conversation the other day with Mr. John F. Clark, the head of this concern, when he pointed out that he is able to buy British grown and tanned leather at from twenty-eight to thirty cents a foot cheaper than the American manufacturers can obtain the same thing. This means so far as Canadians are concerned, the best grade of boots at the minimum of cost. It takes from thre to four feet of leather to produce on pair of ladies shoes. The saving in cost of materials at once becomes apparent.

Clark Brothers, Limited, are manufacturing and shipping between seven hundred and eight hundred pairs of ladies shoes every day, and these shoes are displayed in every city and town in every corner of the Dominion of Canada from Charlottetown to Victoria. They number among their customers such well known concerns as:

Robert Simpson Company.
Goodwin Limited.
Waterbury & Rising, Limited.
Hudson Bay Company.

And others too numerous to mention, as their accounts run into the hundreds, and every shoe manufacturer has the same story to tell, namely, that Clark Brothers shoes are the best they get. In fact the only difficulty is that they cannot get enough of them.

It is to remedy this difficulty that J. M. Robinson & Sons are selling the 8% preferred stock of the Company on terms that will give the investors 8% yearly on their money, paying it in four quarterly instalments.

Backing up successful Canadian industry with good Canadian money should be not only the habit but the principle on which Canadians from now on should do their investing.

This concern which in the seven years of its history with small capital has developed a most successful business and has built up a surplus of over $50,000, is ripe for the expansion which capital will now make possible. The business opportunity spread out before the Company runs hand in hand with the opportunity of the investors to put their money where it will give a handsome return nand do more good for Canada.

The Farmer Says—
"Show me the Cows"
World's Champions are milked with the Hinman
SOME of the world's finest pedigreed cows are milked with the Hinman daily.
Eleven years on the market—tried, tested and proven. More are in use than any other.
Hinman Milkers are better for the cows than hand-milking, because they are more uniform, more restful.
Milk is cleaner because it does not come in contact with outside air, human hands, dirt or other contamination. Hinman Milkers save much time and money.
Get the full story in our illustrated book on milking. Write to-night!

RE CANADIAN-GROWN SEEDS

During the past ten years the commercial production of field root and garden vegetable seeds in Canada has increased almost 100 fold. Our November 1919 seed survey indicates a production of approximately 150,000 pounds of seed, all grown under government control and exclusive of some 60,000 pounds of field root seeds produced on the Experimental Farms of the Federal Department of Agriculture. These seed supplies include most o fthe standard varieties that are favorably known to the Canadian public and the trade, and are now available through the usual trade channels.

There are several distinct reasons why our farmers and gardeners might prefer Canadian-grown seed, produced under government control;

I. The seed has been grown under cultural regulations calculated to protect the users of the seed, viz.: The parent stocks, whether seeds, bulbs or roots, are subject to the approval of the Seed Branch, Department of Agriculture. This insures their outstanding merit as breeding stocks. From these parent stocks are produced the commercial seed fields, which are inspected while growing so as to insure proper rogueing of off-type and other undesirable plants, roots or bulbs. Then, following the harvest, threshing and cleaning, the seed is tested to conform with specified standards of germination before it may go on the market with the approval of the Federal Department of Agriculture. This procedure insures practical protection to the purchaser when he asks for seed grown under government control.

II. The matter of acclimatization appears as an important factor. Seed that is matured in Canada is likely to be better adapted to crop production in Canada than seed of foreign origin. Numerous comparative tests by practical farmers and on Government Experimental Farms, clearly indicate that average home-grown root seed insures stronger vitality and generally produces larger crops of roots, than average foreign seeds.

III. It would appear to be of outstanding advantage to the Canadian farmer that he may reasonably demand when, where and how the seed has been grown. He may also expect to obtain seeds of certain strains of Canadian growth year after year, such as have proved of special value on his farm.

IV. It is false economy from a national standpoint to import millions of dollars worth of these seeds, when our country is well adapted to their production and is capable of developing sufficient supplies to equal Canadian requirements, as well as to cater to an export trade and compete favourably with foreign seeds from an economic viewpoint.

V. For further information regarding Canadian-grown field root and garden vegetable seeds, produced under government control, you are invited to communicate with this office.—Chief Officer, Markets Intelligence Division, Seed Branch, Ottawa.

Best-by-Test FERTILIZERS for every CROP and every SOIL

FARMS YIELD MORE IN CROPS AND MONEY when they are kept up to a high production standard by the regular use of good Fertilizers. BEST-BY-TEST FERTILIZERS are strong in fertilizing power and are up to full strength of analysis. If you want advice as to the kind of Fertilizer you need, write us about your crop and soil. We are headquarters for scientific users of Fertilizer in Eastern Canada. We pride ourselves on having every brand, make or chemical any farmer or dealer could ask for. Ask your dealer, or form a club of farmers and order in carload lots. Prices on request.

NEW OFFERING

With much pleasure we offer to the people of the Maritime Provinces a good opportunity to invest their money at home in a successful manufacturing industry.

PURPOSE

The purpose of this issue is to provide additional working capital to take care of the rapidly growing business and to take advantage of the goodwill and reputation built up by the management through seven years of successful operation.

We Offer **$100,000**

CLARK BROS. LIMITED

of St. Stephen, N. B.

8 p. c. Preferred Stock

Dividends payable quarterly Feb. May, Augt. & Nov.
Price 100 and accrued dividend, Yielding 8 p. c

BUSINESS

Clarke Bros. manufacture high grade MacKay stitched ladies shoes of such well known brands as "Supreme Lady", "Winnie Walker" etc.

Shoes of a quality as good as can be made by that particular process and retailing at a price within the reach of 75 p. c. of the women of the country, a fact which at all times assures a wide and ready market.

QUANTITY

The output of the factory is at present 700 pairs a day---the capacity is 2000 pairs a day---and this quantity will be the aim of the management as further capital makes the increase possible.

It will be a pleasure to send you our special circular with full particulars. Wire or Write for it.

J. M. ROBINSON & SONS,

Established 1889

ST. JOHN, N. B. - - - FREDERICTON, N. B.

HOW DOES CANADIAN GROWN ROOT SEED COMPARE WITH IMPORTED?

It is commonly conceded that, for some reason or other, European seed of field roots is superior, in respect to root crop producing ability, to seed raised in Canada. In order to investigate this assertion, which, were it true, naturally would prevent Canada from becoming a root seed growing company of importance, several experiments have been undertaken during the last few years.

In 1916, seed of a few varieties of mangels and Swede turnips raised the previous year by the oDminion Experimental Farms' System was tested in comparison with seed of the same varieties obtained commercially. The results of the experiments strongly indicated that the Canadian-grown seed was fully capable of competing with the comercial seed, which later had been imported from Europe, in respect to crop producing power. In fact in some instances the Canadian-grown seed proved decidedly superior.

In 1919, a very large number of varieties of field roots were tested. The majority were grown from ordinary seed of commerce, and the balance from seed produced at the Experimental Farms in 1918.

Although complete reports, at the time of writing, have not been received, a ew remarks on the camparative value in general of the Canadian-grown and the imported seed may be offered, particularly as the results obtained clearly demonstrate on what the crop producing value of root seed largely depends.

Most of the crops from the commercial, i. e., imported seed, proved rather unsatisfactory in as much as the roots were greatly lacking in uniformity and smoothness. In a large number of cases the so-called varieties were composed of all kinds of types, in fact often to such a degree that type which is a certain variety was supposed to represent could hardly be recognized.

The crops from the Canadian-grown seed were on the whole better. Outstandingly good were the crops grown from seed which had been raised by the Dominion Experimental Farm from roots representing improved varieties, i. e., varieties which for a few years have been subjected to a rigorous selection. In other words, the importance of selection was unmistakeably demonstrated. Applying the results to practical root seed growing, it follows, then, that, in order to gain a reputation as a reliable seed producer, the grower must base his seed growing business on very careful selection. Growing of seed from ordinary root crops without careful selction will never lead to profitable results. On the contrary, it will result in the placing on the market of varieties apt to prove inferior. Seed growing without careful and intelligent selection of the seed roots must therefore by all means be discouraged. On the other hand, it is a comparatively easy matter for any one who takes the trouble to select only the very best roots, uniform in shape and color, to develop a variety superior to the ordinary commercial variety from which the selection is being made. Seed produced from such roots will prove very much superior from a crop producing standpoint.—M. O. Malte, Dominion Agrostologist.

TUBER DISEASES OF POTATOES

When digging potatoes, a number of diseases may be observed on the tubers: For example, spots of corky tissue on the skin, called Common Scab; or black surface spots which look like pieces of soil, but remain sticking to the tuber when it is washed, this is the so-called Black Scurf or Rhizoctonia. Again, there may be brown spots somewhat silvery, especially when moistened—the Silver Scurf disease. These diseases do not affect the edible qualities of the potatoes; only when they are badly infected is a loss incurred, due to a deterioration in the saleable value.

Later, however after the potatoes have been in storage for some months more or less rotting of the tubers takes place, which in bad cases may result in 30% or 40% of the tubers becoming valueless. This rotting may be observed externally through its causing irregular sunken areas to appear, which are brown under the surface of the skin. This rot is due to Late Blight; this being a disease which first makes its appearance on the leaves as dead, water-soaked areas, occasionally killing the whole plant as well as infecting the tubers. Thus it is most important to spray your plants regularly during the growing season, particularly in warm and damp weather. Again, one may also find a dry rot with white pustules breaking through the surface; in this case the cause is a Fusarium Dry Rot, which is nearly always associated with a crack or bruise of the tuber.

Other diseases may be noticed when the potatoes are cut or peeled; for instance, a black discoloration extending from the skin inwards which is sometimes wet rotted. This is Black Leg, a disease which also attacks the growing plant, causing an unthrifty condition which often results in the plant turning yellow, falling over and dying. It cannot be controlled by spraying, but is easily held in check by planting sound potatoes, for the disease is transmitted to the plant by the tuber.

To control these diseases it is necessary to adopt a careful routine for the selection and treatment of the seed tuber at planting time, and to provide the best possible conditions of storage. These two points are briefly outlined as follows:

Seed Treatment

1.—Do not use seed from a field known to have been badly attacked by some disease.

2.—Discard all cut, broken or bruised tubers.

3.—Before cutting, soak them in either: (a) Corrosive sublimate solution—2 ounces in 25 gallons of water—for four hours. N. B.—**Corrosive sublimate is a deadly poison.**

(b)—Formalin solution—1 pint in 30 gallons of water—for two hours.

4.—When cutting tubers, keep a jar of formalin at hand with a spare knife in it, and when a tuber is cut which shows any discoloration, discard it, drop the knife into the jar, and use the other one for the next tuber.

5.—Do not plant potatoes in a wet, undrained soil, for such soil furnishes conditions favorable to many diseases.

Storage Conditions

1.—See that the potatoes are thoroughly ripened, and exercise the greatest care to avoid any injury to the tuber.

2.—Keep the temperature of the store room about 36 degrees F. Potatoes freeze at 26-28 degrees, F., and freezing must be avoided.

3.—There should be ample ventilation with sufficient moisture to prevent the potato drying, but not enough to cause water to condense on the surface of the tubers.

4.—Direct sunlight should be excluded.

It is of the utmost importance to spray regularly during the growing season, since, more particularly in the case of Late Blight, mentioned above, there is a direct relationship between the diseased plant and the later rotting of the potato in storage. In this article, however, we have aimed at emphasizing (1) the planting of healthy tubers, disinfected so as to kill externally adhering diseases and (2) the providing of conditions in storage which will reduce the losses from rotting to a minimum.

BANKING CO-OPERATION

FARMERS will find it to their advantage to co-operate with this Bank.

With branches throughout every province of Canada, and correspondents in all parts of the world, we have unequalled facilities for gathering news of markets, prices, and business conditions of interest to farmers.

DOCK THE LAMBS

In the ten years from 1901 to 1911 the number of sheep in Nova Scotia decreased from 285,204 to 221,074. A duction of 64,170 or twenty-two and one-half per cent, With the decrease in numbers the interest in the flocks particularly on the average farm, waned accordingly.

Since the last census interest in sheep raising old fashioned, slip shod caring for the flock is increasing. The war and the need of more stock coupled with the high prices that prevail has done and is doing wonders for the industry.

There is no need to dwell on the necessity of a flock on every farm. No province in the Dominion is better adapted to sheep raising than Nova Scotia. Despite the impetus given to sheep raising old ashioned , slip shod methods are still the rule on many farms.

Docking and castration are two operations that should not be neglected. Go into almost any district in Nova Scotia or New Brunswick and one will see flocks in which not a single member has been docked.

An undocked flock of sheep is evidence of carlessness on the part of the owner. It is not a dangerous operation nor one that requires much time or labor. It adds to the appearance of the animal, enhancing the blockiness in shape. The tail is really of no value and in summer when pastures are green and soft it becomes covered with filth that detracts considerably from the animal's appearance.

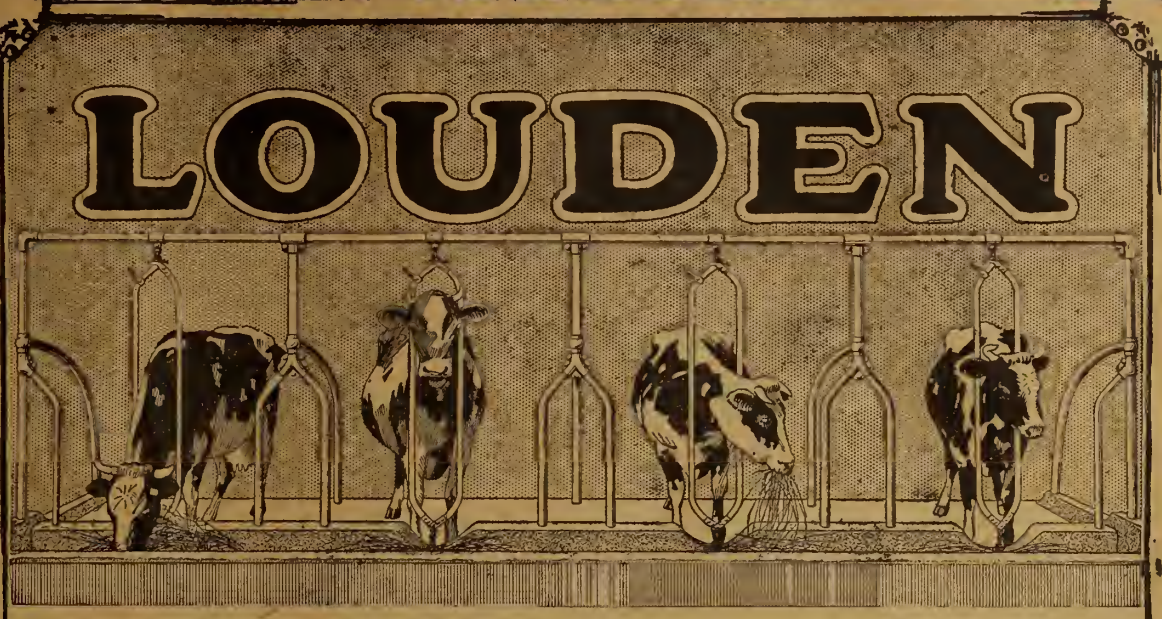
No farmer can find a reasonable excuse for not docking his lambs. There are many different methods and al are simple. Last year I had the good fortune to observe the methods employed on a mixed farm in Suffolk on the east coast of England, not far from Ipswich.

The lambs were from five to ten days old when the operation was performed. The operator placed the lamb between his feet and grasped the tail with fingers of the left hand he worked the skin of the tail towards the body. With a knife in the right hand a quick cut was made from beneath the tail upwards, severing it at the second joint from the body. This left a very short stump and the skin when released came down and covered the end of the stump. The lambs when released immediately ran to their mothers and commenced to feed. No ill effects from shock could be observed. Sometimes a few drops of antiseptic was put on the cut.

Another method is to use an inch and a half or two-inch chisel and placing the tail on a block, cut it off with a sharp blow. Another method prefered by some is to use a red hot pair of pincers. This sears the wound and prevents bleeding.

Any and all of these methods have been found satisfactory. The small amount of time necessary to perform the operation is more than repaid by the improved apearance of the flock which often means increased prices if sold alive.

No farmer can afford to neglect this operation if he wishes his flock to equal in appearance that of his neighbors.—J.H. McDonald.



Swinging Stanchions and Stalls

BESIDES being the strongest cow tie made, the Louden Stanchion is also the most comfortable.

Holding the Stanchion to the curb is a single slack chain, with a tensile strength of no less than 5,000 lbs.

This slack chain allows the cow to swing the Louden Stanchion freely in a circle eight to ten inches wide. Think of the comfort and freedom this gives. It enables the cow to lie down easily on either side, placing her body and head in as restful a position as if she were not tied at all.

Think of how comfortable the sloping corners of the stanchion are for the neck and how safe for her feet. No danger of a cow getting a foot caught between the bottom of this stanchion and the curb.

Don't worry about the twisting strain on the hinge at the bottom. The Louden Stanchion is strong where others are weak. It is reinforced and riveted and is of very great strength.

And, remember, you can open the latch of the Louden Stanchion with one hand, but it can never be unlatched by the cattle.

Like Louden Stanchions, Loudon Stalls are built of smooth, high-carbon steel tubes and excel in durability, simplicity, cleanliness and comfort.

The Louden Y Stall, illustrated above, is so constructed that when the cow enters the stall she immediately places her head right into the stanchion. When tied she can easily turn her head and lick herself.

The Y Legs prevent the cow from working hay and other feed out of the manger into the stall and wasting it.

The Y Legs and uprights are so firmly clamped together with Louden's telescoping dust-proof couplings that this patented Louden Stall combines all the strength and good features of the double or triple post stall.

The Louden Machinery Co.,
of Canada, Limited
No. 628 Crimea St., Guelph, Ont.

Branches at Winnipeg, St. John, N.B., Quebec and Vancouver also the Alberta Dairy Supplies, Limited, Edmonton, Alta.

This stall is patented by the Louden Machinery Company. Its construction is exclusive to Louden's. There is no other similar stall on the market.

With Loudon Barn Equipment, you can keep cows clean, comfortable, and contented. You can save time, labor, and money. You can save feed and straw. You can get more milk from your cows.

DO NOT DEPLETE POULTRY STOCKS

Judging from the unprecedented heavy deliveries of poultry on the central eastern markets so early in the season, it would appear that farmers and producers generally are not only depleting their flocks unwarrantably but also rushing them to the market in an unfinished condition. As a result, the current price of chickens is much below normal value at the present time, in comparison with the prices of other meats. This is directly due to the overloading of the market.

With the brisk inquiry for Canadian poultry from Great Britain, it is expected by exporters that the demand for well finished, good quality stock will be very keen during the coming winter. Besides, there will be a good demand for home consumption. The price for well-finished birds continues firm, but with so much poor stock arriving wholly unsuited for export, many buyers have recentl yreduced their quotations for all low grades.

The presence of pullets and young fowl has also been noted in many shipments. This is most unfortunate considering the price of eggs. The very firm prospect for the profitable marketing of all poultry products points to the necessity of conserving in every possible way all suitable laying and breeding stock. Unless this is done ,there will be but little poultry left the eastern portion of the country. Even in a short time on the farms in the central, though feed is scarce and high, it would pay farmers to finish the birds before offering them for sale and spread their deliveries over a longer period.

Current receipts to date have consisted mainly of live poultry. The season is now sufficiently advanced, however, to warrant more liberal shipments of dressed poultry. In light of the fact that there will be a considerable movement of Canadian poultry to Great Britain, it is of the utmost importance that all poultry killed on the farms, in addition to being well-finished, be properly killed and dressed. The British market, in fact all large markets, prefer poultry bled in the mouth and dry picked. While killing by dislocation may be preferred by some, the presence of blood in the neck and the resultant discoloration make it unsuitable for storage or export purposes.

Lawndale Stock Farm

Jerseys and Shorthorns (Pure Bred)

Jersey Offerings for the Winter of 1919—20

A few registered mature cows due to freshen the coming fall and winter.

Several yearlings, bred and not bred, registered and grades.

BULL'S CREEK FARM

R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" wbose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter eacb in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a beifer calf or two. Get your orders in quick, tbey won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

Phone or write,

R, L. HICKS

DALHOUSIE JCT., - - - N. B.

FOR SALE

Pure Bred Registered Percheron Stallion "King Ferdinand", foaled March 16, 1916, pure black in color, broken to work, weight 1600 pounds, sired by Gresham, champion of Maritime Provinces. Dam, Lady Belle, equally undefeated.

This is a splendid opportunity to secure a horse of exceptional good breeding. Inspection of stables solicited.

For Prioe and particulars, apply

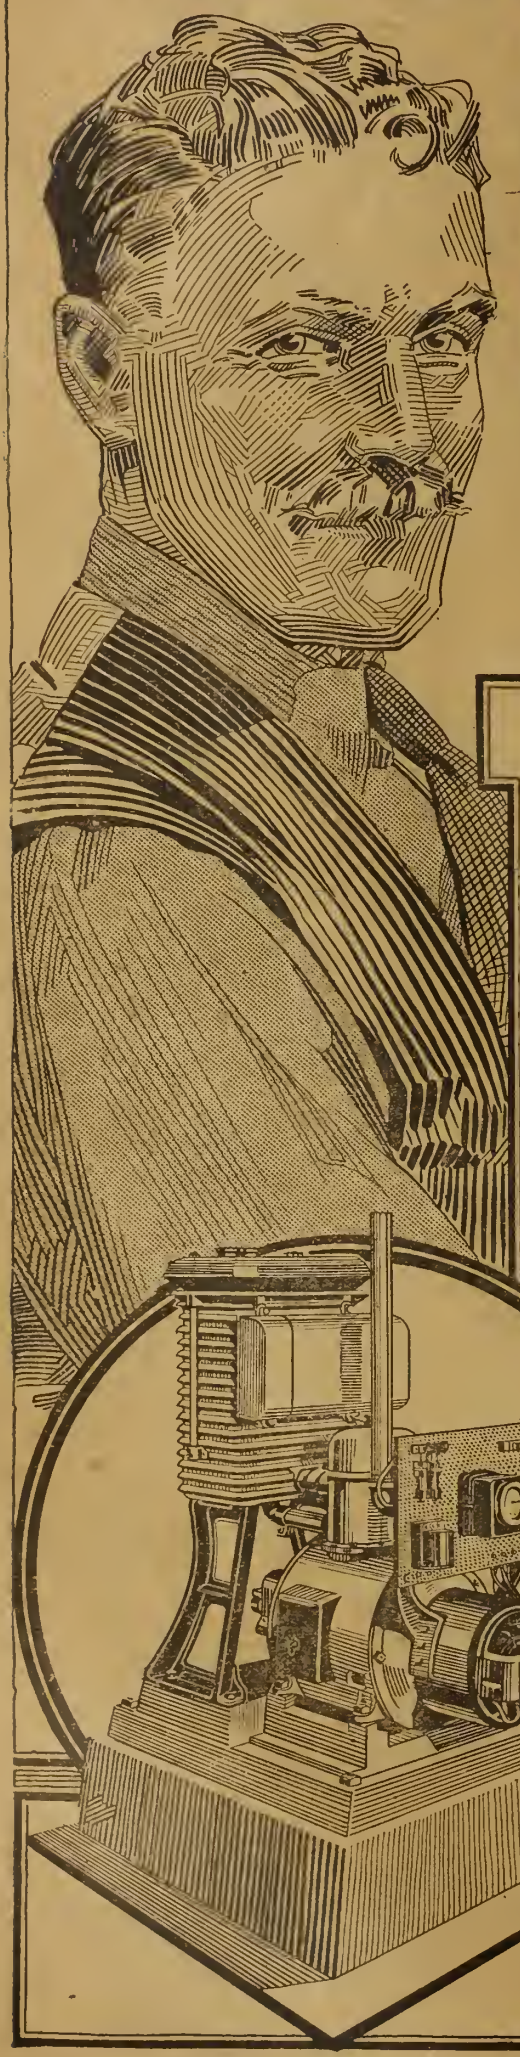
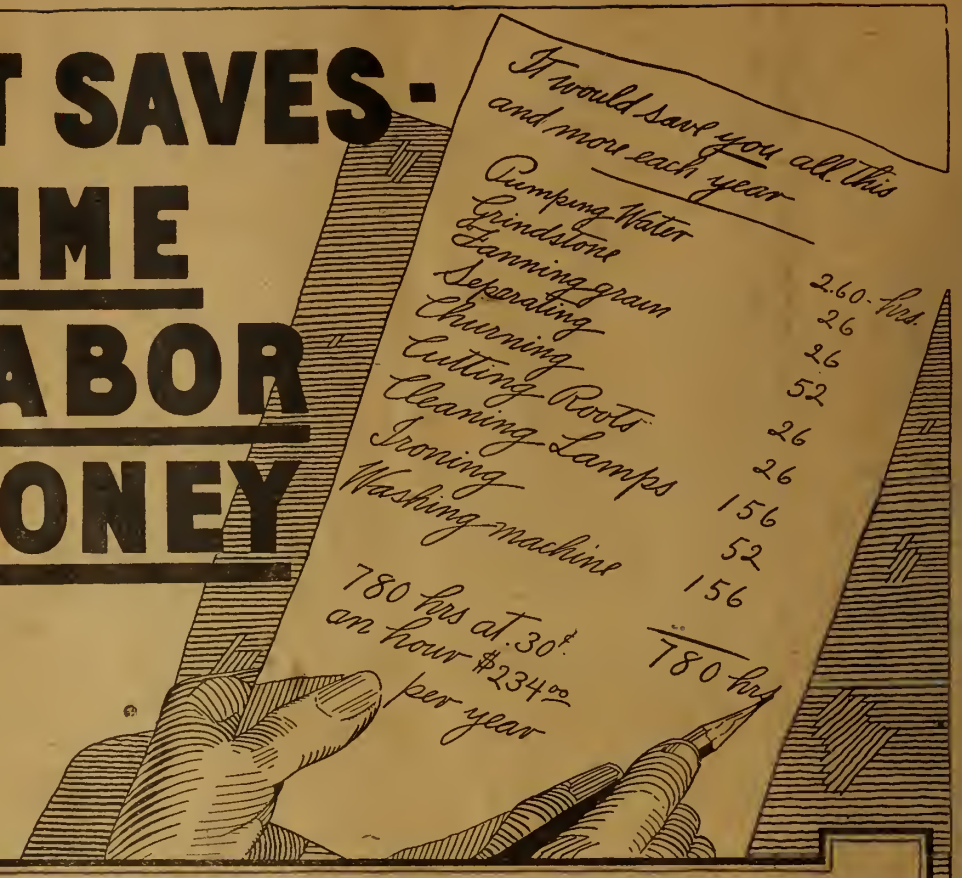
THIS PLANT SAVES - TIME LABOR MONEY





THINK, $234 a year saved on only nine of the necessary chores about the farm. Picture the many other jobs that could be time and labor lessened.—Picture the convenience of an electrically lighted house and barns. Figure how much more money you could bank yearly if you farmed with the twenty-four-hour-a-day help of

Northern Electric
POWER AND LIGHT

From a dollar and cent viewpoint—electrifying your farm is the most far-sighted investment you could possibly make—your yearly production jumps immediately. Your live-stock increases in value, for clean, sanitary surroundings make contented cattle.

Fresh running water is a boon to any farm.—Not only in the barns and dairy, but for sanitary purposes in the household, the Northern Electric Plant will cheaply and efficiently pump all the water you need. In case of fire it is ready for immediate service.

Power milking and dairying will enable you to keep more cattle. The demand for milk, cream and butter offers you rare opportunities.

The women folk on the farm find in electric power the solution to health-breaking tasks. All the labor-saving of modern electrical appliances is theirs with Northern Electric Power and Light.

You can electrify your farm with Northern Electric Power and Light for less than your hired man costs you for one year's work, and what you now pay for coal oil will maintain and operate it.

There is a Northern Electric Power and Light Plant in the size your farm needs. Our nearest house will send you interesting literature upon request. Write to-day.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

LOUDEN

Barn Plans Will Save You Money

LIKE many other farmers, dairymen and stockmen, you are going to build a new modern barn or remodel the old one.

If you go to a regular architect and have him draw up plans for you, it will cost you a lot of money. And a regular architect has very little, if any, experience in planning barns and is unqualified to give you the best advice on the construction of a modern barn. If you make the plans yourself you will make some technical mistakes that will prove costly.

It was to save money for farmers and to help them build more satisfactory barns that the Louden Architectural Department was organized.

This Department is in charge of an architect who specializes on planning barns. He has planned so many Canadian barns that he knows just the kind that are most suitable to Canadian farming conditions and Canadian weather. His advice would be worth scores of dollars to you.

Tell him what kind of stock you want to house, the number of animals, and your ideas of what would best suit you, and if possible, if you are remodelling, send a rough sketch of your old barn, showing location of windows, doors, supporting beams and columns, etc., and indicate the roadway, the well, the south side of the barn, and the location of your house.

Section of Louden Cow Stall.

Our architect will supply you free floor plan suggestions.

If you are not quite ready to go into particulars, send for our Barn Plan Book. Send for it anyway. We will mail it FREE to those who fill in and send the coupon.

This big 112-page book is not our catalogue. It is a book of 74 barn plans carefully selected from hundreds of Louden-planned barns that have been erected in Canada and the United States. It will give you the very latest ideas in modern barn planning and construction.

Besides barn plans, it is a regular encyclopaedia of information on the values of different kinds of building materials. It deals with ventilation, drainage, and lighting. The chapter on the mixing and laying of concrete is worth many dollars to the man who is going to build a modern barn. But we cannot tell you about this big barn plan book here, so send for it and see for yourself.

And when ordering equipment for the new barn remember that a Louden-equipped barn is even more important than a Louden-planned barn.

Louden Steel Stalls and Swinging Stanchions are easy to keep clean. There are no dirt catching nooks and corners—no wood to absorb moisture or odors. The smooth, steel-tubing construction is handsome, durable and sanitary.

Louden Y Stalls are patented and are obtainable only from us. They combine the strength and convenience and feed saving qualities of the double and triple post stalls, while giving all the freedom of the single post stall. They permit the use of the feed-saving Built-up Manger Curb.

Louden Swinging Stanchions give cows all that head-turning, body-moving freedom that is so necessary to keep an animal comfortable and contented. By replacing your old stiff stanchions with Louden Swinging Stanchions there will be an increase in the milk flow that will soon pay for the new equipment.

Louden Stalls and Stanchions, as well as other Louden lines, are fully described in Louden's General Catalogue. If requested we will include it with the Barn Plan Book if you will fill in and send us that coupon.

That is the easiest thing you can do to-day—to send that coupon. It will only take a very few minutes. When you get the books you will agree that you never spent so short a time to such good advantage, for these books will show you how to save money by better planning and proper equipment.

Name .....

P.O. .....

Province .....

Chase power is driving power

Both rear wheels get the same steady driving power

There the Chase differs from other tractors.

It has no differential gears.

No matter what trouble it may get into, what obstacles it meets, however rough or uneven the going may be, the power of the Chase drives both rear wheels to pull through.

Differential gears add nothing to the operation of a tractor.

They do cause many tractor troubles.

When one wheel strikes an obstacle, the differential throws the power into the other wheel—where it is least needed—and makes the tractor practically a one-wheel-drive machine.

That is why some tractors cannot pull through when they get into holes or bad going. One wheel goes "dead" and the other spins. The power of the motor cannot be used to move the tractor.

So The Chase Stays on the Job

The Chase Tractor, having no differential gears, has an equal positive drive on both rear wheels, and thus gets the full benefit of the driving power of the heavy-duty motor.

This means that the Chase is not easily blocked, and consequently stays on the job more hours per day.

Less Strain, Less Wear

And this no-differential feature of the Chase insures longer service because it avoids uneven wear of parts.

Even in ordinary plowing on the level, the side-draft has a tendency to make one wheel do more work than the other. A tractor with differential gears cannot pull evenly under that side-draft. It becomes again a one-wheel-drive machine. It gets uneven wear and uneven strain, which must shorten its years of service.

The Chase Tractor pulls evenly—and so wears evenly.

Also Saves Kerosene

It also operates more economicallv—uses less fuel.

For two reasons. First, driving through gears wastes about 10% of the power. The Chase saves that 10%. Second, the even pull requires less power and uses less gas.

This no-differential feature of the Chase Tractor is but one of many evidences that the men who make it know what a tractor ought to be. From the heavy-duty Tractor motor to the smallest bolt in its construction, the Chase is "built to build goodwill."

World-wide Industry

Canadians build the Chase—in Canada. Canadians build the Chase that is sold in Great Britain and foreign lands—yes, and also in the United States. The Chase institution was created to establish in Canada a world-wide tractor business founded on Canadian principles of doing business. The men behind it, R. J. and W. J. Cluff, are men of high manufacturing ideals. They are exacting in their demands. They want the men who buy Chase Tractors to make money out of them. They are determined that every customer shall receive the service he requires to keep his Chase Tractor always at its best and always "on the job."

You can make Money with a Chase

You will find it to your advantage to deal with an institution with these ideas of service. You will find that the Chase Tractor is a piece of machinery that will gladden your eye. If you haven't seen it, be sure to do so. Or, write for illustrated literature and detailed information. We will send it promptly and tell you where you can see a Chase Tractor.

SPECIFICATIONS

Motor—Buda Model H.T.W. Heavy duty, Tractor type 4 cyl. 4¼" bore, 5½" stroke. Set crosswise of frame. Every part readily accessible. Extra large water passages for cooling. Force-feed lubrication, thorough vaporizing of low-grade fuels. Heated and "water washed" air.

Fuel—Specially designed to burn Kerosene or low-grade gasoline.

Drive—No differential gears are used, the drive being direct from the transmission to outer rim of wheel through bull pinions and gears. Both bull pinions and bull gears cut from forged steel and case-hardened.

Transmission—Fully enclosed and running in oil. Myatt roller bearings. Very simple type. Gears accurately machined from high grade steel.

Chain Drive—Power is delivered to the transmission gears by a wide chain fully encased and running in oil.

Belt Pulley—In direct line with crankshaft—no bevel gears. Located at side—best position for lining up with the machine to be driven.

Control—Driver has unobstructed view. Control levers are simple and easy-working.

Turning radius—12 feet circle.

Co-Operative Stores and Otherwise

Farmers can Save Money by Co-operation--Why Does Woodstock charge branch U.F. a Profit ?---Shareholders are not Just Satisfied

One feature of the United Farmer Movement in this province has been the establishment of a string of stores —designed by their promoters to redce the cost of supplies to the farmers of this province. Much has been and is being promised in the way of reducing the daily expenses of the farmer through the operation of these mercantile establishments, in fact, so much has been promised that the Maritime Farmer proposes to deal frankly with the whole question.

For several years the Maritime Farmer has been assisting farmers in the Maritime Provinces to secure through co-operation, cheaper feeds, flour, fertilizer, seeds and goods which can be purchased in car lots and handled to advantage on the track.

Careful study of the situation convinced this paper that co-operative stores, unless conducted by men of experience and ability (and such men command high salaries) cannot be run with the hope of paying a dividend on the investment, and at the same time result in any appreciable saving of money to farmers who invest in them. Time and again this advice has been given by us.

In normal times co-operative stores have repeatedly failed in the Maritime Provinces—simply because good management and sound judgment were not brought to bear on their affairs. Therefore, at a time when conditions are abnormal, when goods are costing many times more than a few years ago, when largely increased capital is required to stock stores and when the risk of declining prices is being received with apprehension by all sane business men, the Maritime Farmer feels justified in warning farmers against investing their money in enterprises which may disappear in bankruptcy—should the markets break and the owners find themselves loaded with stocks, the selling values of which may rapidly decline. That was and is the judgment of the management of this paper—and we have purchased hundreds of thousands of dollars worth of merchandise for farmers in the Maritime Provinces.

But while men of undoubted business capacity were treading cautiously—recognizing that supply and demand are still the big factors which govern prices and determine success or failure in busniess—the Unted Farmer stores, with all their glittering promises, were launched.

The scheme was for a central store at Woodstock—with branches in various places. In the case of branch stores, ten per cent. of the subscribde capital is taken by the head office and the balance is left to the branch store for working capital. The head office buys supplies for the branch stores, but only to the extent of the capital raised by the owners of the branches.

And here comes the rub. **On every sale of goods by head office the wholesale price of an article is charged plus a profit for the service rendered by Woodstock.** Why? That is what the Maritime Farmer fails to understand. Here, is a branch, which has already handed over ten per cent. of its capital to Woodstock— and is then called upon to pay second profit—when the owners of the particular branch might go on the market and in many cases buy as cheap—and in some instances buy at lower figures than the head office of the United Farmer. Why should this be done? If the Maritime Farmer may be permitted the vernacular—you may search us.

How about the money that was to be saved for the farmer? One of the most hated individuals in the world—let the United Farmer booster—is the **middleman.** Language fails to paint that criminal in his true colors. He has been described by impassioned orators, some of whom are paid by Winnipeg, as a crook of the deepest dye. **Yet here is the head office of the United Farmers at Woodstock, entering fully into the middleman's game by first relieveing branch stores of one-tenth of their capital and then charging them a profit on goods, which it has been pointed out, can be bought quite as readily by any body of farmers who desire to invest their savings in a store, and as we have said at prices quite as low as Woodstock can buy. So you see the horrible middleman appears in the form of Head Office of the United Farmer, Woodstock.**

While there is a serious phase to this feature of the business as it is conducted, the operations in connection with booming stores have not been without their humorous side. Some time ago the United Farmers bought some horse blankets and overalls at an attractive price. These goods—like everything else in the country—advanced in price and were offered at increased prices in stores in all parts of the country. So the agents of the United Farmers at Woodstock were sent broadcast to sell overalls and horse blankets at a reduced cost—and at the same time to impress upon buyers the ability of the United Farmer stores to duplicate the performance in other lines of merchandise—and thus save the farmer many dollars every year.

Let us see how these promises of cheap merchandise have been fulfilled?

The Maritime met a stockholder in one of the United Farmer stores the other day and was rather startled, when the stockholder asked: "How are we to get our money out?" It was not, mark you, "How are we to put our money in, but how are we to get it out?"

This suggested that something was amiss—and there is. Near this particular store is another, run by the owner, who looks after his own business and does his own buying. **This store undersells the United Farmer store in many lines and as a result the shareholders of the United Farmer stores are actually buying from their own competitor and saving money by so doing.** But still farmers are being urged to put money into new stores and are being promised all sorts of savings. We want to just put this instance fairly before the farmers of the Maritime Provinces for their guidance and in full support of the belief of the Maritime Farmer that nine out of ten co-operative stores, unless conducted by well paid and capable business men—cannot possibly undersell anybody—but in most instances charge more for goods.

There is another striking feature of the United Farmer stores which it is well to call attention to. Recently a seven per cent. dividend was declared. But in addition to that, according to shareholders, a second dividend has been promised on yearly purchases. That is a percentage will be paid from porfits on the total amount of goods bought from these stores during the year.

Do you grasp what this means? Suppose you are not a shareholder? If you buy from a United Farmer store you not only help to pay a seven per cent. dividend but you also help to provide an additional dividend on stocks purchased by a man who perhaps has fifty dollars invested in the business. Shades of business Napoleons—you were sorry figures in the art of merchandising compared with these geniuses who profess to save **money for farmers on one hand and promise to pay two dividends in a single year on the other.** Mr. Farmer here's the greatest get-rich-quick scheme ever presented.

But, alsa! Let us see how the thing works out. The Maritime Farmer has been doing some buying for farmers. It now has on the road cars of feed and flour which it sold to farmers at these prices:

Bran, per ton.....$47.90 delivered
Flour, per bbl..... 14.05 delivered
Shorts, per ton..... 54.90 delivered

At least one United Farmer store is selling shorts at $60 per ton, or five dollars and ten cents more per ton than this paper is supplying farmers in many sections of the Maritime Provinces. That is the statement of a shareholder in this store.

Take another example. We sold cotton seed meal with a test of 36 per cent. prótein for less than $4.00 per bag. What did the United Farmers charge for cotton seed? You know if you bought it. We sold oil cake meal at $4.30 per bag, 34 per cent. What did you pay for yours?

In buying seeds, this year, the Maritime Farmer got in wrong. But it has supplied red clover as low as $63.50 per cwt., timothy at $17.50 per cwt. and Alsike at $56.50 per cwt. These prices were later exceeded because orders came in late and on a rising market. But even at the higher prices we have saved money for scores of farmers in this province and Nova Scotia. Had our purchasing agent not been ill in December, we would have been able to supply seed at $60.00 per cwt. for clover, $16.50 for timothy and $52.00 for alsike. These prices are all for number one stock. You who buy this year from any source, will have an opportunity of placing these prices against those quoted for seed and you will then be able to determine how far the claim of the Maritime Farmer that co-operation may best be carried on under our system, is justified. We have no capital to pay dividends on. We supply feeds at cost. On seeds we charge one-quarter of a cent per pound for handling. These prices are open to any reader of the Maritime Farmer, and we expect that next year we shall handle many times more in value than we did this year.

At the recent meeting of the Farmers' and Dairymen's Association the representative of the Maritime Farmer in discussing the question of co-operation found much support from among farmers in its stand that co-operative stores must be well managed, if they are to pay. Certainly they have a heavy handicap when subjected to the additional charges for maintaining a head office, as at Woodstock. Co-operation should be based on the determination of farmers to buy where they buy cheapest. The Maritime Farmer would not ask any farmer to buy goods through its service, if he can buy cheaper through any other channel. It is just a cold blooded business proposition with which sentiment has no connection. So far as this paper is concerned, it is not out to sell gods, but to buy them to best advantage on the open market and hand them along to the farmers. It is the ideal way to co-operate and it makes losses almost negligible.

The N. B. F. and D. Ass'n. in Annual Convention

The Forty-fourth Annual Convention of the New Brunswick Farmers' and Dairymen's Association held in the Assembly Hall of the Provincial Normal School, Fredericton, on the 16th, 17th and 18th inst., was conceded by delegates who have been in regular attendance for many years, to be the best in the history of the Association. The writer has not missed a session in fifteen years and his observations corroberate the statements made in the foregoing respect by the enthusiastic farmers delegates.

The Attendance

Despite the pranks of the weather man in so piling up the country roads with snow and frozen sleet that many districts remote from the railways were practically isolated for the time, and certain branch railway lines being somewhat uncertain in operation, the attendance was particularly good. The report of the Credentials Committee showed that of the one hundred and fifty-four Societies operating in the province sixty per cent. were represented by one and at least fifty per cent. by two delegates. A goodly number of non-delegate farmers were also present, bringing the attendance to well over the two hundred mark.

The delegates, as a rule, were regular in their attendance at the various sessions. They came early and stayed late.

The Programme

An instructive and interesting programme had been prepared. No better proof of the appreciation of the delegates could be secured than the fact that they took an active part in the discussion and as was the case on Wednesday evening, the hour of eleven found the majority of them eager listeners in the Convention Hall.

The programme dealt with many subjects of interest to the farmers of New Brunswick. Every delegate who had a resolution to introduce had the privilege of reading it in open convention before passing it over to the resolution committee that the other delegates would have the opportunity of thing it over and be thus prepared to intelligently discuss its pros and cons and vote accordingly when the subject matter came regularly before the convention. There was not one instance in the whole convention where any farmer's view was limited by being held down to a certain length of time.

The President's Address

C. F. Alward, the president of the Association, was chairman at the various sessions. He conducted the meetings with promptness and due attention to Parliamentary procedure. This was the second occasion on which he has graced the presiding office of the Association.

Mr. Alward is one of New Brunswick's most intelligent farmers. In years gone by he has done a considerable amount of Farmers' Institute work not only in his native province but also in the provinces of Nova Scotia, Prince Edward Island and Ontario. His intelligent grasp of the various subjects under discussion at this year's convention eminently fitted him for the honored position held by him and won for him the hearty vote of thanks of the delegates so cordially extended at the close of the sessions.

We take pleasure in publishing the president's address in full as follows:

Gentlemen and Fellow Farmers:

Another year has passed and we are again called together on this, our forty-fourth Annual Convention of the Farmers' and Dairymen's Association of N. B.

It is now fourteen years since I was last called on to occupy this honored position as President of this general meeting and I wish to thank the members of this Association for reposing in me such confidence. While greeting you at this Annual Session, let us not forget to place the emphasis on Him who has blessed and guided us through another prosperous year.

Many and varied are the problems to be solved and we must look with a good deal of patience and strong confidence to the great men that today hold in their hands the destinies and basic principles that emanate from true democracy.

We are now looking with a good deal of expectancy to the time when the world will know for a surety that nations will war no more and peace and harmony will be inscribed on the banners of all countries.

We have met together again to discuss and deliberate on the best methods to be adopted in our farm work and management so that we may the better take our proper place in the onward march of progress in the financial and commercial world. Not only should we bend our best energies to the solving of our economic problems, but we should strive to raise our social standing to a position that is not only equal to the city life, but will be envied by our urban population. To reach that desired end it will be necessary to take such steps as will break down that clevage or wall of social jealousy that truly exists between the rural and urban population of our country. If our city friends are enjoying and living on a higher plane of social life, would it not be well for us to see to it that proper education of our young boys and girls in country life be given so that a more congenial disposition may be manifest between them. Have we ever stopped to think why it is that our rural population—boys and girls, young men and young women—are so strongly drawn to city life. Some may say, shorter hours, greater wages for labor, but I would say it is from the natural instinct dominating in the young mind, leading them into closer touch with the activities of social life which is congenial to the boy or girl between the ages of 16 to 20.

We are naturally gragarious creatures and wish to be in company with each other and the country boy looks upon the city chap as superior in social attainments because he has privileges of reaching those qualities in city life that are not so easily obtained in rural districts. What then is to be done to check the serious depletion of our rural population for city life? We cannot look to the city folk to stem the influx of population to their towns. If we could have the privilege of reading the biographical history of the men at the head of the large commercial firms of our cities and towns, it would reveal the fact that seventy-five per cent. were reared and characters established in the homes of rural districts and country villages, and it is natural to expect the managers of the large operations in our cities are over anxious to get hold of the village boy that he may be educated in these establishments so that he may be able to take charge and carry on the business successfully when he (the manager) wishes to retire to private life.

If there is any one thing that is more deplorable than another to the best interest of agriculture in these Provinces, it is the fact that our boys and girls are leaving the farms for city life. The great loss to this country was not in the sinking of so many heavy ladened cessels of food stuffs in the ocean by the enemy in the Great War that has just ceased, but by the great sacrifice of the young manhood of about 60,000 of our Canadian boys.

The mothers, fathers, wives, brothers and sisters are now realizing as never before that they are not the united family they once were, but in nearly every home from one to three vacant chairs are found, which fact brings grief and sorrow to the hearts of the remaining members of the family These are the people that have made the greatest sacrifice.

We are told by men in high authority and at the head of state affairs that the antidote for all our ills that follow from high cost of living can only be realized by greater production. But how can we expect an increase in farm products if the manhood of rural districts that have played their part well overseas and have been spared to return to us, and the boys and girls reaching manhood and womanhood, wend their way to the cities and find employment there.

If the Council Boards of our cities and towns, who have the housing and labor problem on their hands, would consider the suggestion of building houses in the rural districts of our country for their own crowded population, the farmers would shoulder the responsibility of giving employment, and thus a better equilibrium would be realized between producer and consumer.

True, there has been a levelling process going on for a number of years that is beginning to be felt in our densely populated centres and rural districts. The introduction of the gas engine, telephones, automobile and motor truck all tend to elevate farm life and make it more congenial to the rising generation. The status of education in this Province is becoming a serious problem—not so much that it lacks in system, but the solving of certain problems involved in that system. This problem is the question of teacher's salaries. Those who are engaged in the teaching profession today are barely existing and some cannot meet living obligations. Other enterprises and other callings or occupations in the commercial world are willing to pay a better and more remunerative wage for the intellectual ability of the aspiring young man or woman seeking employment, and the result is, that not only are the young shunning the profession, but the older ones now engaged in the work are drawn from it.

I am credibly informed by one of the teachers in the High School in Moncton that the janitor of that school is receiving a higher salary than the Principal. This ought not to be. I am not finding fault with the janitor's salary—he may be getting only the amount he deserves—but the Principal of that school spent the greater part of his life to equip himself and make himself efficient for his work, while the janitor could equip himself for his position in a very short period of time.

Joseph Hirsch put the subject very clearly when he said, "We cannot expect men to remain on the farms unless the farms are profitable. Nor can we expect men and women to remain in the country unless their children can obtain the educational facilities that are available to the children of the cities. The very root of the problem lies in this matter of rural education and in the development of a country life that offers, not only profit and education, but health and a fair measure of enjoyment. Farm sanitation, good roads, beautification of farm, the use of rural schools as community centres, all these and many other issues are involved.

Co-operation should be the conspicuous ensign on all the banners of the organized farmers. Through the great struggle and conflict of the world's greatest war the farmers did their part well. This was shown forcibly from the results obtained through the co-operation of the Federal with the Provincial Governments in greater production in food stuffs and the Government of this Province with the farmers should have the praise due them in the splendid results obtained. The dairy interests in this Province has not made the advancement that this country deserves. This Province is well adapted to dairying. While this is a fact we cannot expect that all sections will follow that follow that line of industry, but that many localities will adhere to beef production. But we would strongly urge that every effort be made for an increased production along the line of live stock. To increase and give a stimulus in that direction let us bend our efforts towards the establishment of stock yards together with an abattoir in these Maritime Provinces. This matter should take such a concrete form in these provinces as to make it possible, when a delegation goes to the authorities at Ottawa that they will demand attention and recognition as being an important integral part of this Dominion. There will be time for discussion of this important subject when the different papers and resolutions touching these matters are brought before this Association.

The poultry interest has become of vital importance to the farmers, not only of this province, but the whole Dominion. Ths province is measuring up well with her sister province in the organizing of Clubs among boys and girls for the better improvement of poultry and egg production. The Government has been wise in the choice of a man placed at the head of this department who is an expert and able to so co-ordinate the forces at command that a large financial income may be realized and an aid to greater production. As this branch of Agriculture is in charge of Mr. A. C. McCulloch and it has its place on the programme, it will be further discussed at the proper time.

Sheep husbandry is becoming one of the most important lines of industry in connection with the progres sive farmer. The co-operative selling of wool has forcibly brought before the farmers that are engaged in the business the benefits resulting from united action. If the farmers can receive an enhanced price for their wool through co-operative selling why cannot we receive a higher price for our meat in general if done through united action. The answer is in cold storage facilities being accessible—hence the necessity of establishing such accommodation.

Pork production, the natural adjunct to dairying, is a very profitable business. But the very serious and sudden fluctuations in market prices has, in this province, caused those engaged in that pursuit to hesitate to invest in increased production. The exhibition witnessed at the Fat Stock Show last December at Amherst, demonstrated the fact that we can produce as good a type of bacon hog as in Ontario, and yet we are, and have been, receiving from two to four cents per pound less for our pork than they—because they are catering to an export market.

Bee culture should be stimulated by every means possible—from the fact that sugar is advancing so rapidly in price that it will soon be beyond the ordinary man's ability to purchase Does it not look as if there is a sufficient reason for the Food Control Board or other authorities to look into the sugar refineries operations and ascertain the extent of the profits made while they are buying the raw material so cheaply.

I have only touched on a few of the many problems which we as farmers are endeavoring to solve. There is potato growing, potato spraying, daylight saving time, seed selection, and many other subjects which will have their place in the deliberations of this Association. Let us therefore as

(Continued on page 458)

Gleanings of Agricultural Progress in New Brunswick

COOPERATIVE FIELD TESTS BY SOILS AND CROPS DIVISION

DEMONSTRATION PASTURES HAVE SHOWN THAT PIGS MAY BE RAISED OUT OF DOORS AT SMALL COST

"Pigs is Pigs," the title to an interesting story written by Ellis Parker Butler, has delighted thousands of readers. Used as the title to a story of an experiment devised by the Provincial Department of Agriculture to discover a method of cheapening the production of pork, it may prove profitable as well as entertaining to other thousands unacquainted with the writer's idea; that is, summering pigs on pasture crops.

Farmers in each county who raise pigs cooperated with the Soils and Crops Division, Department of Agriculture, to carry on a series of tests during the summer of 1918 and 1919, to introduce a pasture crop that would give cheaper pork production. The results of the tests indicate that highly satisfactory crops are grain-mixtures, clover and rape.

Forty-eight demonstration pastures were provided for and two hundred and forty-five pigs were pastured in 1918, and two hundred in 1919, while many more were fed in the pens upon green cut rape, clover and peas.

Several popular breeds of swine were represented in the test, viz., Yorkshire, Chester White, O. I. C., Tamworth, Berkshire and Large English Black. The question "which is the best breed as grazers?" can not here be answered, for in no instance were the weights of the pigs secured. But to the question "do hogs make good grazers?" the answer is an emphatic "Yes."

Pasture Crops for Pigs

The plan of the cooperative tests included pasturing on rape, red clover and three different grain mixtures, viz., (a) peas and oats, (b) peas, oats and barley, (c) oats and barley.

Each experimenter received sufficient seed for one acre of ground and a roll of woven wire hog fence to enclose the pigs.

The method of pasturing recommended as to divide the area into three parts and to enclose the pigs upon one section at a time. Thus a rotative system of pasturing was provided for by which the part grazed off would regain its growth while the other parts were being grazed and the pasturage be always fresh and succulent.

The following forage crops were tested:—

(a) Rape sown in rows 26 inches apart, 5 lbs. per acre.

(b) Red clover—a year old stand used as pasture.

(c) Grain mixture, oats 2 bushels and barley 1½ bushels.

(d) Grain mixture, oats 2½ bushels and peas 1½ bushels.

(e) Grain mixture, oats 1½ bushels, peas 1 bushel and barley 1½ bushels.

Grain Mixtures for Pastures

One of the essentials to produce a good pasture with any grain or mixture of grains is that it must be sown thickly, consequently the quantities used per acre in these experiments were greater than is used in ordinary practice for grain growing. The experiments indicate that the mixtures containing the heavier quantities of seed prove most satisfactory.

A mixture of oats 2 bushels and barley 1½ bushels was the lightest sown pasture crop, and contained 123 lbs. of seed. (b) Oats 2½ bushels and peas 1½ bushels contained 175 lbs. of seed and oats 1½ bushels contained 183 lbs. of seed.

Of these mixtures those containing peas were more satisfactory.

Fall preparation of the ground for any grain mixture is recommended. The ground should be well manured so that a rank, quick growing crop will be produced.

Pasturing should begin before the growth exceeds one foot in height, otherwise it becomes so tough as to be unpalatable.

Rape

Rape, which is one of the best plants for pasturing pigs, requires fall preparation of the soil. This plant is a rank feeder, quite similar in this respect to the turnip or cabbage, and requires the same cultural methods. It grows most rapidly in the cooler months and consequently makes the best pasturage during the months of June, September and October.

A dressing of barnyard manure applied either in the fall or early spring and harrowed in before sowing, produces a rapid growth of succulent forage. This crop grows but slowly during hot, dry weather and when tough or stale it is less palatable than the juicy young growth. Broadcasted sowing of this crop has the disadvantage that summer cultivation iannot be given, whereas sowing in rows two feet apart allows frequent cultivation to break up the hard paths along which the pigs walk while feeding; also a fresh change of pasture can be given more frequently, as the crop makes quicker growth. Five pounds of seed is ample for one acre sown in rows, while three times this quantity is used for broadcast sowing.

The reports received from the experimenters say that the amount of other food required by three months' old pigs is less than half the amount ordinarily required, and that old pigs thrive on the pasturage alone.

Demonstration Pastures

Isaac W. Baird, Chipman, ex-president of the New Brunswick Farmers' and Dairymen's Association, said concerning his demonstration pasture:—

"I grazed this year three mature hogs and five spring uigs upon a grass and clover plot of one acre and later, on one-half acre of rape.

"The pigs were turned out at three months of age upon grass, then four inches high, and were put upon the rape at four and one-half months of age when the rape was about ten inches in height. They were given about one-half the amount of slop they would have required had they been kept in the pen.

"The mature hogs, two brood sows and a stock boar, were turned upon grass about May 20th, and upon the rape about the middle of July. They kept in good condition on the pasture crop alone with the addition of water given them to drink. The two sows were removed from the pasture one week before farrowing and were fed extra. Both had good litters. After the pigs were weaned they were again turned out and are now, October 24th, getting more than half their feed.

"The stock boar was four months on pasture alone and fully maintained his condition during this period."

James Easton, Farm Manager for R. A. Snowball, Chatham, N. B., said: "One-half acre of rape and one-half acre of mixed grain maintained eleven old hogs for three months.

R. L. Hicks, Dalhousie Junction, ex-president of the Holstein Breeders' Association, pastured six pigs for fourteen weeks on three-quarters of an acre of red clover.

McIntyre Bros., Springbrook Farm, Sussex, report on the oats-barley-peas mixture as follows: "One acre was sown on spring ploughed sod June 17th, and pasturing began six weeks later on July 24th. Twelve five-months' old pigs were turned out to graze and fed in addition one-half the usual quantity of mill feeds and 100 lbs. of skim milk daily. The pasture was divided into three plots and the pigs changed about every week. We consider the pasturing plan gives good value."

Location of the Pig Pasture

A favorable site for a pig pasture is one governed mainly by its convenience to the feeder.

Where a location can be had near the farm buildings and adjacent to a frequented farm lane the thrice a day chore of feeding the pigs becomes an occasional pleasure only. An ideal situation for a pig pasture on many farms can be had by using the waste area of ground surrounding a duck pond, swamp or spring brook, so frequently an ugly feature of the farm layout. Such locations contribute a great deal towards maintaining the health and comfort of the pigs because of the advantage of the "wallow," so necessary a provision to their well-doing. Pigs perspire very little and suffer from heat, consequently a "wallow" and shade of some large tree within the pasture to give shade and protection is an essential feature of a pasture.

The swine raising industry in the province has received an impetus from the carrying out of the experimental pastures, for the test showed that pigs may be raised in large numbers without any cost for special housing, and the out-of-doors mode of living contributes to an extraordinary thrift, cheap gains and consequently greater profit.

O. C. HICKS, B.S.A.,
Instructor of Soils and Crops Division,
New Brunswick Dept. of Agriculture,
Fredericton, N. B.

IT'S UP TO MR. GORDON SHARPE

March 19th, 1920.

Gordon Sharpe, Esq.,
Pembroke,
Car. Co., N. B.

Dear Sir:—

I am instructed that at a recent meeting of the Farmers' and Dairymen's Association, you charged that the Maritime Farmer and myself were in the pay of the Manufacturers of this country, to write certain articles which appeared in the Maritime Farmer. Let me say to you that that statement is an unqualified falsehood.

I shall be very glad to have some explanation of your statement by return of mail. I will thank you to give this matter your close attention.

The columns of the Maritime Farmer will be open to you to substantiate any such statement on your part. However, we will expect that you either do substantiate it or that some explanation be made by you as to your remarkable statement.

Yours very truly,
(Sgd.) J. D. McKENNA.

JDM/JAC

ASSISTANCE IN PRUNING APPLE ORCHARDS

Realizing the shortage of competent help, the Horticultural Division of the Department of Agriculture has arranged to provide assistance in the pruning of apple orchards during March, April and May. Mr. A. C. Parker, a practical orchard man, has been specially engaged for this work and his services, together with the part time services of the regular staff, will be available.

The conditions under which this assistance will be given are as follows:

(1) In the event of more applications being received than it is possible to comply with, the decision as to whom assistance shall be given will be based on the judgment of the Department as to the dependability of the guarantees of compliance with conditions and the greatest benefit to be derived from the work.

(2) Each applicant or orchard owner must participate in the work himself, working with the man supplied by the Department, or provide an acceptable substitute to do so.

(3) The applicant must agree to furnish free board for the man or men supplied by the Department, and to pay to the Department thirty cents for each hour of work actually done by each man.

(4) In arriving at the sum total of the amount due to the Department for the pruning of any orchard, the owner must agree to accept the total hours of work done as given to the Department by its men.

(5) The applicant must agree to spray the orchard so pruned to the best of his ability at least twice in 1920, and if at all possible, three times, according to instructions to be given by the Department.

Address all enquiries to A. C. Turney, Provincial Horticulturist, Fredericton.

THE NEW BRUNSWICK PROVINCIAL SEED EXHIBITION

The Provincial Seed Exhibition was held on Wednesday, March 17th, 1920, at Fredericton, under the auspices of the New Brunswick Farmers' and Dairymen's Association, which met for its 44th annual meeting on March 16th, 17th, and 18th.

The number of exhibits was not so large as last year, partly on account of some of the exhibits being delayed through the interrupted train service.

The educational feature of the exhibition is much appreciated by the student body of the Proviniial Normal School. Since the Fair is held in the Normal School Drill Hall, the students avail themselves of the opportunity to make a first acquaintance with the various kinds of seeds on exhibition.

A large number of the samples were sold by private sale directly from the tables and considerable buying by sample was also done by the officers of Agricultural Societies and others.

The judging at the Fair was done by Messrs. S. J. Moore of the Dominion Seed Branch, O. C. Hicks, Instructor of Soils and Crops, and Jas. Bremner, Agricultural Representative of the Provincial Department of Agriculture.

The Annual Convention of the New Brunswick Potato Growers Association will be held at the Agricultural School, Woodstock on Tuesday, April 6th, beginning at 10 a. m.

On account of lack of finances, no Potato Show will be held, but steps will be taken to pay prizes on the Potato Field Crop's Competition.

Some of the things to be discussed are:

Potato Grading,
Fertilizers,
Seed Improvement,
Improvement of Financial Standing of Association.

Plan to attend. The Potato Industry is a very important one, and we must get together to discuss the many problems with which the Potato Grower has to contend.

A. A. H. Margison, President. Jas. Bremner, Jr., Secretary.

The scarcity of certain farm seeds this season will make it imperative that use be made of what is left from last year's supply, provided of course that such seeds have not deteriorated in vitality. Some seeds retain their vitality longer than others. All farmers know this, but they may not know just how old certain seeds may be before they fail to germinate. The best way is to test them before sowing them.

Rotation of Farm Crops

An Address by Prof. J. M. Trueman, at the Nova Scotia Farmers Assn.

Establishing a system of rotation of crops that is peculiarly adapted to his needs is a problem which every would-be successful farmer must necessarily solve. To some farmers it may appear at first sight a difficult one, to others it may seem comparatively simple. However, be that as it may, it is a problem of decided importance to all. More especially is this true at this time when the cost of labor, equipment, seed, fertilizer, etc., has reached an unprecedented height.

When endeavoring to arrive at a solution for the problem, we should first gain a fairly clear conception as to what the term "Rotation" means, the objects in view, and some of the advantages and benefits derived therefrom. Rotation is the term used to designate the system whereby various crops succeed one another in a regular order. The rotation is completed when the last of the crops included in it has been harvested.

The first and foremost object in crop rotation is to secure larger returns from the soil than would be secured should a proper arrangement of crops be neglected. The advantages and benefits derived from rotation of crops are many and vary in importance, but all are worthy of careful consideration. By this means the supply of plant food elements in the soil is kept in a better balanced condition, because to some extent the various crops consume the various food elements in different proportions, and they also have a varying capacity to extract the different elements from the one and same soil. Another feature and one of importance in this connection is the depth of the rooting system of various crops. It is generally known that all crops vary widely in the depth to which they send their feeding roots, therefore, if a rotation included deep rooting crops as well as shallow rooting crops, the former will take food from the soil which the latter cannot reach, thus enabling the farmer to more perfectly utilize the resources which nature has placed at his disposal.

The power which legumes (clover, alfalfa, peas, etc.) have for gathering Nitrogen from the air through bacteria which work on the roots is a characteristic belonging to this class of crops only, and is one which should not be overlooked, in fact, its importance cannot be too strongly emphasized. Since nitrogen is the most expensive element of plant food which we buy commercially, it is therefore a good policy to grow legumes, as they not only gather from the air the nitrogen required for their growth, but there also remains after the crop is harvested a consideable surplus of nitrogen in the stubble and roots, after the decay of which this nitrogen becomes available to the following crops. It is clear therefore that an important economy may be effecter in crop production, if, in every rotation at least one of these nitrogen gatherers is included.

Crop rotation assists greatly in keeping down plant diseases insect injury and weeds. It is a well known fact that the various diseases which affect our field and garden crops are caused either by the growth of some fungus upon or in some part of the plant, or by bacteria gaining entrance to some parts of the plant, e. g., Potato Scab, Club Root, Smuts, Rusts or Soft Rot. The latter is caused by bacteria, while the others are caused by spores of a specific fungus.

It seldom happens, however, that a crop is produced in which there are not some diseased plants. Due to the fact that the spores or bacteria which cause a disease in one class of plants is usually powerless of injury on another, and that they are capable of living in the soil until the next season, and in many cases even longer, it is therefore quite obvious that when a rotation is followed whereby any one crop is not grown on the same soil oftener than once in three or four or five years, it will materially assist in the control of plant diseases.

In the control of insect injury, crop rotation does not play such an important part as it does in some of the other phases, but to some extent each crop has its own insect enemies, and these in many cases are harmless to other crops. The majority of insects at some stage of their life history travel freely from field to field. On these crops rotation has no appreciable effect. There are many, however, which are somewhat sluggish in their movements, and by rotation of crops we to some extent lessen the probability of injury from this class of insect.

The reason connected with the suppression of the growth of weeds which often render rotation an advantage, are in part the same as those observed under the last two heads, because to some extent, each crop has its own specially injurious weed. There is, however, another important consideration. With certain crops there is a difficulty in controlling weeds, this is especially true of most grains whereas other crops such as orots, corn or potatoes or any so-called hoed-crop which requires careful culture, and which comes up quickly and grows rapidly, thus quickly shading the ground, and thereby assisting materially in the keeping down of weeds, and in order to prevent the spread of injurious weeds as much as possible it is expedient to include at least one crop of this character in every rotation.

Besides the seemingly theoretical, but none the less real and practical advantages and benefits, there are others that will certainly appeal to and be appreciated my wide-awake farmers. When a system of rotation of crops is adopted the farm is divided into as many fields as the rotation indicates, viz., three, four, five or six. On each of the fields is grown each year one of the crops included in the rotation. This arrangement will effect an apreciable saving of time both in man labor and horse labor, thereby keeping down the cost of production, which means larger profits, due to the fact that all labor spent on each crop incidental to seeding, cultivating and harvesting is done in the same field, thus enabling the farmer to use to good advantage the time which would otherwise be spent in travelling to and fro betweent smaller areas of the same crop situated at different parts of the farm. There is also an appreciable saving in fencing a farm when it is divided into large fields as compared with fencing many smaller irregular areas.

The progressive, business-like, modern and up-to-date appearance which a good system of crop rotation lends to a farm, incidentally adding to the attractiveness of farm life is a feature appreciated not only by the owner but by all all tourists, and in fact everyone who may happen to pass or visit the farm. Such an appearance gains for the owner a reputation appreciated by all farmers, viz., "A good farmer." which is usually well founded, because a properly arranged system of rotation of crops, with the other farm enterprises equally managed, will fulfill the object already stated.

Upon the planning of the rotation depends its success and value to the farmer. The particular arrangement of crops in the rotation which will prove best must vary with individual conditions, due to the fact that a system may meet all the scientifice requirements and yet be ill adapted to the needs of a particular farmer or gardener. The system which is followed is determined mainly by local conditions of soil and market, therefore the planning of it must be left to the individaul; each for himself to plan a system satisfying at the same time the scientific requirements, as far as possible, as well as the economic requirements of the individual case.

The system adopted may be of three, four, five or even six years duration, and the arrangement of the crops will also vary in accordance. As it is impossible to lay down cast iron rules for every farmer to follow, and it is not practical therefore to arrange a rotation which will suit all farmers in every detail. However, a suggestion may be offered in the form of a rotation that will display an arrangements of crops which in a general way observes the principles laid down.

Four Year Rotation: Turnips, Oats, Clover and Mixed Hay, each for one year. The turnips, which may be either English or Swedes is our rank feeding crop and it is to a crop of this kind that a large part of the manure produced on the farm is applied. The soil can be cleaned from weeds before seeding due to the fact that turnips are not planted until compartively late in the season. It is a rapid grower and shades the ground quickly, it also requires careful cultivation, thus keeping down the weeds. Turnips is the cleaning crop of the rotation, also a deep rooted crop requiring a plentiiful supply of available plant food, particularly phosphoric acid. This is followed by oats, a comparatively shallow rooting crop, also has a vigorous rooting system and does best on old fertility of the soil. It wil also use to advantage a good supply of nitrogen, but too much of this element of plant food is liable to produce a rank weed growth. This will prove particularly true with straw in oats, and this crop will loge very easily if too much nitrogen is present. With the oats, the clovers and mixed grasses seeds are sown, the latter of which will be principally timothy. The first crop will be mostly clover, a deep feeding crop which gathers nitrogen from the air, and is especially benefited by potash. The second crop of hay or fourth and last crop in the rotation will be principally timothy and mixed grasses. It is a comparatively shallow rooting crop and is greatly benefitted by nitrogen, consequently it will use to advantage that part of the plant food which is made available upon the decay of the stubble and roots of the clover crop grown during the previous saeson. The principles which underlie rotation, it will be seen, are fairly well met in this rotation: The crops included demand the various elements of plant food in different proportions. There are deep feeding and shallow rooting crops, a cleaning crop and a nitrogen gatherer. As aforesaid, the system may be modified to suit different conditions, for example, potatoes, corn, mangels or sugar beets may be grown instead of turnips, and wheat or barley may be substituted for oats. The second crop of hay may be used as pasture, or a grain crop may be grown instead of either, depending upon the needs of the farmer in question. If more forage crops are required a five or six year rotation may be followed whereby practically half of the farm could be devoted to hay or pasture.

It is not my purpose, however, to discuss the various systems which are in use, but only to endeavor to state some of the principles which underlie "Rotation of Farm Crops" and to offer a few suggestion which may assist in the planning of the rotation. This is one phase of practical farming which is of momentous importance, as a matter of fact, I regard it as one of the corner stones in the foundation of suscessful Agriculture, because the farmer can never hope to secure the maximum returns from the capital and labor expended, unless he has established a system of rotation of crops that is peculiarly adapted to his particular local conditions and line of farming.

SEED SELECTION AND FIELD CROP COMPETITION

Hon. W. M. Lea, Charlottetown

To insure a full crop we must have fertile, well cultivated soil, and good seed sown at the proper time. Much will then depend on the growing season we may have during maturity over this we have no control, but by securing strong, vigorous Seed and by sowing on a wisely cultivated and fertilized soil we may influence to a great extent the yield of our crop. The easiest of these conditions to control is the quality of our Seed. There is no excuse for our sowing any but the best quality of Grain in this province, as we annually export large quantities of this character. It has been proven by experiment beyond question that large, plump Seed produces from six to ten bushels more to the acre than small, lighter Seed out of the same sample, and that Seed selected from a heavy crop produces a greater yield than that taken from a light crop of grain.

The modern separating and grading machine, if properly operated, will grade out all light and small oats, and when any farmer has a quantity of good Grain on hand it will pay him handsomely to grade very strictly and carefully. The Grain culled from his Seed lot will have practically the same feeding value, and his yield may be improved 10% or over without any additional cost clear of the small amount of labour involved. No time should be lost by any who may not already have good Seed on hand for the coming season to secure their supply. It is the greatest folly to sow any light, run out Grain just because it will cost ten to twenty-five cents more a bushel to purchase high class Seed. This is indeed an instance in which wise expenditure is true economy. "As we sow, so shall we reap" has been proven often enough without any further experiment being necessary. Dear as good Seed may seem at first cost, it is by far the cheapest in the end. KEEP YOUR MIND ON THE HARVEST.

Regarding field crop competitions, it is anticipated that changes will be introduced in the Regulations, one of which may be "That the awards of the field judges include a statement as to the origin and merit of the stock seed from which the crop was produced." To be eligible for such competition, providing the change is made, it would be necessary to sow registered Seed, which has been inspected and put up in sealed sacks, to which is attached a special certificate which bears the name of the variety, the number of the certificate issued for Seed, the name or number of the grower and the signature of the inspector.

It is a noticeable fact that the principal winners in this competition to date have been the growers using the highest quality of Seed, and though the change may not be made this year, it will pay to sow nothing but the highest quality obtainable.

Increasing the Consumption of Eggs at Home and Abroad

An Address Delivered by W. A. Brown, Chief of Poultry Division Live Stock Branch, before the Eighth Annual Convention Canadian Produce Association Hamilton, Feby. 10th and 11th, 1920

Introduction

Eggs have been an important article of diet from the earliest ages. Perhaps no article of food is more commonly eaten or served in a greater variety of ways than eggs. The earliest missionaries found the Papans of Europe celebrating a festival at the time of the vernal equinox, (Easter), in which eggs were used in quantities, and even in the depths of Africa the first explorers were offered eggs and poultry in the rude market places of that dark continent.

Commercially eggs have become an important factor in the business of the world. In late pre-war years the world's egg production increased rapidly. Great Britain alone, in 1913, imported eggs from fifty-five different countries, while Germany, in the volume of her imports was a close second.

World-wide consumption also increased. The following table shows the rapid rise in imports of eggs into Great Britain since 1864. There is also included a statement of the value of dried egg yolk, liquid and dried albumen imported during the past five years. No figures are given for 1912, '13 and '14, but the increase in the importations of dried eggs during the war years has been tremendous, it having been stated in England this fall that the value of dried eggs imported into England in the first eight months of 1919 was equal, in its equivalent of shell eggs, to the total importation of Russian eggs in 1913.

Table I. Values of Imports into Great Britain

	Eggs		Value of Egg Yolk Liquid and dried Albumen
Year	Value £	Quantity Doz.	£
1864	835,028		
1870	1,105,653		
1875	2,559,860		
1880	2,335,451		
1885	2,931,237		
1890	3,428,802		
1895	4,003,440		
1900	5,406,141		
1905	6,812,476		
1910	7,296,145	183,441,333	
1913	9,590,602	215,799,500	
1914	8,652,800	179,048,083	
1915	6,123,326	102,460,250	845,564
1916	4,742,333	66,080,417	1,393,141
1917	5,067,202	49,224,020	1,459,899
1918	4,621,049	26,564,150	2,804,285
1919	8,613,326	56,443,950	7,149,628

The second table gives a statement of the principal countries supplying eggs to Great Britain in 1913.

Table II.

Countries	No. of Dozen
Russia	114,532,750
Denmark	42,649,416
Egypt	10,965,416
Netherlands	9,773,500
Austria-Hungary	8,836,500
Italy	8,457,916
France	7,022,833
Germany	5,137,416
Sweden	3,849,500
Roumania	2,261,916
Morocco	1,143,500
Belgium	728,833
Spain	122,833
United States	58,666
Portugal	55,583
Servia	45,166
Bulgaria	36,000
Algiers	27,760
Turkey (in Asia)	25,166
China	25,083
Canada	19,500
Gibraltar	13,166

Russian supplies increased very rapidly from 1906 to 1913, some English firms having worked up a very extensive connection in Russia before the war. Ireland was the next largest source of supply, Irish exports of eggs increasing from 54,702,600 doz. in 1904 to 63,982,350 doz. in 1913 to 72,650,410 doz. in 1917.

Germany's imports of eggs increased from 112,578,900 kilograms in 1899 to 137,009,800 in 1909 and 164,753,200 kilograms in 1912.

The Effect of the War on Production

During the war poultry production in most countries was seriously disturbed owing to the scarcity of and rapid increase in the cost of feed. The first effect was a curtailment in poultry flocks practically the world over. In Canada the heaviest movement of laying stock to market took place in the fall of 1915. In England and other countries the feeding of many cereals was prohibited.

For a time the outlook was dark, but soon a distinct reaction occurred which gave poultry and egg production the greatest momentum it has ever received. In the first place poultry flocks were thoroughly culled and large numbers of aged, nondescript stock were sent to market and in the second place the demand for eggs became so keen that prices rose by leaps and bounds. The price of eggs during the last two years has provided the greatest possible incentive for increased production, and the profitableness and practicability of egg production has been brought home to the individual farmer and producer the world over.

The English poultryman is talking of the day when England will be self-supporting in eggs. Holland and Denmark are rapidly re-stocking their farms. France is taking up poultry-keeping as never before. Italy is gripped with the financial advantages of poultry-keeping. Palestine, it is said, bids fair to become a second Egypt. Rumania has already again placed eggs on the British market this past fall. No one knows what the outcome in Russia may be. Mesapotamia is mentioned as a possible source of large supply. China has a vast surplus, while Australia, South Africa, Argentine, Brazil and the North African colonies are looking for an export outlet for their product. The United States with their vast consuming population has a surplus, while the potention possibilities of production in Canada have only been touched.

The effect of the universal tendency towards increased production may not be pronounced this year, but in a year or two it is clearly evident that the World's trade in eggs will be called upon to handle a volume of supply well in excess of the present demand. What then will be the outcome? Will the price to the producer be allowed to drop beyond the point or economical production, or will those interested in the world's egg trade be prepared to undertake such a comprehensive campaign of salesmanship and advertising as will insure a demand well in excess of the supply.

Eggs as Food

Eggs are one of the most palatable, most nourishing and most convenient of foods. In chemical composition eggs closely resemble meat. In nutritive value, they stand between cheese and milk, while in real intrinsic value eggs stand on a pedestal far above their value as ordinarily rated. Investigations conducted under the "New Nutrition" classify foods on a basis of their growth-promoting, disease-resisting powers. In other words, only a limited number of natural foods such as eggs and milk have been found to contain those vitemines absolutely essential to the proper growth and development of the human body and for the repair of tissue so essential in the resistance of disease.

Eggs and milk are natural foods, the only foods, in fact, that contain all the elements for the growth of the young. A chick hatches from and will live for days upon the content of the original egg. A nation's greatest asset is a high degree of public health. Eggs and milk have those elements absolutely essential to a high degree of public health.

Provincial Health Departments, State Legislatures and municipalities spend large sums of money annually in the prevention of epidemics. These epidemics spread in proportion to the vitality of the people. The use of eggs and milk in abundance would do much to promote growth, maintain health and resist disease, all of which constitutes a veritable bonanza of possibilities for the advertising genius that is prepared to undertake a world-wide advertising campaign under the slogan "Eat More Eggs."

Factors that Retard Consumption

The average house-wife views eggs with suspicion. The desire and craving for eggs is held back, dwarfed and blighted by the uncertainty surrounding the quality of the supply. Eggs as laid are one of Nature's most uniform products. No amount of handling or manipulation can improve their quality. The real cause of the uncertainty as to quality is failure to conserve that quality which nature has given.

No act on the vaudeville stage gives more amusement to the public man than the dialogue that is presumed to take place between the house-wife and the merchant in the purchase of eggs, when despite all assurances given, there is recorded the frequent disappointment and chagrin that transpires in the event of a purchase being made. The consuming public want and demand high grade eggs of a uniform quality. Actual misrepresentation in sale and lack of confidence on the part of the consumer as regards quality, combined with the high price for a variable article, are the factors that tend most to retard consumption.

The Fault of the System

In the usual course of events, eggs find their way to the consumer in devious ways. A large proportion commence their journey through the medium of the country store. Most merchants are not particularly interested in eggs, but buy eggs because it enables them to sell goods, and they, therefore, bid for eggs. It is not considered good business for a merchant to refuse eggs, and if he bids low his customer will go to his competitor across the street. As a result eggs are bought at country points by number, without regard to quality.

This system of purchase actually penalizes farmers and others who take pains to produce high-grade eggs, and, moreover, does not only fail to place a premium on good eggs, but actually ogers an incentive for a continuance of careless and dilatory methods on the farm. It makes possible as well, the disposal of eggs in all stages of decomposition and actually encourages farmers and others to hold eggs at seasons of the year hen there is an advancing market.

Some country merchants ship direct to retailers who, in turn, frequently supply the consumer under the caption,—"The eggs are fresh! Yes! Fresh from the country!" The bulk of the receipts go to the wholesale distributor when they are candled and graded.

From June on, candled current receipts show a high percentage of low grades which are slow sale, and a low percentage of higher grades for which there always is a keen demand. The distributor is in a quandary and the solution in the past has been to dilute the best with a portion of the poorest and sell the balance to the best advantage possible, often without due regard to the effect on consumption.

Increasing Consumption at Home

A nation's home market is its largest market. Canada, with a production of roughly 165,000,000 dozen, has a surplus of only a few million dozen for export. The States, with a production of several billion dozen, has a surplus of perhaps nine million. Even England produces more than half of her requirements at home. While undoubtedly the selling price of the exportable surplus will be the controlling element in price, yet the home market presents the most tangible possibilities for increased consumption.

The per capita consumption of eggs in Canada is between three and four eggs per week. Increased to an egg a day, Canada would require an additional hundred million dozen to supply her own requirements, or an increase of approximately sixty per cent. over her present production. Consumption in the United States is about the same as in Canada. Pre-war consumption in England was lower, not over two or two and one-half eggs per capita per week. The possibilities of consumption are therefore equally as great if not gerater than the possibilities of production, especially when viewed in light of the potential consuming power of, for instance, the United States.

Eggs are good food. Deterioration in quality occurs in proportion to the indifference with which the product is handled. On the other hand, consumption varies in direct proportion to the quality of eggs offered for sale and the uniformity of the quality received.

Some wholesalers are endeavoring to establish brands or marks of carbon, and case eggs which would establish confidence in the minds of the consumer. This practice is to be commended and encouraged. Unfortunately, at certain seasons of the year the percentage of really fine carbon eggs is so low that either the distributor must reduce the quality under his mark or fail to fill a portion of the demand. The proposition more often resolves itself into how much the consumer will stand. As a matter of fact, the wholesaler is the victim of circumstances which alone he is unable to rectify.

MARCH 30, 1920.

THE WHEAT SITUATION

In another issue of this aper we publish with pleasure a letter from Mr. Lambert, secretary of the Canadian Council of Agriculture, Winnipeg, in which he takes exception to some remarks by the Maritime Farmer in regard to the government handling wheat this season. There is nothing particular in the article that need be commented on further by the Maritime Farmer, except to say that this paper repeats that it is opposed to government handling of wheat this year. Further than that it maintains that if the government of Canada diverts public monies for the purpose of handling wheat largely grown in three provinces of the Dominion, then the federal government of this country should accord the same treatmetnt to all branches of agriculture. The Maritime Farmer makes no apology for standing behind the interests of the east. The United Farmer movement is purely political to serve western interests. The Maritime Farmer believes we should have more farmers in the legislature but it believes that these men should be elected without any dictation from Winnipeg. We are able to run our own affairs and the amount of western money that is being spent in eastern Canada by Winnipeg to tie us up to their ideals, is enough to warrant the Maritime Farmer in opposing the movement. The Maritime Farmer supports the farmers in the most practical way possible. It has saved tens of thousands of dollars for them without fuss or feathers. We are for farm organization but we want Eastern ideals —not Western.

THEY ARE ONLY FOOLING

It seems that the Maritime Farmer rather pricked the conscience of somebody in Winnipeg. From Mr. Lambert's letter, it would seem that the grain growers really want nothing from the Dominion Government. All these resolutions that have been passed by the western association for exercise. Hon. Mr. Dunning was very bitter in his denuciaation of all and sundry who opposed the granting of this boon to western farmers. The tone of the letter sent us for publication would indicate that this simple little request is all a joke. Not even is it advocated "in principle." And so, according to the Canadian Council of Agriculture, it's all a little pleasantry, but it will be well for eastern farmers to wait and see just what it does mean.

DON'T LIKE THE LOOK OF IT

The Canadian Council of Agriculture objects to the Maritime Farmer referring to the proposition to have the Dominion government market wheat this year, as part of the new "National Policy." Very well, we'll say it isn't, if that will do any good. But both babes have the same parents. They are both offspring of the same organization and have been designed to serve the same interests and the same section of Canada. So we are not particular which way you look at it. The proposition that the government use public funds to handle only one of the many products grown on the farms of this great country, is, after all, nothing to be proud of. We do not blame the framers of this narrowest of sectional propositions for wanting to get rid of it. If the Maritime Farmers never does anything else except expose this particularly parochial attempt to use public funds for the interests of the few, it will have performed a public service.

DOLLARS WORTH THE SAME

For some time at the group of hotels in New York controlled by the New York financial interests and including the Biltmore, Commodore, and Belmont hotels, Canadian money to the amount of the bills of guests has been exchanged at par. The policy continued even when the official exchange rate was 18 cents and the casual exchange rate charged by others in New York higher still. Mr. McE. Bowman, the head of these great hotels, has just made an interesting statement in defence of this policy. He believes that the depression of the Canadian dollar is artificial and that there is no basis for it.

> "Here are two countries lying side by side whose friendship is proven and established by more than a century of continuity. The man from Canada finds every opportunity that is open to the man of American birth. We speak the same language and we have intermarried. Before the war the Canadian dollar was of the exact value of the American dollar. Theoretically its value is the same. The reasons for the depreciation of the British sovereign and the French franc cannot be charged against the Canadian dollar. Canada is a comparatively small borrower and her resources are ample guarantee that all her obligations will be met when they fall due, and to discriminate against her currency only makes for restriction of trade and bad feeling, for either of which there is not the slightest reason."

Mr. Bowman gives expression to what the people of Canada have been thinking for a long time. His remarks lead to the belief that if the problem as it concerns Canada and the United States were approached vigorously, though diplomatically, by the Canadian Bankers' Association and the Dominion Department of Finance, a remedy for a mutually inconvenient and upsetting situation is not impossible.

SECURE SEED GRAIN EARLY

The annual yield of grain on the farms is not on an average more than two-thirds what it might be if a few general rules of seed selection were followed. This fact has been proved conclusively in the field crop competitions, and the work carried on under the Experimental Union at Guelph, where the same crops grown on the same land, under the same conditions, have produced on an average, one-third increase in yield as a result of careful and systematic seed selection. Is that not worth striving for? It is, and the matter of two or thre hundred bushels of grain per farm is quite a consideration in these times of high priced grains and expensive milling feeds. Operating expenses have advanced so greatly that farming today must be carried on in the most approved manner if a respectable labor income is to be made. The good farmers are making money today, but the poor or indifferent ones are just plodding along in the usual way, and the increased receipts obtained for their products are being used in the extra cost of production.

During the war the production of grain was considered the most important phase of the world's agriculture, because it was the basic food for man and beast that could be reproduced rapidly. An entire crop could be grown in one season and the returns were rapid. It is the same today. The war is over, but the call for crop production is just as urgent as it was during the conflict. Prices are high and will remain so until the European countries are able to produce crops almost equal to that of former years. On the other hand, such a situation, although serious from the consumer's point of view, offers an advantage to the farmer in that it enables him to produce a crop of grain time to catch the high prices, and, furthermore, the reward for any extra effort towards the production of a heavier crop is fairly good since the cost of producing a light crop is almost as much as a heavy one. The cost of plowing, cultivating, seeding and harvesting is the same except perhaps a little saving in binder twine and threshing of a light crop.

Of course, it cannot be expected that seed selection alone will increase the yield of grain per acre year after year. It has its limitations, and proper cultural methods must go with it if the maximum results are to be obtained. However, countless experiments and the experience of hundreds of farmers have provei conclusively that seed selection pays and the closer and more thorough the selection the greater the returns. In an experimeit conducted at the Ontario Agricultural College and extending over a period of 21 years, it has been found that the yield of oats from the sowing of large, plump seed was 63.7 bushels per acre, or exactly 12.3 bushels per acre more than that obtained from the seeding of small seed of good quality on the same ground, and under the same condition. On 30 acres of oats that means an increase of 369 bushels. Does seed selection pay? The above figures should leave no doubt.

The practical side of seed selection is not a difficult matter. If 60 bushels are required for seed that amount should be screened out of at least 200 bushels, not out of 75 bushels as is the most common method. That does not mean that the rest of the 200 busels must be discarded as screenings. Their value for feeding purposes has been decreased but little, the only difference being that the larger kernels have been removed. In order to make this selection as good as possible it should be done early in the winter when there is more grain from which to make a selection and more time at the farmer's disposal.

Notes From the Nova Scotia Agricultural College

THE DAIRY SCHOOL

The special courses in dairying are now on at the College. The buttermaker's course, which was completed on the 23rd, had an attendance of 27 students, who came in for this course especiall. The cheesemakers' course began on the 24th.

Of the 27 men enrolled in the buttermakers' course all are going to work in creameries. There is a strong and a growing demand for expert creamery men. This fact makes more emphatic the necessity for a real Maritime Dairy School.

It is a matter for congratulation to those in charge that with the short time and the meagre eqipment at their disposal, they have succeeded so well in training efficient creamery men. None the less no one feels as keenly as these men themselves the need for more time and more adequate equipment. Occasionally a student comes in for the course with keen intelligence, some measure of practical experience and the ambition that holds hime constantly at his task, He gets the utmost possible out of his brief stay at the College, and sometimes accomplishes wonders.

There was one man at the College this year who attended the course three years ago, and who is a good example of what can be done. The years before he came to the College the overrun in the creamery at which he worked, an ordinary country creamery, was 11%. This last year the overrun was 22%. He made 125,000 lbs. of butter, and this 11% gain meant that out of an equal quantity of butter fat he made $7,700 worth more butter in 1919 than with the methods of 1914. He states himself that this gain is due to his training at the College.

Such results as this from a two weeks' course can scarcely be expected with the average student. Probably there is no line of agricultural work in which effective training is as important as in dairying. The above figures give a hint of what is possible along lines of manufacture of butter. From the production point of view the demand is equally strong. The average cow whose cream went to the creameries of Nova Scotia last year produced $50 worth. The best herd reported had an average production of $208.43. What vast room for imporvement there is here!

These mere hints at the possibilities of development in dairying constitute the strongest kind of argument for an adequate Dairy School. If these three Provinces would unite their forces on this point they could supply training in the science of dairying equal to any to be had in Canada. Such a school would also stimulate greatly those general lines of improvement on the individaul farm which are necessary to make dairying really pay, and are equally necessary in order that the Maritime Dairy products may secure a reputation for the highest possible quality.

FIELD CROPS COMPETITION

The Department of Agriculture for Nova Scotia will issue in a few days a leaflet giving particulars about the Field Crops Competitions to be held during the coming season. The conditions are in the main similar to those of former years, with a few notable exceptions. The new condition which needs immediate attention is that regarding the type of seed to be used.

In 1920 no field will be admitted to the Competition except those seeded with either registered oats and wheat, or with seed that has been inspected and approved by the Provincial Department of Agriculture. This proviso means that intending competitors must now look ahead to secure their seed. Full particulars as to other requirements will be found in the leaflet, and farmers are advised to write and secure it.

AN INTERESTING CREAMERY REPORT

Annual reports often seem to the uninitiated very like Ezekiel's vision of bones: "Very many and very dry." With a competent interpreter, however, they can sparkle with interest. We have looked over the Annual Report of the Scotsburn Creamery Co., Ltd., and find it saying some useful things.

This is a purely farmers' co-operative company. It does not pose as a perfect institution, nor does it suggest anything in the way of dictation to its neighbors. It simply tells its story. In the matter of price paid for butter fat it seems as if this company has reached a high mark of attainment. The smaller creameries will not be able to reach it, but Scotsburn is to be congratulated on paying an average price through the year of 63c. per lb., with an average price monthly of 64c.

The overrun for 1919 was 22%. That is, the creamery turned out 22% more butter than it took in of butter fat. One who knows tells us that in 1915 the overrun was 15%. The gain indicated by last year's figures means an increase in earnings of upwards of $17,000 on the 454,159 lbs. of butter manufactured. Here is a gain that is made by efficiency in management, the stopping of leakages, increased skill in the actual buttermaking. In other words, the human element in this creamery was worth $17,000 more in 1919 than in 1915 to the company. Here is a commentary on the value of superior intelligence and of training, such as a Maritime Dairy School could give, which needs no elaboration.

Another deduction easily made when one possesses an inside fact or two runs thus. The seven hundred odd patrons probably average five cows each. The cows, then, sending their cream to the Scotsburn creamery produced about $67.40 worth of butter fat each on an average. One herd, which we happen to know, contains fifteen cows, produced $208.43 worth per cow. The average cow contributing her cream to this creamery has done better than the average cow of Nova Scotia creameries generally, and very much better than some. But, there is far too great a gap between the Scotsburn Creamery's average cow and this particular herd. Here is the spot for a big advance. The first step is to keep the dairy records. Breed up. Weed out the drones,—and feed.

DR. ROBERTSON'S TOUR

Dr. J. W. Robertson completed a most successful series of meetings at Yarmouth, on March 12th. During his tour Dr. Robertson was heard by between three and four thousand people at various points in Nova Scotia.

Any one who knows Dr. Robertson personally, or who has heard his addresses on other occasions, need not be told that his message on this visit sparkled with wit and humor and yet made us all feel the urgency of patriotic and humitariann duty.

To farmers, as such, the burden of his message was that there is still a great shortage of food supplies, and that, in his judgment, the next two years will give the farmers the best opportunity to make money that will occur within the speaker's lifetime. He pointed out also that in this case the personal desire to secure profits by large production at good prices lies along the line of a real service to one's fellows.

In a measure, Dr. Robertson's estimate of the farmer's opportunity at the present juncture may be regarded as an individual judgment. It will be remembered, however, that, as Direc-

Frost & Wood

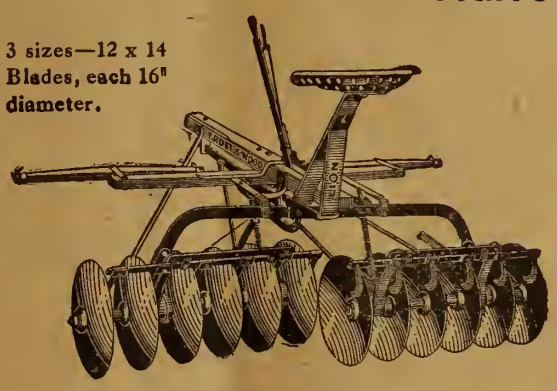
A good discing is the best start for a big harvest

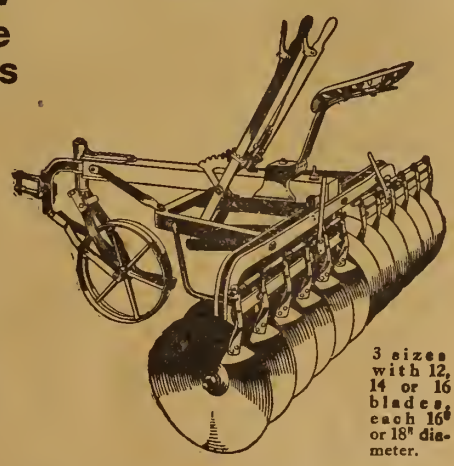
Two "F. & W" favorite Harrows

Give your soil the thorough pulverizing that only a Frost and Wood Disc Harrow can bring. It's a simple, easy job with these light draft implements.

A good seed bed is a long step on the way to a bumper crop.

3 sizes—12 x 14 Blades, each 16" diameter.





3 sizes with 12, 14 or 16 blades, each 16" or 18" diameter.

F. & W. "Lion" Disc Harrow

An old favorite of the In-throw type. Very strong and rigid. Heavy steel main frame securely holds disc sections which turn on dust-proof ball bearings of exceptional quality. One handly lever controls cutting angle of discs and coil springs keep inner discs from rising when angled. Driver sits well back over discs lessening neck weight. Fitted with pole instead of forecarriage if desired.

F. & W. "Champion" Disc Harrow

An Out-throw disc which has earned its great popularity because it has the design and the high grade materials to do splendid work, and remain a stranger to the repair shop. Each section controlled by its own lever. Splendid dust-proof bearings and adjustable scrapers keep the high quality discs turning easily at their work. Fitted with pole instead of forecarriage, or with double wheel forecarriage if desired.

Ask our nearest dealer to show you illustrations of the new Frost and Wood Combination Harrow. We have Farm Implements and Machines for every need. Catalogues gladly sent on request.

HORTICULTURE.

MAKING ORCHARDS MORE PROFITABLE

The present high prices of fruit and the scarcity of really good producing orchards make it worth while to consider cleaning up the old apple orchard and getting a profit from it. As a matter of economy, the orchard should either bear or be cut down. Land is now too valuable to allow any of it to remain unemployed and many of the old farm orchards are today in such a condition that the land is virtually idle. It would be worth more in hay or grain than it is when occupied by an old, decrepit, run-down orchard. On the other hand, there are few, if any, crops which will beat the crop of apples from a well-cared for orchard, either in value or profit, and it is surprising how much can be done in a short time to bring an old orchard back into usefulness.

Whenever pruning is mentioned, many confuse the term with tree butchery. True, some of the so-called pruning done in orchards is nothing less than butchering, but even the inexperienced can do a good job of pruning. It is merely the applictaion of principles derived from the study and control of plant growth.

To do a good job there are certain tools which are necessary. A saw is the first thing which is needed in the old orchard. For the purpose nothing beats the steel-frame, swivel-bladed saw. The blade may be turned at any angle, nearly any cut possible with a keyhole saw may be made, and the steel frame holds the saw blade straight and rigid. New blades may be used whenever the old becomes dull, and by keeping several resharpened or new blades on hand, the work may be done more easily. A small, nrarow-bladed hand saw may do very well sometimes, but in other places it is impossible to get in the proper position to make a good cut. There is one sort of saw, improperly called a pruning saw, which should not be used for pruning at all. This is the double-edged saw so popular in some sections. The main trouble is that while the one edge is cutting where you want it to cut, the other is likely to be working where it is not wanted. An advantage claimed for this type is that there is one set of teeth for dead and one for green wood. However, if a single edged saw is set for green wood it will also cut dead wood, and there will be no opposite edge with set to drag through the cut. If you have a double-edged saw do not throw it away—it makes a good tool if one edge is ground off on the grindstone.

A pair of good hand shears should be part of every equipment. They will remove all the water sprouts and smaller branches smoothly and quickly. The most favored type is one of those which has a single blade cutting with a shearing action against a bar. These are made in the better quality with an adjusting nut which is very necessary in order to keep the blade and bar portions against each other. Only the best quality should be procured if there is much work to be done, and the shears should be large sized, at least ten inches in length for greatest ease of handling. Another very useful tool is a pair of long-handled pruners built on the lines of the hand shears. They will take off limbs of considerable size with little effort and speed up the work considerably.

Some will wish to add an axe to the equipment or use an axe for the only tool. This is all right if the purpose is to take the trees out entirely, but for pruning the axe should be relegated to the scrap heap along with the two-edged saw.

When to Prune

Time is a most important element in any work a farmer has to do. As a rule the farmer has more time in the late winter, along about February and March. For dormant season pruning this is a fine time and it is possible to clean up the job in the slack season. For the average farmer the pruning given in the dormant season is the only one possible and it is, therefore, the one which will be discussed here. It is well to remember, however, that if the trees are making excxessive wood growth and the suckers or water sprouts are very persistent a moderate pruning in June or early July will help slow down the rate of growth. On the other hand, pruning during the dormant season promotes wood growth.

The question of season as a factor in the healing of wounds is often raised. It is usualy conceded that wounds made in the late winter and early spring before growth begins heal most quickly everything considered, but this factor is much overbalanced by the position of the wound in the tree and the manner of making the cut.

Do not leave stubs. A long stub will not heal, but will die and offer an excellent opportunity for decay to get into the main branch or rtunk to which the stub is attached. Make your cuts close to the main branch, or if

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

It's a Fact-You Know
Every Farm Needs Fertilizers

Try as you will, you cannot get bumper crops from your soil if you don't fertilize it. There is no mystery about this. It simply means that, as soil gets worn out, Fertilizers must replace the elements that have been used up.

"Best-by-Test" FERTILIZERS

Best-by-Test Fertilizers have full analysis strength—guaranteed. Write us for particulars and we will advise the kind of Fertilizer to order. We are exclusive Fertilizer experts and can supply all and every chemical required. Farmers can club together and buy in carload lots. Prices on application.

Write for interesting book on Fertilizers—FREE.

GROW STRAWBERRIES

We WANT your order for STRAWBERRY PLANTS this coming season. Of course you are planting a larger acreage than usual,—everybody's doing it, for strawberry growing at the prices now days is a sure fire money maker. The Canning factories are anxious to buy all the berries they can secure, so we now have no fear of over production. Get our plants and be sure of big crops. Senator Dunlap, Warfield, Beder Wood and Dr. Burrell, six dollars a thousand. Sample, Glen Mary, Premier and Bubach seven dollars a thousand. We allow one dollar a thousand discount from these prices on all orders of four thousand or over of one variety. Send for Catalogue. It's Free.

CYRUS & MANNING ELLS, Port Williams, N. S.

you are heading back a branch, cut it off next to a lateral or side branch, making the cut parallel to the axis of the lateral. Wounds should be made smooth and clean-cut without undue injury to the bark or wood.

A protective paint should be used on all wounds an inch or more in diameter. For rthis purpose nothing is superior to white lead and raw linseed oil. To each quart of this paint add one ounce of ground corrosive sublimate as a disinfectant. If paint is not available, tar may be used, though there is some doubt whether trees are not injured by the application of tar to wounds. It is antiseptic and prevents checking and drying of the wood, but after all is said and done, a good coating of lead and oil is the safest and most conveniently applied dressing for wounds of fruit trees. To anyone who has observed the conditions in old orchards which have been neglected, the most obvious necessity is the removal of dead and diseased branches. After these come the interfering branches, or the ones that rub each other, and lastly the heading in and thinning out of other branches, in order to shape the tree. There is no danger of injuring the tree by taking out dead and diseased wood no matter how much is removed. Care in taking out live wood is necessary, however, in order to prevent excessive sprout growth in the remainder of the tree. It is best to take three years or longer to do a thorough job of pruning. The first year after clearing out the dead, diseased and interfering branches, it is well to confine the work to a small amount of heading back on the tallest branches and those which sweep the ground too much. A few of the limbs which are parallel to others very near by may be removed also. The following year more thorough pruning, with an aditional heading in of the higher and more spreading branches should be given in connection with thinning out to let the light down into the tree.

Save the Fruit Spurs

In your work see to it that none of the fruit spurs along the main branches are removed. Too many people in their enthusiasm strip the branches of all the fruit spurs and water sprouts alike, leaving long bare poles with a tuft of leaves and fruit bearing wood at one end. Remember the fruit is borne on fruit spurs, and the more there are along the main branches the greater will be the yield of easily harvested fruit. If fruit spurs are missing along these limbs it is a good idea to hear in part of the water sprouts instead of removing them entirely, and in this way encourage spur production.

Study each cut when you first begin work. Determine in your own mind how the removal of the branch will affect the appearance of the tree. At first the decision may be somewhat difficult, but as soon as you have gained a little experience the work will go much easier. Remember that a whole branch does not have to come out in a single season. Heading back each season for two or three years wil lremove the branches without excessive removal of wood at any time.

After all, the thing to which most thorough attention must be given, is how the work is done rather than just what is removed. Keeping the general notion of an ideal tree in mind and working toward that as an objective, making each cut carefully, saving all the fruit spurs and never leaving stubs, anyone can do a job of pruning that will add much to the results obtained from the orchard.—L. S. Goode.

COMPOSTS AS A SOURCE OF HUMUS AND NITROGEN

(Experimental Farms Note)

The examination of many types of soil—clays, silts and sands—virgin and cultivated, has furnished evidence of a very emphatic character regarding the fundamental and vital importance of semi-decomposed organic matter (humus) as a soil constituent. It acts mechanically in improving tilth, lightening and mellowing heavy clays and increasing the moisture-holding capacity of all classes of soils. It supoprts the microscopic life of the soil, the function of which is to phepare plant food for crop use. And, lastly, it is the natural storehouse of nitrogen—the most expennsive of all plant foods when purchased in the form of fertilizer. One of the chief objects in view in any intelligent, rational method of soil management is the upkeep and if possible the increase of the soils humus content. Applications of farm manures and the turning under of green crops—clover, buckwheat, rye, etc.—are the principal means of adding humus-forming materials to the soil, and these may be supplemented, cheaply and effectively by composts.

Every farm, every market garden, should have its compost heap, for such affords the most economical (and sanitary) means of utilizing the vegetable and animal refuse, indeed all forms of organic waste. To enumerate some of the materials that can be profitably used in this way; potato tops, cabbage leaves, waste straw, dead leaves, kitchen waste, old sods, the cleanings of ditches, road scrapings, muck and peat, pond and stream deposits; all these materials and many more rich in organic matter may by composting be converted into a forcing manure of very considerable value by reason of its humus content and its store of readily available plant food. In these days it behooves us to abandon our wasteful ways and utilize everything that may make the land more productive. The practice of burning all orangic refuse is an exceedingly wasteful one and should only be followed when, by reason of the presence of the eggs, spores and seeds of injurious insects and plants, the composted material would be likely to disseminate disease.

The making of the compost heap is a very simple affair. It can be built up of alternate layers, of say six inches, of refuse (including swamp muck if such is obtainable) and manure, to any convenient height, covering the whole with a few inches of good soil or muck. The heap should be kept moist, that decay may proceed, but not so wet as to cause drainage from the heap. The result, in a few weeks or several months, according to the season of the year, will be a manure of very considerable fertilizing value, capable of improving both clay and sandy loams and especially useful for vegetable and garden crops.—Frank T. Shutt, Dominion Chemist.

Whenever a limb of a tree is blown off or diseased, the stump should be sawn off evenly and painted with creosote or tar paint, otherwise decay will set in and spread to other parts of the tree.

The old threadbare axiom, "An ounce of prevention is worth a pound of cure," is as true today as it was the first day it was spoken.

Do You Know All About Spraying?

DO YOU know, for instance, that a crop of potatoes can be improved from a total loss to 400 bushels per acre, at a cost of $1. to $3.

Do you know that Mustard can be killed in the growing grain at 60 cents an acre?

That fruit crops can be improved 80 per cent?

That buildings can be whitewashed painted or fireproofed for half the former cost, and made sanitary and free from disease for practically nothing?

The Spramotor doubles and trebles the profits of users. We make many styles and sizes from $7. to $400.—a machine for every need.

In its 25 years on the market, the Spramotor has captured over 100 Gold Medals and First Awards, including the Canadian Government's spraying contest.

THE NEW BRUNSWICK FARMERS' AND DAIRYMEN'S ASSOCIATION IN ANNUAL CONVENTION

(Continued from page 450)

a body of united farmers, approach these problems, not with any sinister motive, but with that indomitable courage that has characterized the tillers of the soil through the late war struggle and made it possible for right to gain the ascendency over might.

C. F. ALWARD.

The committee to whom the address was referred with a view to bring the president's timely suggestions before the meeting for further action reported:

"We, your committee, beg leave to report that many of the points touched by the very able address of our president last evening, are being dealt with by various resolutions presented or yet to be presented. We recommend that the address be given the widest publicity, as representing the views of this convention in dealing with the many problems arising during the trying period of reconstruction.

REV. EUGENE de la GARDE,
T. R. GOGGIN,
M. A. REID,
J. R. TAYLOR.

Welcome to Fredericton

The city of Fredericton officially welcomed the delegates through their Mayor, His Worship J. A. Reid, who gave the delegates the freedom of the city and extended the felicitations of the urbanites and ruralites for a successful series of deliberation, as well as a cordial invitation to visit the industries carried on in the city. Pressure of convention business prevented the delegates from taking advantage of His Worships offer to convoy the delegates on their tour of inspection.

The reply to the address was made on behalf of the delegates by H. H. Smith, Treasurer of the Association, in the absence of J. E. De Grace, Vice-President, who was detained through illness.

The Resolutions

The following resolutions were regularly brought before the convention:

Whereas the lack of stock yards, abattoir and cold storage iacilities greatly retard the work of developing the live stock industry in the Maritime Provinces, and

Whereas the present long and expensive railway haul of livestock to the Montreal and Toronto abattoirs, coupled with the expensive railway haul of meat and meat products back to Canada's winter ports for export and for home consumption greatly enhance the high cost of living, which cost is liable to go higher, owing to proposed further increased freight rates, a matter which the consuming public can ill afford,

Therefore resolved that the New Brunswick Farmers' and Dairymen's Association in forty-fourth Annual Convention assembled at Fredericton, voicing the sentiments of over ten thousand New Brunswick farmers, this 17th day of March, 1920, hereby concur in the movement for the procuring these long felt needs for Maritime Canada, aCnada's only eastern winter ports.

Further resolved that the Dominion Live Stock Division be requested to take steps as will with the least possible delay provide for Maritime Province farmers and stock breeders the much needed stock yards and affiliated facilities.

Moved by A. E. Trites; seconded by R. M. Bynon. Carried unanimously.

* * *

Resolved that this convention of Farmers' and Dairymen's Association of New Brunswick submit to the Federal Department of Agriculture, the advantage of establishing an Experimental Station on the North shore of this Province. The nature of the soil and other local conditions are such, that a second Experimental Station, either in the Counties of Westmorland, Kent, Northrumberland, Gloucester or Restigouche, would be very beneficial to the agricultural interest of these respective counties.

In support of this resolution, it might be well to note that in the neighboring Province of Nova Scotia with a Central Experimental Farm at Nappan, a second Experimental Station has been established at Kentville, and the same applies to the other Provinces.

Moved by Phil Hebert; seconded Delphie C. Goguen.

* * *

Whereas there is a strong agitation in our cities advocating the adoption of "Daylight Saving Time," and

Whereas the change in time of our railroads and other public institutions is not only confusing, but is absolutely detrimental to the best interests of the farmer by interfering with the hours of labor and thereby curtailing production,

Be it resolved that we as farmers convened in this Farmers' and Dairymen's Association do emphatically protest against any change from the present Atlantic Standard time.

Moved by G. W. Smith; seconded by H. H. Smith.

* * *

Resolution Relative to Securing of an Egg-Laying Contest for New Brunswick

Whereas, egg-laying contests serve to create a keener interest in poultry production, and

Whereas, they promote the development of strains of higher egg producing capacity, and

Whereas, they provide the most reliable basis from which to judge the laying capacity of different strains, and

Whereas, they are a remarkable advertising medium for the poultry industry, and

Whereas, the record of New Brunswick pens in previous contests and those now in operation has been a credit to the breeders of the province, and

Whereas, New Brunswick is the only province in which a contest is not being conducted at the present time, and

Whereas, the Experimental Farms Branch of the Dominion Department of Agriculture has established a laying contest in every province, except New Brunswick, which has not already a provincial one in operation.

Be it therefore resolved and it is hereby resolved that,the Farmers and Dairymen's Association of New Brunswick in annual convention assembled, through the President and Executive Committee do take the matter up with the proper authorities with a view to obtaining a laying contest at the Experimental Farm, Fredericton, N. B. beginning Nov. 1st, 1920, and

Beit further resolved that a copy of this resolution be forwarded to the Minnister of Agriculture for Canada, the Deputy Minister of Agriculture, the Director of Dominion Experimental Farms, and the Dominion Poultry Husbandman.

Moved by G. E. Fisher; seconded by M. A. Reed.

* * *

Be it hereby resolved that the delegates to the New Brunswick Farmers' and Dairymen's Association in convention assembled hereby express their appreciation and approval of the efforts which have been made by the Provincial Dairy Department and the Representative of the Federal Dairy Division in stimulating and directing the development of the Daidy industry in this province. The delegates further express their belief that the encouragement of Central Co-operative Creameries is in the best interests of the Dairy industry and that legislation should be introduced dealing with the location of cheese factories and creameries and providing such regulations in reference to machinery and equipment as would enable the turning out of first class Dairy products.

Moved by Isaac Melanson; seconded by A. E. Trites.

Mr. President and Gentlemen:

We beg to present the following Resolution:

That whereas underdrainage in New Brunswick is not only essential but is vitally necessary to the productivity of some areas, and

That whereas, it is well known that surface or open drains are very inferior substitutes and will not render the land in as efficient condition for the productivity of crops, and

That whereas, the question of food supply is a vastly important one in our country today, and

That whereas, it has been clearly demonstrated that land systematically underdrained, will increase its production more than 100% in a very short time, and

That whereas, we, the farmers of New Brunswick do feel that the Government is not giving enough attention to this very important subject,,

Pure Air is as Necessary as Pure Food

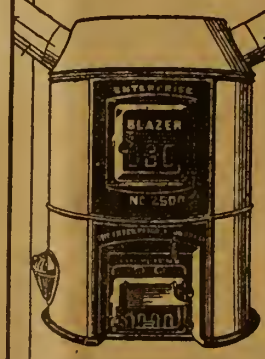
THE ENTERPRISE BLAZER FURNACE heats your home in Nature's way. It draws in the sweet pure air from the big outdoors, moistens it thoroughly, turns it into heat and comfort and passes it on to every corner of your home.

The best that base burners and radiators can do is to heat the air that is already in the house—that has been breathed again and again. Stoves choke the air with dust and in real cold weather they fall short of their job. Another reason for the

ENTERPRISE BLAZER WARM AIR FURNACE

is economy. For thirty-five years we have been learning how to take all the heat out of a piece of coal; and then how to make most use of it. The Enterprise Blazer is the result. And it costs a great deal less to install than a hot water boiler, pipes and radiators.

Health and Comfort →



An Enterprise Blazer will wear for years and years. Every part is made a little better than it need be, and it carries the famous Enterprise guarantee of satisfaction. Get your dealer's advice and write us today for our free booklet "Warmth and Comfort".

NEIL FERGUSON.

Therefore be it resolved, that we, the farmers of New Brunswick here assembled, do respectfully present this very important resolution with the request that it receive the attention that it so richly derserves, and

Further be it resolved, that some means be taken by the Department of Agriculture to procure clay tile to be distrubted through the Agricultural Societies.

R. Roy Raymond, Fred H. Walsh.

* * *

Resolution Relative to the Marketing of Poultry Undrawn with Heads and Feet On

Whereas, undrawn poultry passes through marketing channels (railway transit, storage, wholesale and retail stores) with less disease contamination and less leterioration than does drawn poultry; and

Whereas, Cold Storage Managers will not acecpt drawn poultry for storage purposes because it will not keep, and

Whereas, the flesh of undrawn poultry has a fresher and more wholesome taste than has drawn poultry, and

Whereas, the consuming public have no safeguard against the consumption of diseased birds when poultry is drawn and the heads and feet removed, and

Whereas, the markets of other provinces and of the United States are demanding poultry marketed undrawn, and

Whereas, so long as New Brunswick poultrymen have to market drawn poultry they can never hope for a market other than their local market,

Be it resolved and it is hereby resolved that the Farmers and Dairymen of New Brunswick in annual convention assembled do recommend that poultry be marketed undrawn with heads and feet attached,

And be it further resolved that a copy of this resolution be sent to each of the City Councils and to the leading newspapers of the Province.

Moved by Fred H. Walsh; seconded by J. R. Taylor.

* * *

Whereas, the need of the world today is such that it calls for greater production everywhere, and

Whereas, our Agricultural interests today are of paramount importance to the idividual, to the province and the nation, and

Whereas, the young men from our rural districts everywhere are leaving the farm for the city life, and

Whereas, there is no adequate textbook in our rural school calculated to turn our yoths' minds to agricultural pursuits and encourage them to stress scientific farming,

Therefore be it resolved, that we, the New Brunswick Farmers' and Dairymen's Association, convened at Fredericton, this 17th day of March, 1920, do request that a delegation be here appoited to wait upon the Government and urge upon them the necessity of immediately inserting in the curriculum of our country schools such a text book on Elementary Agriculture as shall enable the pupil at least by the time they have reached the fifth grade, to know what each of the various products or plants grown on the farm draws from the soil and also the need and value of the fertilizer required to make the growing of that plant a success.

Moved by Rev. R. M. Bynon; seconded by F. H. Walsh.

* * *

Whereas, the cost of all farm produce is considered by the city consumer to be too high, and

Whereas, the farmer is entitled to the current rate of pay for his labor,

Resolved, that this Farmers' and Dairymen's Convention here assembled, request the Provincial Government to appoint a commission to ascertain the actual cost of farm produce on the basis of an eight hour day, plus a reasonable profit. The report of the commission to be published in all local papers and also in pamphlet form.

Moved by T. A. Goggin; seconded by J. R. Taylor. Passed without discussion.

* * *

Moved by Rev. Eugene de la Garde, seconded by R. W. Melanson, that in future our Convention will not be held during St. Patrick's week. This resolution was amended to leave the matter of fixing dates for further conventions in the hands of the executive. Amendment carried.

* * *

Moved that the minutes of this Convention be sent to each secretary of Agricultural Socieies throughout the Province.

Moved by R. W. Melanson, seconded by A. J. Buttimer. Carried.

Entertainment

Musical numbers, readings and an exhibition of motion pictures, interspersed the Tuesday and Wednesday evening's programme. Among those who contributed this much appreciated innovation were Miss Hazen McCain, the efficient Superintendent of the New Brunswick Women's Institutes, A. C. Gorham, Superintendent of Elementary Agricultural Education and R. Bruce Flewelling, of the Soldier Civil Re-establishment Board, who, before going overseas, where he gained the distinction of having a German bullet shot through his body and bowels and recovered, was assistant horticulturist for the province of New Brunswick, gave several solos which were splendidly rendered and heartily encored. The readings by Miss Giberson of the Provincial Normal School staff and W. A. Walsh of Fredericton, received well merited applause and encore.

The motion picture scenes depicted beekeeping, instruction in live stock judging, sheep raising and the care and preparation of wool for market, as well as one or two comic reels.

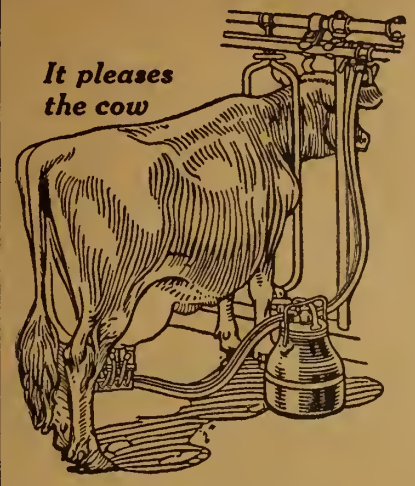
The Addresses

O. C. Hicks, instructor in Soils and Crops, New Brunswick Department of Agriculture, handled the subject of Clover Culture and Seed Selection in a clear, concise manner. He outlined the condition that must obtain in order to successfully grow a good clover crop.

Bee-keeping in New Brunswick, its Opportunities and Progress, by L. T. Floyd, the popular and efficient Provincial Apairist, aroused much interest. Mr. Floyd quoted facts and figures to show the splendid results that New Brunswick beekeepers are achieving. The progress during the past three seasons has been rapid and the total value of the bee industry from the honey standpoint alone, to say nothing of other economic conditions that are benefited by the busy bee, is well into the hundred thousand dollars.

In the absence of A. G. Turney, the provincial Horticulturist, who was detained in the country owing to conditions brought about by the recent storm, Mr. Geo. B. Danby, his assistant, gave an interesting talk on horticulture, dealing particularly with the question of the farmer's small orchard.

(Continued on page 461)



The DE LAVAL MILKER

The Milker You Have Hoped For

The De Laval Company now offers to dairymen a perfected and proved cow milker, worthy of the name DE LAVAL.

The De Laval Milker comes to your aid with the Company's full knowledge that you will expect more of the **De Laval** than of any other milker. For three years it has been in daily use on several thousand cows of various breeds, under all of the varying conditions to which a milker can be subjected.

The De Laval Milker is distinctly different, possessing many new and exclusive features that are of inestimable value to the careful dairyman and owner of valuable cows. Its action is positive and uniform from day to day, and it is faster, more reliable and more sanitary than any other method of milking.

An additional insurance of lasting satisfaction to users of the De Laval Milker lies in the De Laval Company's well-known facilities and reputation for service.

Write to nearest De Laval office for Milker Catalog, stating number of cows being milked

MONTREAL PETERBORO WINNIPEG VANCOUVER

LIVE STOCK.

My experience has been with farm animals that 90% of their ailments are due to digestive troubles. We rarely find any sickness when our stock is running on pasture. It is only when we stable them and select their rations for them that trouble is liable to occur, most of which we make for ourselves through faulty feeding or wrong treatment of their ailments. Colic in horses and indigestion in cattle takes on various forms. I do not think, however, that as many cases of colic now occur in horses as when boiling feed for them was more commonly practised. Boiled grain and potatoes fed for a short time may help to get the poor, run down horse in condition, but if continued for any length of time is liable to cause digestive troubles. Good hay, oats and a little bran is hard to improve upon, and for my own part I consider it worse than a waste of time to boil feed for any animals but hogs. Prevention is so very much better than cure in treating farm animals that we try to "not let it happen." It is most unprofitable to try to winter cattle on hay and straw alone, and for either a milking or fattening beef animal we must so balance the rations that it constitutes as nearly as possible the ingredients found in that best of all feed JUNE GRASS. We may best provide this by growing sufficient roots, (turnips. mangels or beets) corn, or other silage, to furnish the succulency found in grass, and furnish the protein deficient in these feeds by grain and meals.

However, even if we are not anxious to produce milk or beef, it will pay us to feed a regular root ration to whatever horned cattle we attempt to winter. This will not only better their condition, but guard against loss from digestive and other ailments, and after we have taken all precaution in our rations we must still be prepared for any indications of indigestion that may appear by having a full supply of medicines for their treatment always on hand. If a veterinary is within reasonable distance and we are doubtful about the diagnosis of a case we should send for him at once. It is foolish to risk the life of an animal and not fair to the surgeon to delay until we think we are going to lose the animal before calling for his services. I have great sympathy for any veterinary who is often called to treat a case at a time when the owner should be looking for a spade. Even then for fear of being considered neglectful or thriftless the full truth of the cause of the trouble is often not disclosed.

Every man in charge of live stock should train himself to be observing. A natural stockman will notice without purposely looking for it if each animal has cleaned up its feed properly and if its eye and muzzle are normal every time he passes them. These are indications that warn an experienced stockman of danger in time to take steps to avoid it. He will continually have on hand sufficient epsom salts for any emergency, spirits turpentine and sweet spirits of nitre, also stimulants of various kinds. Whenever a cow is noticed to refuse feed or to nose it over in a careless manner, he will give from one and a half to two pounds of salts with a little ginger, as a preventative, and feed lightly on soft feeds for a few days. If an animal is found bloated more or less with dry muzzle, and omitting a grunt with every breath, four to eight tablespoons spirits of turpentine should be given in a pint of raw oil, depending on the condition of bloating, along with the salts. While it is not easy to decide which of the four stomachs is involved, the treatment is practically the same.

My experience is, the first stomach, or paunch is more often affected than the others, and the manyplies or third stomach is the next most liable to get out of order. When excessive bloating occurs and great extension of the left side is met with, we must act quickly as gases develop rapidly in the first stomach and the animal is liable to suffocate and drop dead before any medicine can be administered. When this condition occurs and the animal shows great uneasiness, tapping should be resorted to, which consists in making an opening into the stomach and letting the gas escape. A trocar and canula is the instrument that is best suited for this operation, but as the stimach is attached to the skin mid-way between the point of the hip and first rib, a puncture in this location far enough from the muscles of the loins to prevent injury with any sharp instrument will answer the purpose. It is my experience that the first stomach of the cow is a very hardy organ, and will stand rough treatment, and while it is proper to disinfect any knife or instrument used for this purpose, I have performed it several times with any knife that happened to be handy when nothing better could be had soon enough with good results. However, we rarely have to resort to such severe treatment, but we should never leave a sick animal to see if they will come around of their own accord. Delay is very dangerous in impaction when digestion ceases and large quantities of food lodges in the digestive organs, and a condition of partial paralysis occurs, and our treatment is not only to at once administer a good large dose of purgative medicine, but to do everything we can to hasten digestion, which is best accomplished by warming the body, putting hot salt across the loins, and if cold water is before them, cover it so the animal cannot drink at will, but induce it to take all the water it will drink as warm as possible. In fact, do everything possible to warm up the stomach and follow up the purgative medicine with stimulating drenches. I have known most severe and unreasonable treatment to be given in cases of indigestion and impaction, giving the animal first heavy doses of salts, then following shortly after with still larger doses of various kinds of medicines and allowing the animal to chill its stomach by drinking cold water that might be within its reach, and if the animal survives (by reason of a vigorous constitution), in spite of such superstitious handling the treatment is heralded as a sure cuer for this complaint. After the bowels have moved the animal should not be allowed any solid food until it starts to chew its

cud, but at this time the owner is so anxious for recovery, and as the return of appetite is an indication of this he will often allow animals to eat enough to bring on a second attack and defeat all chances of recovery. Very limited quantities of soft feeds should be given for several days, such as bran mash, the best quality clover hay or a very few roots.

Few people can be made to realize how sensitive a cow's stomach may be after a severe attack of indigestion, and it is hard to get them to feed lightly enough for a sufficient length of time to allow a full recovery. Not only should we feed very lightly, but it is always better to give stimulants such as a teaspoonful of gentian three times a day, or one of the stock food preparations, which is about the only time we ever consider their use necessary. Always bear in mind that an animal that has passed through a severe attack of indigestion will be sensitive for a considerable length of time.

Every owner of cattle should keep the full supply of medicines I have mentioned continually on hand, and treat properly any animal showing signs of digestive derangement. It will not hurt them even if they are not sick or liable to be to administer a dose of epsom salts, and in many instances it may save us a lot of trouble or the life of a valuable animal. Of all things, learn to be observing and recognize any indications of approaching trouble. Prevention in this instance is many times better than cure.

W. M. LEA.

NOTABLE HERD OF AYRSHIRES AT COLDBROOK

The quarantine stables at Coldbrook are now sheltering the first shipment of Ayrshire cattle to be imported into Canada since the outbreak of the war and the stables have never housed at any time such fine stock as these forty-six representatives of the Ayrshire breed. They were imported direct from the Adam Montgomerie, Less Nessock stables in Ochiltree, Scotland, and made the passage to St. John in the steamer Cabotia, of the Donaldson line. Mr. Hunter, of Hunter Bros., stock breeders of Freeman (Ont.) who brought out the shipment, made the voyage with the cattle and is supervising their care through the period of quarantine which will terminate on March 18 or 20. The Canadian breeders have been eager to avail themselves of the opportunity to improve their stock through importations from Scotland once more and have been little if any deterred by the fact that the price of cattle, like that of most saleable articles, is very much greater than it was before the war. A very high figure is named as the value of these animals.

It is believed that the Cabotia brought the most valuable shipload of cattle that ever left Scotland and among the forty-six there are some of the highest priced animals that ever crossed the Atlantic. They have aroused much interest in the maritime provinces. Many breeders have visited the stables to view them and Burt R. Brown, of Little York (P.E.I.), and Dr. Cummings, of Truro Agricultural College, are negotiating with Mr. Hunter for the purchase of some of the animals. McIntyre Bros., of Sussex, made an early choice and have bought an exceptionally valuable pair, a bull and a cow, that will take a high place in the Ayrshire cattle of the maritime provinces.

The bull especially is descended from the very choicest strain of this breed in the world. He is named Lon Milton MacDonald. His dam is a wonderful young cow with a tremendous milk record. Her sire, Noonday Sun, is now champion of the breed in Japan. MacDonald's sire is the celebrated Casabianca for which a breeder recently offered $10,000 in Scotland. This bull has been sensational in his success as a sire. Thirty-two of his bull calves have already averaged $968 at public auction in Scotland and his full brother in January of last year sold, also at auction, for $7,400. Casabianca's dam holds the world's long distant milking record for her age of eight years. She has produced six of the greatest animals of the breed and milked in six consecutive years, 64,383 pounds of milk, testing 4.20 of butter fat. This wonderful cow has already returned to her owner in milk and stock $30,228. It will readily be recognized that McIntyre Bros. have secured a prize animal.

The cattle are wonderfully true to type and the Ayrshire breed perhaps demands more uniformity than any other. When the quarantine period expires it is Mr. Hunter's intention to take the cattle across the border. The next shipment of Ayrshire cattle from Scotland that is expected to reach St. John, will also come by the Cabotia, leaving Scotland on March 18. R. R. Ness, of Howick (Que.), will bring out a large shipment in that sailing. His animals will come from the Barrs stables.

MILK SUBSTITUTE IN CALF RATION

The imprtance of the dairy calf as an essential unit in the development of a profitable dairy herd is at last being accepted as an established truth. There are many barriers in the way of the man who grows calves. It is necessary that he be assured that when grown such a calf will possess hereditary qualities necessary for profitable milk yield, that it be free from disease, and that its cost be held within the bounds of his economic existence.

Nature designed a product to be used in growing calves, but man soon found that this product was necessary for his existence as well. The first step in the evolutionary process designed to make available dairy products for man and also to continue the growing of young cattle was the substitution of skim milk for calf feeding in the place of whole milk. Such a change merely denied the calf the butter fat of milk, but continued to provide all other elements of nutrition as nature had designed. Expert feeders found that good calves continued to be produced even though denied the element of fat.

As progress in our country continued, the use of milk became more insistent until today, in order to continue the growing of our dairy herds, the calves must be grown on a milk substitute to a greater degree. No doubt, as the time goes on the use of milk substitutes will become of greater importance in order to maintain our dairy herds.

Out of all of this has grown a great industry—the business of manufacturing milk substitute feeds for the growing of calves. The extent of this industry is unknown by many but as time goes on and the universal demand for milk substitute feeds becomes established the dairyman is going to find institutions who saw the shadows of coming events in time to prepare to serve them. The work of these institutions is to study the needs of the dairy calf and compound a ration upon which it will prosper. It has been found, as before stated, that fat is an unessential part of a ration for calves, providing its place is substituted by a digestible starch of carbohydrate in sufficient abundance to off-set the missing fat. It has also been found that the use of a carbohydrate for a fat has the advantage of being comparatively much easier to digest than a fat. Accordingly, in the most highly developed calf meals of today the use of fat is considered to be of secondary importance, the emphasis being placed upon a desirable form of protein and an abundant supply of soluble starch. High fat rations are difficult for all classes of animals to digest, even with man, although the best brains of the country advise a high protein ration especially with young, growing animals. So, in selecting a feed for young calves, judge the ration by its high protein, medium fat and high carbohydate declaration.—R. E. Caldwell.

The breeder of grade cattle who uses the best sires will breed more productive, higher selling cows than the breeder of pure-breds, or one who uses bulls of inferior breeding even though pure-bred.

Are you making a home for your children, or is it just a house?

The ownership of a respectable library is something which many look forward to, but few realize.

Penny Wise--Pound Foolish
Separator Buying

Many buyers of cream separators are tempted to save $10 or $15 in first cost by buying some "cheaper" machine than a De Laval.

In practically every case such buyers lose from 10 to 50 cents a day through the use of an inferior separator.

That means from $36.50 to $182.50 a year—and not only for the first year but for every year the separator continues in use.

Twice a day---Every Day in the Year

It should always be remembered that the cream separator saves or wastes in quantity and quality of product, and in time and labor, twice-a-day every day in the year.

Moreover, a De Laval Separator lasts twice as long on the average as other separators. There are De Laval farm separators now 28 years in use.

The best may not be cheapest in everything but it surely is in cream separators.

ord places the Renfrew
a perfect skimmer. It
fat.

The Renfrew is in Competition throughout the world with all foreign makes of separators. It has a large sale in the United States and is also to be found in the dairy sections of South America and in Europe.

When the Renfrew Separator is used no cream is lost through imperfect skimming. In an Experimental Farm Bulletin Mr. Barr, the Chief of the Dairy Division at Ottawa, says, "A good separator properly handled will deliver cream testing anywhere from 20 to 35 per cent. fat and not leave over .02 per cent. fat in the skim milk." The Renfrew Separator does better than that. On a test under ordinary farm conditions it leaves only .01 per cent. in the skimmed milk.

rew Cream Separator

Every part is made of the highest grade material, accurately manufactured and carefully fitted. Because of the patented Clutch which enables the gears of the separator to stop while the bowl is running down it should last one-third longer than an ordinary separator. This means that it is a 33⅓ *per cent. better investment* from the standpoint of durability and cost per year of service.

Interchangeable Capacity

The frame and driving mechanism is standard for all capacities, ranging from 350 lbs. to 1000 lbs., and made in weight and size for the largest capacity. When, by increased milk production, it is found that the capacity of your separator will have to be increased, all that is necessary is to send back the old bowl and bowl fittings for which an allowance will be made and deducted from the price of the new bowl and fittings of the size required to handle the larger capacity. Thus the Renfrew Separator will last a life time.

The working parts of the Renfrew are enclosed in a dustproof and oil tight frame casing. No dust or dirt can enter and all the gears run in a bath of oil. Oiling is only necessary four times a year. No oil can ever leak on the floor. Think what this means in cleanliness, easy running and longer life of the machine.

A Money Maker

The Renfrew requires little attention and time is money.

It needs oiling but once in four months.

No constant cleaning necessary of oil cups or places where oil leaks out.

The wide open bowl and smoothly polished steel discs are easily scalded and rinsed.

The anti-splash milk can prevents milk splashing out and is at a conveniently low height, only three feet from the floor. Women appreciate this as it makes it so much easier to lift milk into.

The driving crank is high to make it easy to drive and there is no stooping or backaches caused when running a Renfrew.

Write for catalogue of this All-Canadian Separator, and pamphlet showing Dairy School tests.

THE HORSE

START EARLY IN LIFE TO EDUCATE THE COLT

One lesson which has not been given very much consideration by Agricultural Colleges, and similar institutions that deal with live stock interests, has been the thorough domestication of farm animals. But there is nothing in all the industry that will give better results at less cost, than the early training of all farm animals. No other medium in the management of farm live stock will leave better profits for the outlay. To be successful with live stock, on the mixed farm thorough domestication and training must stand as the first important duty, for if confidence in their caretaker, and contentment with their lot is absent among the horses, cattle, sheep or pigs on the farm, there will be an absence of thrift in the management, and losses will be likely to occur. Every youngster is born with the instincts of the wild progenitor, and its organisms are not entirely fitted to the conditions of a life of domestication around the farm. Each species, therefore, require somewhat different training to fit in with the new environment.

It goes without saying that the spirit, the fire, the speed and the docility of the well bred horses is the result of the thorough domestication and training that the Arab gave the horse thousands of years before the Christian era. The docility and homing instinct of the sheep was generated in the species ages ago by the same race of people, who as shepherds "led" their flocks. "The sheep hear my voice and they follow me" is a biblical saying that throws a flood of light on the sucessful domestication of animals of remote times. It was the only way the Arab could make the best of the animal, and the only way the farmer can make the live stock industry worth while is to treat his animals humanely all the time; study their comfort in the varying climate, handle and train them in their nursery years; then the worries that afflict the average stockman will cease to exist.

Training the Colt

Every young colt that arrives at the farm should be halter-broken during the first week of its existence. This has been the experience of all good horsement after long practice and observation. They have found that firmness and kindness are two essentials in the work, coupled with a complete absence of fool's play and regularity in exercise that should only occupy a few moments each day. The colt will soon learn to love the diversion; but care should be taken not to weary it. The writer has never handled a colt yet but what neighed when it heard him around the barns. It was always ready to leave its mother in the stall to get its daily 60 seconds' period of exercise at being led with the halter rope.

Give the colt a short name, and always use it when speaking to it. Never strike it on the head, and be careful if ever striking it at all. It takes a long time to study the temperament of an animal to ascertain when punishment can be judiciously inflicted. At weaning time, the early training will stand it in good stead, for it will look on you as its foster-mother.

When the gasoline engine is going or the buzz saw in operation, quietly lead the colt out to convince it that nothing is amiss. Let it see the sights and accustom it to the smell of gasoline. Put a hand on it and reassure it that all is well and in order. Never push it from one side to the other in the stall, but train it to stand to the one side by the word of command. Never lift a pail of water up to its head to drink, or on a high manger, for the chances are that it may fall down or that its halter may get fixed in it, and the fright sustained may lead it to refuse to drink from a pail though thirsty. When taking it from the stall, always back the colt out, and turn it in the passage way. Many a colt has been permanently injured by attempting to turn around in a stall when alone in the stable. But a colt would never do this if it had not been accustomed to the careless method many horsemen have in allowing them to turn around in the stall when led out.

After the colt has gained sufficient strength and age to get advanced lessons, it may be harnessed and after it has become familiar with it and the bit in its mouth, the old cutter should take its place in the training. Never cheat the animal but instil confidence and give the colt the idea that so long as you are around it is all right. Kind and considerate treatment with constant attention to details, will lead to this.

MARES SHOULD HAVE SPECIAL SPRING CARE

To provide for successful foaling is of the utmost importance to the owner of brood mares. Successful foaling means starting a foal well on the way to add to the farm profit; it means that the dam will shortly be ready to resume her place in the farm work. Unsuccessful foaling may mean the loss of both mare and foal. Once in a great while the dam may be lost and the offspring saved. The loss of foal or mare or both is a serious financial set-back to the owner. The aggregate loss at foaling time is enormous. While there may be a number of causes, improper care preceding foaling and at that critical time is one of the principal causes. The mare needs simple care previous to foaling. The mares which foal in the pasture late in the spring after grass has started and after the nights have warmed usually suffer little loss. It is simply up to us on our more congested farms to furnish the mare with as nearly ideal conditions as possible, such as she would encounter on the summer range.

Feed, shelter exercise and cleanliness are the main factors with which we have to deal. The mare needs good feed to nourish the developing foal and to build up her own strength and flesh. No feeding calls for more skill than that of the mare through this period. The mare in vigorous condition can meet the rigors of foaling and will be a better mother. The most successful breeders are liberal feeders of their brood mares. They use judgment have them in good health and in solid flesh. A great many mares are eating too much hay, which is not only harmful to the mare but a wasteful practice. No hay or grain save of the very best quality should be used during this period.

(Continued on page 474)

Massey-Harris

Plowing with Power

The Massey-Harris Power-Lift Tractor Plow is the product of a rich experience of over half a Century of Plow Building. Its entire construction is especially rigid and strong to stand the immense strain of Tractor Plowing, and it is fitted with Bottoms specially designed for plowing with power.

Two Levers within easy reach of the operator on the Engine regulate the depth of plowing. By simply pulling a rope the Power Lift operates to raise or lower the Plow as desired. The Hitch has wide range of adjustment both vertical and lateral, and being stiff permits the Plow being backed. When raised all Bottoms are at the same level, the rear being equally as high as the front, namely, 6 inches. A Hardwood Break Pin in the Hitch prevents breakage. The Third Bottom or Plow can be detached to convert a Three-Furrow into a Two-Furrow, or vice versa; it can also be attached to a Two-Furrow, thus making a Three-Furrow Plow.

STANDING OR TRAVELLING THE STALLION IN SERVICE SEASON

The question of travelling a stallion, or standing him at home or a suitable centre, is one of great consequence to Cyldesdale breeding. The custom or practice of either travelling or standing is of vital importance to the two great issues in the industry, viz., the vitality of the stallion and the convenience of the farmer with a brood mare to patronize him. The stallion that is kept in the box-stall all winter without sufficient exercise and stands at home in summer waiting for the mares to come around, is liable to have his fertility impaired. There are very few of the average stallion owners that realize the amount of winter exercise that a stallion requires, in order to keep him in breeding trim. It is a mistaken idea to treat a stallion as if he were a fat steer, but many stallion owners treat their stud horse in a similar manner. Winter box-stall confinement of the stallion, as done by the average owner, is a distinct loss to the breed.

Travelling and Fertility

From the earliest times it has been observed that the generative system of an animal is markedly susceptible to any changes of existing conditions from that which maintained in vigor, the different species of farm animals in the wild state. Exercise played a more important part in their vitality for reproduction than feeding. The stallion therefore should be kept in as natural a condition as possible, neither too fat or too lean, with as much exercise as will keep him in a state of existence in which all the functions of the body are perfectly performed.

It is claimed in many cases that impotence in stallions is due to overfeed. This is only true in degree to the amount of exercise given. Like the mares they breed, they should be in the natural state. A stallion that comes out in the first of the season in a natural condition, and is settling the mares well, generally takes on flesh durng the season.

A good object lesson on the utility of giving the stallion plenty of exercise is very well illustrated in the general practice with owners of French Canadian horses. This class of horse is hardy, full of spirit and exceptionally fertile. There is no cuddling of stud horses in winter time with owners of this breed. The stud animal is taken to the lumbering shanties to do his share in the rough work there, and in summer time he is not idle when opportunity arises for his services on the farm field. There is no lack of foals where such practices exist, 90 to 95 per cent. of the mares generally prove in foal.

Standing at Centre Puts Industry on the Decline

In standing a stallion at a centre, there is apt to be generated a lack of interest in horse breeding. The stallion himself is not getting the chance for exercise nor does he get the advertising which he otherwise would do if travelled around the country. With the exception of a very few of the aristocratic stallions in the breed in Scotland that get mares sent to them for hundreds of miles, it is the custom there to travel all the stallions in the various districts. It is considered a point of excellence with the groom, in his fortnightly call, to arrive at the same time of the day at each succeeding call. It is recognized as the groom's business to call at each farm where the breeding mares are to be found. This is expected when the stallion is engaged. The farmer expects the stallion to make the usual calls at intervals of two weeks. It is not at all consistent to think that a busy farmer will give up seeding or haying or harvest to walk his mares a few miles to see if they are in season or not.

It does not take a great stretch of imagination to see how the practice of standing a stallion for service, at one or two centres, affects the horse breeding industry. To a stallion owner, whether it is an individual or a syndicate, the loss is all the same, both to them and the industry. By it, fewer are encouraged to get interested in the breeding operation, and consequently fewer brood mares to propogate and popularize the breed. It is the aggressive principle that is needed to increase interest in Cyldesdale breeding among the rank and file in farming communities, and the travelling stallion has all conditions in his favor.

Complaints are often made by stallion owners and importers that the service fee that farmers are willing to pay is not an adequate sum for the trouble and expense of rearing or buying the best animals. The regulation fee of $12 or $15 for every mare that proves in foal is not an arrangement to encourage the horse breeding industry. The high values that meantime rule for the class of Cyldesdales in Scotland that are worth importing calls for a higher fee, as well as the mare owner taking some of the risk of the mare not proving in foal. The customary fee for an avertage stallion in Scotland is $12 or $15 at service and $12 to $15 when the mare porves in foal.

The half fee paid on the last round at service is what is due to the stallion owner for the regular calls at the farm where the brood mares are kept. The other half is collected in the spring time when it becomes known that the mares are pregnant; the groom or owner making the round of the previous season. The intention to raise the fee to $25 for each mare proving in foal, that is advocated by stallion owners, is not at all an extravagant fee for a good horse, but the dividing it up in two payments is an arrangement that would encourage more mare owners to breed to the best horses, and encourage stallion owners to get a better class of animals. It is time for owners to get together and discuss the question of fees, mutually, so that the Cyldesdale industry may be kept progressive and the individual business of the horse breeding farmer may become more prosperous.

IMPERIAL HARNESS

IMPERIAL BRAND HARNESS is guaranteed free from all defects in workmanship and materials. You are certain of satisfaction when you buy a set of harness made by Trees & Company.

No. 640. Team Harness, is especially designed for farm work such as ploughing, seeding and general hauling. Exceptionally good value at a very low price. Blind Bridles with side check; lines one inch; high top hames; traces, steel chain, leather covered; pads with hook and terrets; backstrap with trace carriers riveted on top. White metal or japanned mounts, less collars. Price **$57.00**

Sold by the Harness Trade throughout the Dominion. If your dealer will not get Imperial Harness for you, write direct to us for Catalogue and prices.

SAMUEL TREES & CO., LIMITED. Established 1866.
Manufacturers of Harness and Dealers in Automobile Accessories.
42 WELLINGTON ST. EAST, TORONTO

You Can't Break This Hame Strap

"The Horsepower"

Made from Chrome tanned leather. Tanning is of special merit. A strap of unequalled strength and durability. It remains soft and pliable under all conditions. More than twice as strong as ordinary harness leather.

IMPORTANT—To make sure that you are getting all these qualities, do not fail to look for the name "Griffith" stamped on every strap. It is your guarantee of satisfaction.

Griffith

If your dealer doesn't sell the famous Griffith Chrome Leather Harness Specialties, send 35c for sample of 1 inch "Horsepower" Hame strap (40c in the West). For lumbering or very heavy teaming we recommend the 1¼" strap at 45 cents (50c in West).

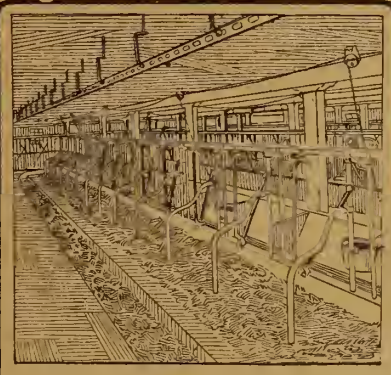
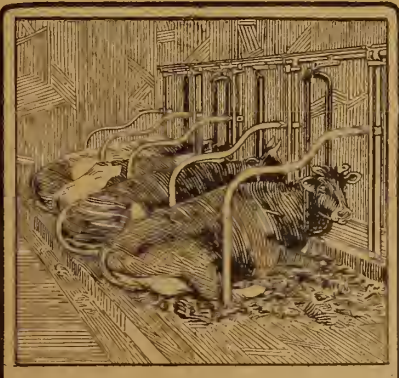
64 Waterloo Street, Stratford, Ontario.



1. BT Steel Stalls last for a lifetime and need no repairs. The first cost is the only cost. Lumber is expensive so it certainly pays to put in steel. Steel Equipment will make money for you from the day you install it. Wood Equipment is a source of expense.

2. Wood Stalls and floors are always needing repairs. Planks rot; nails pull loose; posts have to be renewed. Wood Stalls are a constant expense and a continual worry. Your stock never look as well in wood stalls as they do in bright, clean, steel stalls.



3. BT Steel Stalls stay right for the rest of your life. They always look well and your stock always look well in them. Send in the coupon below for the BT Barn Book. It shows many barns, remodelled by farmers who needed profitable, handsome stables. They obtained them by putting in steel.

Send this coupon for the 352-page Barn Book. Tells how to plain and built the barn, how to ventilate, how to frame, how to save steps, labor, time and feed. This book saves you hundreds of dollars in building.

THE NEW BRUNSWICK FARMERS AND DAIRYMEN IN ANNUAL CONVENTION

(Continued from page 459)

A. C. McCullough, Poultry Superintendent for the Provincial Government discussed the poultry situation, and outlined the work undertaken by his department during the past two seasons in bringing into the province eggs and chicks from high producing strains of Barred Rock poultry. The successes attained by New Brunswick competitors at the Prince Edward Island and Nappan Egg Laying Competitions in 1919 and this year, go to show that the right kind of stock and eggs have been introduced.

The questiin of Dairying and Co-operative Creameries was ably handled by A. E. Trites, president of the Farmer's Co-operative Creamery Company, Moncton. The success of the Farmer's Co-operative Creamery Company is well known to readers of the Maritime Farmer. The example is good and ventures of a similar nature in other parts of the province should prove equally successful. Mr. Trites has been untiring in his efforts to get the Farmer's Co-operative Creamery away to a good start, and must feel justly proud of its success.

H. W. Coleman, Dairy Superintendent, outlined dairy conditions as he has found them in this province. He told about the establishment of a Cheese Board at Sussex, and its operation. He also explained the aims and objects and success so far attained by the New Brunswick Dairymen's Association. A full account of whose convention appeared in these columns a few issues ago.

Bulls, their Care and Keep was the subject of an instructive and much needed talk by James Bremner, Agricultural Representative for the Uorthern counties.

Hon. J. F. Tweeddale, Minister for Agriculture, outlined the past, present and prospective policies of his department. Substantial progress looms up splendidly in every division, with the result that as never before, the rank and file of the farmers of the province are working hand in hand with the efficient leaders of the respective division of his department, to make for a bigger and better New Brunswick.

The Marketing of Eggs and Fowl was the subject of a paper prepared by G. R. Wilson, New Brunswick representative of the Dominion Poultry Division, who was unable to be present to read it himself, owing to illness. Readers of the Maritime Farmer, who have met Mr. Wilson in the discharge of his duties, and who are conversant with the good start made in the co-operative sale of poultry at Port Elgin last season, must know how much energy he puts into his work. We were pleased to note that Mr. Wilson was able to be present at the closing session of the Convention.

Hon. P. J. Veniot, Minister of Public Works, delivered a timely address on the subject of Roads. The number and nature of the questions asked by the audience, clearly showed the interest that the farmers take in this subject.

Co-operative buying was ably discussed by Mr. J. D. McKenna, Secretary of the Agricultural Societies United, and manager of The Maritime Farmer.

The co-operative purchase of fertilizing chemicals through the agency of the New Brunswick Agricultural Societies United, has saved and is saving the members of Agricultural Societies in New Brunswick many dollars on each ton of goods thus purchased, as is the co-operative purchase of seed and feeds through the agency of the Maritime Farmer.

Mr. McKenna clearly stated his attitude re farmers organizations. There should be no East and no West so far as this country is concerned—just one Canada. Farmers should organize, but in so doing there should be that freedom of thought and action that will preclude the possibility of one section prospering to the detriment of some other section.

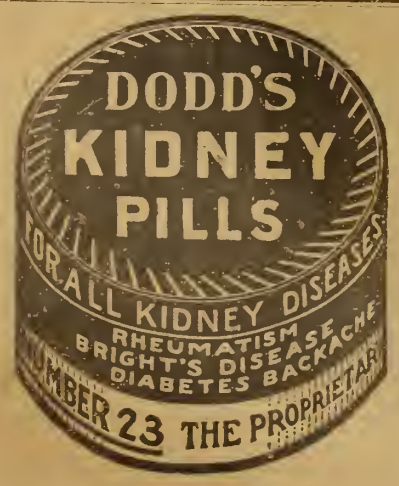
Mr. E. P. Bradt, Secretary for Agriculture, gave a talk on live stock conditions, dealing principally with the needs for Maritime Stock yards.

Geo. E. Sanders, of the Dominion Entomological Laboratory, Annapolis Royal, N. S., gave a talk on Potato Sprays and Spraying, in the course of which he demonstrated the proper method of making Bordeaux, using white arsenic as an insecticide. The reports of the various Agricultural Societies, showing the prevalence of potato blight and subsequent rot, is ample proof of the necessity for a strong potato spraying campaign during the coming summer.

Rev. R. A. Robinson, Stanley, N. B., spoke of the need and value of Community Social Centres. There is ample opportunity and need for much work along this line, and consequently the address was most timely. Better social conditions in a community will materially help to make for contentment and prosperity in a community.

The co-operative marketing of wool, lambs and other live stock was well handled by F. Waldo Walsh, Acting Live Stock Superintendent, and J. Kenneth King and Robert Donaldson, representatives of the Live Stock Division, Ottawa.

Mr. Walsh outlined the work of the Canadian Co-operative Wool Growers' Association, and the splendid results



Waterman's Ideal Fountain Pen

Do you ever write letters, orders, receipts, or instructions? Do you sign papers, make notes, write cheques? Do you keep accounts and records?

Then you are interested in the above features of the Waterman's IDEAL Fountain Pen, which help to put business methods into your writing.

(A) The iridium-tipped gold pen made in ten grades of points.

(B) The lever which fills or empties the pen—no unscrewing, or inky fingers.

(C) The Clip-Cap which holds your Waterman securely in your vest pocket.

Go to any good dealer and select the Waterman that is IDEAL for your hand.

$2.50 and up.

ST. JOHN FREDERICTON

achieved in the marketing of wool co-operatively by the farmers of New Brunswick.

Mr. King gave timely advice on the marketing of lambs. He strongly advocated the practice of docking the lambs and castrating the ram lambs intended for the market. The formation of co-operative shipping clubs was the best solution for the sale of lambs until such a time as Maritime Stock Yards are put into operation. When the stock yards are an accomplished fact, the clubs now being formed will divert their stock to the Maritime yards, and will be in shape to give such yards a line of trade right from the start.

Mr. Donaldson was for many years connected with the Nappan Experimental Farm, and is a practical stock man, whose services should be invaluable to the farmers of New Brunswick.

M. A. MacLeod, Superintendent of Agricultural Societies, gave a short report of his department and outlined the Federal Departments' proposed new policy re subventions for Field Crops Competitions in the province.

John Woods outlined the plan under which the Clover Huller is operated, and gave much valuable information on clover seed production.

On two afternoons between the hiurs of four and six o'colck, the meetings were turned over to the French speaking delegates, who listened attentively to splendid addresses in the French language by J. A. Ste. Marie, Ottawa, and Messrs. Barabois and Tardif of the Dominion Pathalogical Laboratory staff, Fredericton.

Delegates Visit Experimental Farm

The closing session of the Association was held at the Experimental Station, where lunch was served by Superintendent W. W. Hubbard and his staff.

Nearly two hundred farmers sat down to the well laden tables, and partook of the bountiful repast, after which Mr. Hubbard outlined the work that is being accomplished in building up the farm dairy herd by the use of pure bred sires.

E. M. Taylor, Assistant Superintendent, spoke on the subject of Lime in Agriculture, outlining the facts which had come to his notice as the result of investigations conducted by him on his father's farm, and later during his college career on several farms in other parts of Westmorland County. He also gave the results of his research work re the lime stone deposits in this province, and his survey of soils to determine conditions re acidity, while he was working under the auspices of the Provincial Department of Agriculture.

Prof. W. S. Blair, Superintendent of the Kentville Experimental Station, whose timely article on the subject of lime appeared in the last issue of The Maritime Farmer, and who has been getting such striking results through the use of ground lime, also spoke in support of Mr. Taylor's address.

In passing he referred to his pleasure at hearing Rev. Mr. Robinson's address the previous evening on Community Social centres. He strongly urged the farmers to carry Mr. Robinson's message to their respective communities, and put the suggestions therein contained into practice.

At the close of Mr. Blair's address, many of the delegates retired from the dining hall to wander at will through the stables and barns, to take note of the live stock, while a goodly number of interested potato growers remained to hear Mr. Geo. E. Sanders, who by request gave another interesting talk on Potato Spraying.

Votes of Thanks

An unanimous vote of thanks was tendered to the retiring president, to the various speakers who addressed the meetings, to the ladies who so kindly entertained by song and story, to the Superintendent of Agricultural Societies, M. A. MacLeod for his work among the Societies and at the Convention, and a standing vote in honor of Col. H. Montgomery Campbell, a past president of the Association, who was present after his return from doing his bit overseas.

A. E. Trites and J. D. McKenna placed themselves on record as being willing to go to Ottawa as a delegation, at their own expense, to further the wishes of the Association in respect to any movement requiring Federal attention.

Mr. Pratt of the Grain Grower's Guide gave a short address on the condition of the Western wheat markets, and the conditions that effect wheat prices.

C. Gordon Sharpe, Secretary of the United Farmers of New Brunswick, was introduced to the meeting by Mr. H. H. Smith, Treasurer of the Association. Mr. Sharpe evidently was present for the purpose of attempting to discredit Mr. J. D. McKenna and The Maritime Farmer.

He inferred that the big interests of Canada were attempting to offset the United Farmer Movement, and he had been told that a fund had been created for the purpose of buying advertising and editorial space in the press to further their own ends. He insinuated his belief that a portion of the funds in question were being used to influence the Maritime Farmer and Mr. McKenna.

This insinuation was hotly resented in the absence of Mr. McKenna by Rev. R. M. Bynon, who eulogized the good work that the Maritime Farmer and Mr. Kenna have done for the farmers of New Brunswick.

Mr. Bynon was cheered to the echo, which cheer gave Mr. Sharp an answer that he d'd not anticipate, and he shortly afterwards left the hall. Mr. H. H. Smith spoke in favor of Mr. Sharpe, and at this juncture the discussion was ruled out of order by the president.

The addresses of the various speakers at the convention will be published in future issues of the Maritime Farmer.

Officers for the Ensuing Year

The election of officers resulted as follows:—

President—H. H. Magee, Quispamiss.
Vice Pres.—A. J. Gaudet, St. Joseph.
2nd Vice Pres.—J. R. Taylor, Little Shemogue.
Corresponding Secretary—A. J. Doucett, Moncton.
Recording Secretary—K. M. Fisk, Florenceville.
Treasurer—F. H. Walsh, Coverdale.
County Vice Presidents—
Albert—Lewis Smith, Coverdale.
Charlotte—Wm. Hyslop, Moores Mills.
Carleton—H. M. Estey, Hartland.
Gloucester—J. C. Killoran, Belledune River.
Kent—E. A. Melanson.
Kings—W. E. Wallace, Penobsquis.
Madawaska—J. A. Bernier, Edmundston.
Northumberland—W. M. Johnston, Newcastle.
Restigouche—Harold Hayes, Nash's Creek.
Queens—Geo. W. Dingee, Gagetown.
St. John—J. M. Donovan, Coldbrook.
Sunbury—H. H. Smith, Hoyt Station.
Victoria—Jas. Clark, Kincardine.
York—E. J. M. Jarvis, Stanley.

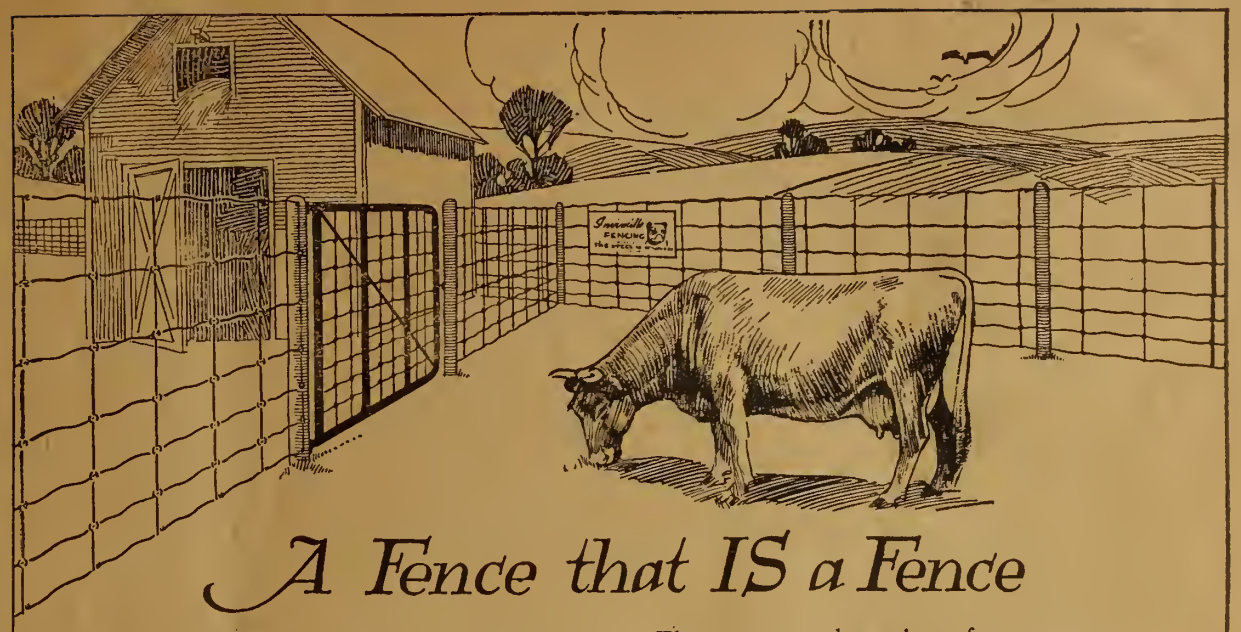
Local Parliamentary Committee

A. E. Trites, Salisbury; C. F. Alward, Havelock.

Federal Parliamentary Committee

A. E. Trites, C. F. Alward, J. D. McKenna, Sussex and Hon. J. F. Tweeddale, Fredericton.

The 1920 Convention is now over; it was a good one. Let all Society members work for a bigger and better Convention in 1921.



A Fence that IS a Fence

THE value of farm products today is high. The crops are deserving of proper protection. In the face of a world wide shortage of farm products you cannot afford to risk the loss of any of your crops. The success of your efforts to produce more is to a great extent dependent upon your fences.

Invincible Fencing

MADE FROM

OPEN HEARTH STEEL

Our advice to you is to buy good fence. Let your thoughts be quality, strength and durability. Invincible fencing made exclusively from high grade Open Hearth Steel and well galvanized, each operation from the ore to the finished product being made by men of long experience is your best investment today. This fence means an impregnable barrier on your farm.

Invincible fencing and gates are sold by the best class of dealers all over Canada. Catalogue upon request.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Shbjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N. B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

ACHIEVEMENT

Bravely and cheerfully face your task.
Nor cavil at the burden you must bear
Since it is yours alone. This place
May be the very spot wherein success
Awaits your readiness and earnest zeal.
The dark moments when the sun is hid
May be the crucial to test your strength.
One ne'er achieves greatness or desire
Who finds not obstacles to be o'ercome.

THE BIG HOUSE

Barney Hulton, twenty-six, well-tailored, fresh and vigorous, sat on the verandah railing and looked down at the girl in the low wicker chair. She was a pretty girl of the same type as himself, with cheeks almost as rosy as the wool of her gay sweater. Never had she looked more delightful than in the soft May twilight, and never had she been so happy, for she and Barney were to be married in two weeks.

"Father's as pleased with you as if he'd picked you out himself," Barney said. "He can't talk of anything else. For once in my life I have tickled him pink. And I'm glad of it. Good old boy, dad. By the way, guess what he is going to give you for a wedding present, Eloise? Your choice of a house and lot. How's that?"

Eloise clapped her hands.

"Oh, lovely!" Her eyes sparkled.

"I knew you'd be delighted," Barney went on. "When dad does a thing he does it up brown, I can tell you. He's going to show you two houses and let you take your pick. One of 'em's that little new bungalow he built last spring on Perch street——"

"Ohh!" Eloise's tone was rather flat. "That."

"And the other is the Waltham house on Pearl avenue."

"Barney!" Eloise sprang to her feet, excitedly. "The Waltham house! That perfectly wonderful old mansion with the grounds and fountain and trees. Do you really mean that your father is willing to give us that?"

"So he says." Barney's face fell. "But you wouldn't want it, of course, Eloise. Why it has sixteen rooms. What would we do with 'em?" He laughed. "We'd be lost completely in that great place."

"We needn't use any more of the rooms than we like," Eloise said. "Think of living in those grounds in the summer."

"Yes, and think of shoveling paths in wintner. I'd rather got my eye on the bungalow, Eloise. Its six rooms and a bath look mighty cozy to me."

"Six rooms and a bath!" Eloise made a backward gesture, shrugging her shoulders. "I've lived in a small house all my life, Barney. What I want is a big one. You leave it to me. I'll see that you're perfectly comfortable. Your father is a darling and he knows. Probably he's heard me say that I like big houses."

"Probably," sighed Barney.

Two weeks later Eloise was the prettiest bride of half a dozen years and Barney the happiest bridegroom. They went away for a month's honeymoon and in the meantime Barney's father saw that the Waltham place was put in order for their return. The great yard was shorn, the fountain cleaned out, the windows washed, the rooms were swept and aired. The old house which had stood empty for several years had taken on a look of being inhbited even before Eloise's charming presence claimed it.

Eloise was the happiest young wife under the sun. She was in love with the whole world, with Barney first, of course, then with herself, then with her father-in-law, whose generosiity had acquired for her the desire of her heart. Her parents were moderate, easy-going folks, who had never been able to accumluate property. They had lived up their money as fast as it was earned and had little more to show for it than Eloise herself, with her beauty, a rather superficial education and a love of pretty clothes which amounted to extravagance. Having lived in a small house all her life Eloise felt that to possess a whole dwelling the size of the Waltham house would leave nothing to be wished for. And the proudest moment of her life was that upon which she walked up to the impossible portal and saw Barney's nameplate on the door panel.

A few days in the big house convinced her that a maid was necessary so one was hired. Even yet a home was scarcely accomplished. It is true that a few rooms presented a livable appearance, but the rest of them stretched away empty and dreary. Barney said, laughing a little uneasily, that the house swallowed up furniture the way an alligator does flies. —"You'll find we'll need ten carloads to make a showing. You can't make a drawing room out of a morris chair, one table and a lamp." Eloise was rather provoked at Barney for saying that. She had curtains up to all the windows so that the whole house looked nice enough from the outside. And when callers came she took them into the reception room.

Before a month had passed Barney announced that with the extra work at the office he could'nt mow all of the lawn every week or train the roses, so Eloise had better hire a man for the job. Eloise was perfectly willing to hire. At home they had done every bit of work themselves and this seemed such an easy way of getting it done. Besides, it looked so well to have a man servant as well as a maid.

One thing she had not reckoned upon—that people who live in big houses have a great many demands made upon them that people who live in small houses know nothing about. While Barney's father had given the house, his gift ended there and Barney was expected to keep up all expenses. These expenses grew at every turn. Barney's salary was gone almost as soon as it was earned, and sooner presently. He tried his best to keep out of debt, but a party Eloise gave, got them behind and they never quite caught up. Barney began to look worried and to act cross. Eloise could not imagine what ailed him. She wondered if he were getting tired of her and began to fret and have secret little fits of crying.

Then one day young Mrs. Elder whose husband had inherited so much money that he scarcely knew what to do with it—this gay, stylish, empty-headed little social butterfly, who had been attracted to Eloise by reason of the big house, informed Eloise that she ought never to think of walking over town, that it was a simply killing distance, and that she should think Barney wolud get Eloise a car.

Now Eloise had been thinking that very thing herself, so she told Barney never dreaming that he who had thus far denied her nothing would deny her that. "Get a little car, Barney, dear. I don't ask for an expensive one. I'll learn to run it, and it will be so nice for me to whisk you back and forth from your work these fall days. Barney became crimson, incoherent and almost breathless with rage. A car! The idea, when he could not meet expenses as they were, do the best he could. He was in debt, a thing that had never before happened in his family. He would not stoop to borrow from his father or anyone lse. They'd have to pull up short. If the house was doing it, why, they'd leave the house, that was all there was about it. If she didn't know what they were up against it was time she found out. Then he lit his pipe and nearly ground off the end of the stem in his strong teeth, while Eloise flew to her room to cry her eyes out.

Thereafter she did try to retrench, but what can you do with a careless maid in the house? And Barney was on a perfect grouch. Eloise really did try to do her bit, but she failed and the knowledge nearly broke her heart.

One day Barney's father sought her.

"Now see here, Eloise," he said, "I've come to you with a proposition. I've got a chance to sell this house if you don't want it any longer at a good price. I'll trade you in the bungalow and that will leave you a tidy bank account besides, which shall be in your own name, mind. What say, little daughter-in-law?"

Eloise said nothing. She couldn't, but she threw her arms about the old man's neck and kissed him. Then she told him a good many things she hadn't dared tell Barney.

Some two months later, as she was sitting cozily with Barney one evening in the living room of the bungalow, Barney said:

"Great old schemer, dad, eh, Eloise? Quite a tryout he gave you—us, I should call it. Guess he thought we had to learn our lesson the hardest way. We learned it, all right, that's certain."

FRESH AIR AT HOME

In a house in which the air is rigidly excluded, a man's foes are surely those of his own household. Added to the exhalation from human bodies and the smell of dead-and-gone meals, there are also germs from past colds and sore throats, preserved and carefully guarded to prevent their escape. Look about among your friends who shut themselves up. Ninety-nine times out of a hundred you will find them irritable; they quarrel over trfles, they have headaches, colds go through the whole family with wonderful rapidity, the children fuss, meals go wrong and the entire household seems at cross purposes.

Do not imagine that your house is well aired if you simply change the air by opening a door or window. Every room that is occupied by day or night should have a constantly

a delicious COCOA CAKE try it yourself

½ cup butter, 1 cup sugar, 1½ cups flour, 1 teaspoon baking powder, 2 eggs, mix ½ teaspoon soda with ¾ cup sweet milk, mix 1½ teaspoons cocoa with 4 teaspoons hot water, 1 teaspoon vanilla, pinch of salt. Mix yolks, butter and sugar; add milk, soda, flour and salt; beaten whites of eggs last. Use a cocoa or colored icing for filling and cover cake with same.

numerous other delightful dishes are made by using COWAN'S COCOA

27 Notre Dame Street West, Montreal.

changing current of air, and unless there is a modern ventilating system some other means should be provided for admitting it. A simple and effective way of letting in a free current of air without chilling the room or its occupants is to hang a board a quarter of an inch thick and twelve inches wide, by means of screw eyes set in the upper edge, to two hooks inserted in the window casings so the bottom of the board fits in, exactly flush with the window sill. The board may be fastened on one side near the sill by a movable button and the whole painted to match the window frame. When the window is raised about ten inches a steady stream of pure air enters the room and there is no draft.

Never make the mistake of thinking that cold air is pure air, if you sleep in a room without heat. A tightly closed room will rob your blood of oxygen the same as a tightly closed warm one. Often persons whose bedrooms are small do not open their windows because they do not want to sleep in an icy wind. That, of course, would not be pleasant nor necessary. A blanket thrown over the back of two chairs and put near the window will serve as a windbreak; or tack some light weight cloth over a screen and put it in the window and you will have plenty of pure air circulating in the room without blowing directly on the bed. Although a cold room is the ideal sleeping place it is a waste if vitality to get into a cold bed and try to warm it with the heat from the body. Put a hot water bag or soapstone into the bed long enough before retiring to make the mattress and clothes warm. This is especially essential for children.

Second-hand air is far worse than a second-hand tooth brush, yet many persons who would be horrified at the latter are willing to inhale the air expelled from other people's lungs.

The importance of good ventilation where several people are sitting cannot be over emphasized. In providing air remember that if two gas jets are burning they are consuming as much good air as four persons; and one kerosene lamp consumes the same. A lamp left with the flame turned down adds very much to the impurity of the air because of imperfect combustion. If you use a gas droplight and will remove the tubing for a test you will readily see from the odor of gas which escapes how necessary it is to take it down frequently and air it.

Householders seldom know that their cellars are the storehouses from whence comes fifty per cent. of the air of the first flooor and thirty per cent. of that on the floor above. If they did there would not be so many dark and noisome places filled with refuse and mold, spiders, cobwebs and mice to say nothing of decayed vegetables and fruit. Vapors from all these combine to penetrate the whole house and add their poison to the air that is breathed by those living above them. Every cellar, even if kept free from dirt should be ventilated as well in winter as in summer. A musty smell shows that mold plants are growing and are awaiting to attack fruit and vegetables. Cold will not kill these destructive germs. There should be plenty of air let in the cellar every clear day. Moisture laden air entering condenses on the wall and pipes and soon makes it so damp that it is a menace to the house. All cellars should have dishes of unslaked lime in them; this takes up moisture with avidity. When the lime crumbles, losing entirely its crystalinne character, it has become slaked and will take up no more moisture. It should then be renewed.

Numerous ill effects result from the extremely dry air of many over heated houses. Furniture checks, cracks and falls to pieces, pianos lose their tune, house plants get brown and wither, skins become parched, throats become sore and voices become hoarse. The dry atmosphere acts as a stimulant to the nervous system. Sleep is restless and broken. The change from too dry air of the house to the moist air out of doors causes colds.

It is necessary for every housewife to know how to regulate the atmospheric moisture of the home. Although hygrometers which register the moisture of the air can be purchased, they are expensive and there are other ways of determining the moisture. A string which contracts or expands according to whether it is dry or wet, if hung by the window in the fall before the house is closed, will hang a certain length when saturated with the moisture in the outer air. This cord sould touch this mark at all times after the windows are closed and if it does not the housewife should supply the needed moisture. This can be done in several ways. If the house is heated by steam keep the stopcock open. If there is a hot air system put pans of water where the air of the furnace passes over them. In the case of hot water a pan should be placed on top of the radiator. When the house is heated by a stove, hang the wick like strips of cloth near the stove with the ends in a pail of water; these darw up the water and the airs absorbs it. Best of all is to keep a constant current of fresh air entering the house.

An important part of water ventilation is often overlooked, that of personal ventilation. Your clothes, your hair, your teeth, all play their part in fouling the air indoors by the odor which emanates from them when not properly cared for. Wollen clothing particularly absorbs and retains emanations form the body and when not in use should always be hung where they will get sun and air; never in a dark, stuffy closet. Remember that your closets need the air and should have the doors left open, if you do not want the air of other rooms vitated every time the closet door is opened.

And the Reason Was—

"Have you any more of those lovely tea biscuits?"

"You are just twenty minutes too late, Mrs. Thompson. When we opened this booth at two o'clock we had thirty dozen of them, all baked by Mrs. Irwin, if you please! And by half past three they were all sold."

"Oh! And I promised Harry I'd buy some."

"She certainly is a marvellous cook, isn't she? I got her recipe for tea biscuits, but I can't make them anything like hers."

"I wonder what magic Mrs. Irwin works to bake so beautifully?"

"Well, I never knew until to-day. She told me she uses

MINARD'S LINIMENT
King of Pain

The old reliable remedy for Rheumatism and Neuralgia, Sore Throat, Sprains, Strains, Swelling of any sort and Bruises

RELIEVED THE PAIN

Miss Ruth Tarkington, 12 Trafalgar St., St Thomas, Ont. "My grandmother was subject to rheumatism and used to call me from my playmates to go to the druggists to get Minard's Liniment. I was often unwilling and declared I hated that old stuff, but I soon found out how good it was. I got neuralgia. Grandma came with the Liniment and applied it to my head and I was very much surprised to feel how quickly it relieved the pain."

That Racking Persistent Cough

Should Never Be Neglected.

The constant hacking, racking, persistent cough that sticks to you in spite of everything you have done to get rid of it, means danger.

The longer the cough sticks, the more serious menace it becomes to your health.

It is a very easy matter to get rid of the cold at the outset by using

Dr. Wood's

Norway Pine Syrup.

In nearly every case it will allay the inflammation, soothe the irritation, heal the diseased mucous lining of the lungs and bronchial tubes, and thus rid the system of all the bad effects of the lingering cough or cold.

Dr. Wood's Norway Pine Syrup has been universally used for the past 30 years, and so great has been its success, it is only natural that a great many imitations have been placed on the market.

Don't accept any of these, so-called Pine Syrups. Get the original "Dr. Wood's."

Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

EGGS

Protein, 14.9 %; fat, 10.6%; Mineral Matter, 1%; Water, 73.5%.

Eggs, like milk form a typical food, inasmuch as they contain all the elements, in right proportion, necessary for the support of the body. Their highly concentrated, nutritive value renders it necessary to use them in combination with other foods rich in starch (bread, potatoes, etc.) In order that the stomach may have enough to act upon, a certain amount of bulk must be supplied.

A pound of eggs, 9, is equivalent to a pound of beef. Eggs being rich in protein, serves as a valuable substitute for meat. In most families, their use in the making of cake, custards, puddings, etc., renders them almost indispensible. It is surprising how many intelligent women, who look well to the ways of the kitchen, are satisfied to use what are termed "cooking eggs;" this shows poor judgment from an economical standpoint. Strictly fresh eggs should be used if obtainable. An egg, exposed to air, owing to the porous structure of the shell, has the water speedily evaporating from it; air rushes in, and consequently decomposition takes place.

White of egg contains albumen in its qurest form. Albumen coagulates at a temperatures of from 134 to 160 degrees F. Herein lies the importance of cooking eggs at a low temperature, thus rendering them easy of digestion. Eggs cooked in boiling water are tough and horny, difficult of digestion and should never be served.

When eggs come in from market they should be washed and put in a cool place.

Ways of determining freshness of eggs:

1.—Hold in front of candle flame in dark room. Centre should look clear.

2.—Place in basin of cold water and they should sink. Place large end to cheek and warmth should be felt.

Plain Omelet

4 eggs.
½ teaspoon salt.
4 tablespoons butter.
Few grains pepper.
1½ cups thin white sauce.

Separate yolks from whites. To the yolks add salt, pepper and hot water and beat until thisck and lemon colored. Beat whites until stiff and dry, cutting and folding them into the first mixture until they have taken up mixture. Heat omelet pan, and butter sides and bottom. Turn in mixture, spread evenly and place on range where it will cook evenly. When well "puffed" and delicately browned underneath, place pan on centre grate of oven to finish cooking the top. The omelet is firm when it has cooked enough. If it will cling to the finger when touched it will require longer cooking. Fold and turn on hot platter, and pour around it one and a half cups thin white sauce.

Milk is sometimes used in place of hot water, but hot water makes a more tender omlelet. A few grains baking powder is used by some cooks to make an omelet stay up.

To Hold and Turn an Omelet

Hold an omelet pan by handle in left hand, with a case knife make two one-half inch incisions opposite each other at right angles to handle. Place knife under the part of omelet nearest this handle, tip pan to nearly a vertical position by carefully coaxing the omelet with a knife, it will fold and turn without breaking.

Omelet with Meat or Vegetables

Mix and cook plain omelet. Fold in remnants of finely chopped cooked chopped chicken, hen, veal or ham. Remnants of fish baked may be added to the white sauce, or cooked peas, asparagus or cauliflower may be added.

Bread Omelet

4 eggs.
½ cup milk.
½ cup stale bread crumbs.
¾ teaspoon salt.
⅛ teasoon pepper.
1 tablespoon butter.

Soak bread crumbs in milk, add beaten yolks and seasonings, fold in whites. Cook and serve as plain omelet.

Boiled Eggs

Have ready a sauce pan containing boiling water. Carefully put in with a spoon the number of eggs desired, covering them with water. Remove sauce-pan to back of range, where water will not boil. Cook from 6 to 8 minutes if desired "soift boiled." Eggs may be cooked by placing in cold water and allowing water to heat gradually until the boiling point is reached, when they will be soft-boiled. In using hard boiled eggs in making other dishes, when taken from the hot water they should be plunged into cold water to prevent if possible the discoloration of the yolks. Eggs perfectly cooked should be placed and kept in water at a uniform temperature of 175° F.

Dropped Eggs (poached)

Have ready a shallow tin pan two-thirds full of boiling salted water, allowing one-half tablespoon salt to one quart of water. Put two or three buttered muffiin rings in the water. Break each egg separatel yinto a cup and carefully slip into a muffin ring. The water should cover the eggs. When there is a film over the eggs and the white is firm, carefully remove with a buttered skimmer to circular pieces of buttered toast, and let each person season his egg with butter, salt and pepper. If cooker for an invalid, garnish with four toast points and a bit of parsley. An egg-poacher may be used instead of muffin rings.

Eggs a la Suisse

4 eggs.
½ cup cream.
1 tablespoon butter.
2 tablespoons grated cheese.
Salt, pepper, cayenne.

Heat a small omelet pan, put in butter and when melted, add cream. Slip in the eggs one at a time, sprinkle with salt, pepper and a few grains of cayenne. Finish cooking and serve on buttered toast. Strain cream over the otast.

Scrambled Eggs

5 eggs.
½ cup milk.
2 tablespoonfuls butter.
½ teaspoonful salt.
1/3 teaspoonful pepper.

This Soldier Knows What Helped Him

DODD'S KIDNEY PILLS CLEANED OUT HIS RHEUMATISM

He Found in the Old Canadian Remedy Relief that the Hospitals of Egypt Could Not Give

Cape St. George, Nfld., March 28th. (Special)—Eugene Cornect, keeper of the light and fog alarm here and who was overseas with the Newfoundland forces is a firm believer in Dodd's Kidney Pills as a help for kidney disease and rheumatism.

"For two years I suffered from kidney disease and rheumatism," Mr. Cornect states. "I was treated for them in the hospitals in Egypt. But it was five boxes of Dodd's Kidney Pills that cured me."

Dodd's Kidney Pills are purely a kidney remedy. By putting the kidneys in shape to strain all the impurities of the blood they remove the uric acid, the cause of rheumatism. With the kidneys cleansing the blood there can be no uric acid to crystallize in the muscles and cause those excrutiating pains knowns as rheumatism. Ask your neighbors about Dodd's Kidney Pills.

GOLD DUST

Better Coffee?

How? Fresher Coffee Pot!

HERE'S a simple recipe that makes the "insides" of your coffee and tea pots absolutely pure and sweet:

Place a teaspoonful of Gold Dust in the pot, fill half full with cold water, let boil slowly for a few minutes. Pour out part of water and scrub with small brush. Rinse thoroughly.

This Gold Dust treatment *purifies* coffee and tea pots. That's why it helps to make your tea and coffee taste as they really should.

Don't wait till your package of Gold Dust is empty. Go get another package today. But be sure it really *is* Gold Dust you buy.

THE N.K. FAIRBANK COMPANY
LIMITED MONTREAL

MADE IN CANADA

Mr. J. A. McFarlane of Napanee, Ont., had chilblains so bad that he couldn't wear boots. Egyptian Liniment relieved them. Don't suffer from chilblains this winter. This liniment is also for Frost Bites, Burns Scalds, Cuts, Bruises, Sore Chest and Throat, Neuralgia, etc.

DOUGLAS' EGYPTIAN LINIMENT
AT ALL DEALERS 35¢ BOTTLE
DOUGLAS & CO MANUFACTURERS, NAPANEE, ONT

Beat omelet pan, put in butter and when melted, turn into the mixture. Cook until of a creamy consistency, stirring and scraping from bottom of pan.

Eggs a la Buckingham

Make 5 slices of milk toast and arrange on a platter. Use recipe for scrambled eggs, having the eggs slightly underdone. Pour eggs over toast and sprinkle with 4 tablespoons grated cheese. Put in oven to finish melting cheese and cooking eggs.

Buttered Eggs

Heat omelet. Put in one tablespoon butter when melted, slip in an egg, and cook until white is firm. Turn it over once while cooking. Add more butter as needed, using just enough to keep egg from sticking.

Fried Eggs

Fried eggs are cooked as buttered eggs, without being turned. In this case the eggs are cooked without being turned and the fat is poured over them in spoonfuls. Lard, pork, ham and bacon fat are usually employed —a considerable amount being used.

Eggs a la Goldenrod

3 hard boiled eggs.
1 tablespoon butter.
1 tablespoon flour.
1 cup milk.
½ teaspoon salt.
⅛ teaspoon pepper.
5 slices toast.
Parsley.

Make a thin white sauce with butter, flour, milk and seasonings.. Separate whites from yolks of eggs. Chop whites finely, and add them to the sauce. Force the yolks through a potato ricer or strainer, sprinkling over the top. Garnish with parsley and remaining toast, cut in points.

Scalloped Eggs

3 hard boiled eggs.
1 pint white sauce (as above.)
¾ cup cold meat.
¾ cup buttered cracker crumbs.

Chop eggs finely. Sprinkle bottom of buttered baking dish with crumbs, cover with one-half the eggs, eggs with sauce and sauce with meat, repeat. Cover with remaining crumbs. Place in oven on centre of grate and bake until crumbs are brown. Ham is the best meat to use for this dish. Chicken, veal or fish may be used.

Omelets

For omelets select large eggs, allowing one egg for each person, and one tablespoon liquid for each egg. Keep an omelet pan especially for omelets, and see that it is kept clean and smootoh. A frying pan may be used in place of omelet pan.

Recipes prepared by Fannie Mermit Farmer in "The Boston Cooking School Cook Book."

MACHINERY HAZARDS IN THE HOUSEHOLD

"Machinery in common use in the household presents serious hazards for the housewife, and particularly for children, when it is improperly constructed or when carelessly handled," declared the Bureau of Standards.

"Washing machines, ice cream freezers, churns, bread mixers and similar appliances which have gearings should have the gears inclosed so that fingers, hair and clothes are absolutely prevented from getting caught in them. Wringers, especially the motor-driven wringers attached to washing machines, should have a guard to prevent the fingers from entering between the rolls, and, moreover, should be equipped with a release device so that extreme pressure upon the rollers will throw them out of gear.

"Sewing machines should have a guard to prevent the fingers from sliding under the needle. Electric fans, of course, should invariably have a guard.

"Machines with sharp blades such as lawn mowers should be handled with great care. A lawn mower may easily cut off the fingers if turned while being cleaned. Young children should never have access to such machines as they do not comprehend the dangerous possibilities involved in playing with them."

REMEMBERING DATES

(From Farm and Home)

"If," said the teacher, "you rhyme the facts of history, it will help you remember them. For instance, 'In fourteen hundred and ninety-two Columbus sailed the ocean blue. That will help you to remember the date of the discovery of America."

Next day the teacher said, "Johnny, when did Columbus discover America?"

"In foutreen hundred ninety-three Columbus sailed the dark blue sea."

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. MARKETING OF GRAIN

Winnipeg, Man., March 2, 1920
The Editor,
The Maritime Farmer,
Sussex, N. B.
Dear Sir,—

Will you permit me space in your paper to reply to the leading editorial in your issue of February 3, entitled "A Narrow National Policy." I take the opportunity of making this request because of the misinformation upon which your editorial is based. I prefer to attribute the fallacious character of the article in question to misinformation rather than to a deliberate attempt to prejudice the minds of your readers in the Maritime provinces against their brethern in Ontario and tbe middle Western Provinces.

In the first place, the resolution adopted by the Canadian Council of Agriculture on January 5, and later approved by the annual conventions of the organized farmers in Manitoba, Saskatchewan and Alberta, to which you refer was as follows:

"WHEREAS the abnormal conditions of the war have rendered it necessary for the Governments of importing and exporting countries to exercise measures of control over shipments of foodstuffs, particularly wheat;

"AND WHEREAS, possibilities of continued governmental control over the grain markets of the principal importing countries of Europe, including Great Britain, still exist;

"THEREFORE BE IT RESOLVED that the Canadian Council of Agriculture, while not at this date declaring upon the principle of governmental control as a permanent policy, believe it is desirable to continue national marketing of Canada's wheat product, at least so long as the principal countries importing Canadian wheat retain governmental control of their imports and distribution."

That resolution has nothing whatever to do with the New National Policy which is the other name given to the Farmers' Platform, and in which there is absolutely no reference whatever to the problem of marketing Canada's wheat crop. Therefore, in all fairness I think you ought to correct the assumption upon which your editorial is based, that the foregoing resolution is part of the New National Policy.

In the second place, I should like to point out the mistaken character of your statements with regard to the resolution quoted above. The system of marketing Canada's wheat crop of 1919, is not the same system which was in existence during the war. Our wheat crop of the past season has been marketed under the control of the Canadian Wheat Board which was appointed by the Dominion Government in July last. During the crop seasons of 1917, 1918 and 1919, our crop was under the control of the Board of Grain Supervisors for Canada. Prior to 1917, the grain markets of Canada were open and uncontrolled by any Government agency, and it is worth noting here that in the spring of 1917, before the markets were controlled, wheat on the Winnipeg Exchange rose to the unprecedented price of $3.00 per bushel.

As you say in your editorial, "a guarantee of the price of wheat was a war measure and as such was accepted loyally by the farmers of the Maritime provinces." That was the condition which prevailed during the seasons 1917-18, and 1918-19. During the present crop season of 1919-20, in which the Canadian Wheat Board is marketing our wheat crop, there is not, however, a guaranteed or fixed price of wheat. In your editorial you assume that the condition which existed in the war years when the price of wheat was guaranteed, still continues. That is not so.

The only control of the marketing of our wheat that has been exercised this year is in the process of selling it. The Canadian Wheat Board was established simply for the purpose of disposing of Canada's wheat crop in 1919-20, in the best national interests. The price which the Wheat Board is able to get for our wheat is determined entirely by its value in the world markets. There has never been since September the 1st, 1919, a fixed or guaranteed price paid to the Western farmer or anybody else in return for wheat. The Canadian Wheat Board, however, advanced to the producer of wheat a minimum, initial price amounting to $2.15 a bushel on the basis of No. 1 Northern Fort William or Port Arthur, and at the same time gave to the farmer a participation certificate which entitled him at the end of the present season, which will be next August, to share in a "pool" made up of the amount which the Canadian Wheat Board might be able to secure in the markets of the world, over and above $2.15 per bushel. The domestic price of wheat to millers also controlled by the Canadian Wheat Board is supposed to represent the exportable value of our wheat and is also supposed to represent the actual price at which the Wheat Board is able to dispose of our crop abroad as well as at home. At the beginning of the present season the price of Western wheat to Canadian millers was $2.30 per bushel on a basis of No. 1 Fort William or Port Arthur. At the end of December, that price advanced to $2.80 per bushel, showing that the Canadian Wheat Board was being able to dispose of the Western crop on the markets of the world at a figure which was considerably in advance of that which prevailed at the beginning of the season. It was then, for the first time, that the Western farmer realized that his participation certificate would be worth considerably more than he had expected last fall when it was issued to him.

A CHANCE TO SECURE
HIGH CLASS HELP ON THE FARM

Imperial ex-service men who desire to take up land in Canada under the Soldier Settlement Act, must first gain experience on Canadian farms. Many of them have applied to the Board's officers in the British Isles. A number who possess outstanding qualifications (including men of considerable farm experience) have been selected and are ready to come to Canada as soon as places can be found for them on high-class farms.

Farmers who require the assistance of these Imperials should apply to the nearest office of the Soldier Settlement Board. They should indicate the length of time for which they can employ a man, the wages they are willing to pay and the conditions of service.

DISTRICT OFFICES At: Victoria, Vancouver and Veron, B. C.; Edmonton and Calgary Atla.; Regina, Saskatoon and Prince Albert, Sask.; Winnipeg Man., Torono, London, Fort William and Ottawa, Ont; Quebec and Sherbrooke, Quebec.; St.John,N.B.; Halifax, N. S.; Charlottetown, P. E. I.

The Soldier Settlement Board of Canada
W. J. BLACK, Chairman.

This explanation of the operations of the Canadian Wheat Board surely should correct the misrepresentation which your editorial conveys when it assumes that the price of wheat is fixed this year. True it is high, but it is high because the law of supply and demand have a chance to work naturally with regard to our wheat crop. Furthermore, because of the world's scarcity of wheat at the present moment, especially the hard wheat which is grown in Western Canada, the price under the operations of professional traders on open exchanges, such as existed in Winnipeg during the early part of 1917, would be manipulated to much higher levels than they are at present. This truth was evident last summer when for one week the Government permitted the Grain Exchanges to open. It will be remembered that on the Winnipeg Grain Exchange the price of wheat shot up 20 cents in a few days, and then the Government closed the markets again. Because the professional trading element in the grain business is eliminated in Canada, and is replaced by one efficient selling agency namely, the Canadian Wheat Board, the price of wheat represents more nearly than it could possibly represent under open market conditions, the true value of that commodity.

There is another reason why the task of disposing of our wheat crop during the past year should have been placed in the hands of such a selling agency as the Wheat Board, and that reason is because those countries which are the chief buyers of our wheat, all had their governmental purchasing commissions. With the buyers of our wheat organized in this way to purchase their supplies, Canada as well as the United States had no other alternative in the matter than to adopt similar organizations for purposes of selling. And all that the resolution which you wrongly credit as part of the New National Policy, asks for it that the present system of marketing Canada's wheat product should be conducted just so long as the principal countries importing our wheat retain governmental control of their buying.

Your several references to "an inflated price for wheat", "a fixed price", "a boosted wheat price", "a special preference," and "the Western crop disaster of 1918," are entirely without foundation. The watchword of our organized farmers of the West as well as of Ontario and your own province of New Brunswick (who have just applied for affiliation with the farmers of the West through the Canadian Council of Agriculture), is "special privileges to none," and this watchword has been lived up to consistently by our organizations for the past fifteen years.

Having in the conclusion of your editorial invited "an expression of opinion on this subject." I ask you respectfully to be good enough to publish this reply to your recent misstatements.

Yours truly,
NPL/F.

N. P. LAMBERT
Secretary, Canadian Council of Agriculture.

The above letter is the one which Mr. Gordon Sharp, of Pembroke, accused the Maritime Farmer of refusing to publish.

In this connection the following letter, addressed to the Canadian Council of Agriculture, 613 Boyd Building, Winnipeg, under date of March 11th, 1920. The letter speaks for itself. It shows that if Mr. Gordon Sharp's other statements to farmers are as accurate as those he made at Fredericton concerning this letter, they are not to be taken at face value. We will leave it to the hundreds of farmers who heard Sharp refer to the refusal of this paper to publish this letter, to designate Mr. Mr. Sharp's statment, each to his own satisfaction.

Our letter follows:

We have your letter of the 3rd inst., re article in the Maritime Farmer. We are publishing it in our issue of March 30.

We note the letter was registered. May we say that it was quite unnecessary for you to do so. The Maritime Farmer is a well known publication, and it has not yet reached the stage where it refuses to publish an article from a correspondent, provided that the article is in order. We thought that the registration suggested that the Maritime Farmer would try to dodge publication of the article. We can assure you that we do not publish that kind of a paper.

Not Just Good—The Best Roof

The tendency to-day is to use the best roofing material as a covering for all roof surfaces. This is not due to people having more money to spend, but to the realization that the first cost of a good roof is practically its only cost.

NEPONSET PAROID

provides a roof that is serviceable and long-lived. Lay a Paroid Roof today and forget it for the next twenty years or more. Before the roof needs repairs you will have spent far more than its original cost in repairs to other parts of the building. Hundreds of buildings throughout the Dominion of Canada conclusively bear out this statement.

The base of Neponset Paroid is a high-grade rag felt thoroughly impregnated with asphalt, making it positively waterproof, and fire-resisting.

It is further reinforced with a talc surface, grey in color; or with a permanent slate surface, red or green in color.

Roofed with Neponset Paroid you may rest assured that your buildings are perfectly weather-proof and sound.

Easy to lay—With every roll of Neponset Paroid is supplied sufficient nails and cement with full directions.

There is a Neponset dealer in your district. Write us for his name and a copy of our illustrated booklet "Roofing Canada."

NEPONSET ROOFS

FEDERAL ASSISTANCE TO HORSE BREEDING

Recently, certain Clubs whose members are the owners of a number of pure bred mares requested the Live Stock Branch, Dominion Department of Agriculture, to allow them to pay a premium over and above a Twenty-Five Dollar service fee, which is the maximum allowed under the Federal Assistance to Horse Breeding Policy. These Clubs expected by the offering of a premium to secure the services of the best stallions in the country.

In the hope that the pure bred stock of the country will be improved thereby the Branch has agreed to allow any Club that hires a stallion considered worth more than a Twenty-Five Dollar fee, and that passses a special inspection, to pay a premium to the owner.

Clubs have the option of giving the owner either a lump sum of money or to be paid at a time agreed upon, or a certain amount for each mare that proves to be in foal, the total to be paid on a certain date.

All stallions must possess size and be true to breed type. Draft stallions in particular must be up to weight when in ordinary breeding condition. Clubs interested should write the Horse Division of the Branch for an outline of the premium scheme and special Application and Agreement forms. All Clubs should note that the final date for receiving Applications is April 1st, next.—Live Stock Commissioner.

DISCUSSING THE MATTER

A farmer said to his negro servant:

"Jim, have you fed the horses?"
"Yassir."
"What did you feed 'em?"
"Hay."
"Did you feed the cows?'"
"Yassir."
"What did you feed 'em?"
"Hay."
"Did you feed the ducks?'"
"Yassir."
"What did you feed 'em?"
"Hay."
"Did they eat it?"
"Nowsir; dey didn't ezactly eat it so far as I saw, but they was talkin' about it when I lef'."

Fainting, Dizzy Spells

Weakness and Shortness of Breath.

Those feelings of faintness, those dizzy spells and "all gone" sinking sensations which come on from time to time indicate a weakened condition of the heart and disordered state of the nerves.

Milburn's Heart and Nerve Pills have no equal for strengthening the heart and invigorating the nerves.

Mrs. C. A. S. Drake, Paris, Ont., writes:—"I have used on towards the second box of Milburn's Heart and Nerve Pills and find they have done me good. I had those fainting, dizzy spells once in a while, and also weakness and shortness of breath, and would become so choked up at times I could hardly sleep without sitting up in bed. When walking too fast I would have to stop and try to catch my breath. I feel a lot better since I have used your pills and know that they have helped me wonderfully as I have improved very much."

Price 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

DR. ROBERT'S TOUR

(Continued from page 455)

tor of food supplies and as Canada's Agricultural representative at the Peace Conference, he has had better opportunity to know the real situation than any other single man in Canada. Farmers will do well to accept his forecast and produce to the limit.

CO-OPERATIVE NOTES

Mill feeds are scarce—very scarce. We can supply straight cars of splendid feeds and oats at reasonable prices. Prices, of course are high, but we offer feeds at wholesale prices to farm organization. We have available, subject to previous sale, 50 tons of cotton seed meal, 43 per cent protein.

About your auto tires. These recently advanced 20 per cent. We have a supply of small car tires and tubes at the old prices. They are offered, while they last. So get your order in and get it in quickly.

We will buy your dairy butter and strictly fresh eggs this spring and summer. We are prepared to pay cash and give you a price f. o. b. St. John. Eggs will be subject to candle test and we want only first-class stock. We want nothing but good butter, too. Watch the next issue of the Maritime Farmer for particulars.

If there is anything we can do for you—a reader of the Maritime Farmer, write us. We have saved thousands of dollars for farmers in all parts of the Maritime Provinces. You want to get the co-operative habit—the real co-operative habit. Write Maritime Farmer, Co-operative Department.

A Beautiful Complexion

reflects good health and pure blood. If the complexion is not clear—if it is blotched or pimply, use

Dr. Wilson's HERBINE BITTERS

the true blood purifier. Regulates the system, purifies the blood, and brings the bloom of health to pale and sallow faces.

At your store—35c. and $1.00.

ST JOHN N B. 49

MARE SHOULD HAVE SPECIAL SPRING CARE

(Continued from page 464)

The mare needs protein. Alfalfa, clover, bran and oilmeal contain protein and may be fed with excellent results. The mare which has been working and which is left off the team ten days or two weeks before foaling should have her feed greatly reduced. She does not need the large amount of grain that she ate and assimilated while at work. Overfeeding during those few days has injured thousands of mares every spring and has added to the loss of foals. Many good horsemen cut the grain in half when the mare is left to rest. Good judgment must be the guide, as a mare in thin condition can stand more feed and actually needs more than a mare already in high flesh.

Brood mares may be given too much shelter as well as too little, and harmful results come from both conditions. Most farm mares are used to being stabled at night. The care need not be changed greatly in most cases. It is well to see that the mare is kept in a clean place and that she has plenty of fresh air. A boxstall may be an absolute necessity at foaling time, yet when we put a mare into it from the tiestall, where there is a free circulation of air, or from the outside, where she has been sheltered behind a haystack there is a serious probability that the box will be so warm as to be harmful. The box-stall for the mare should have windows for ventilation and sunlight.

The brood mare needs exercise.

During the few days preceding foaling a good horseman will furnish mares with a paddock in which they may exercise at will. Exercise keeps the mare in good thrift and her muscular system hard and vigorous.

It is most essential to prevent injuries. An accident may cause the loss of the foal and may injure the mare permanently. Chief among the causes of injury is the mean, crabbed, old mare which fights the others away from the water trough or kicks them out of an open shed. The shed open on one side or with one or two doors is ideal for some live stock but certainly it is not adapted to sheltering brood mares.. Crowding the mares through gates or forcing them to cross icy ponds frequently leads to serious injuries. Once in a while a dog chases a mare, causing an accident of some sort. Improper team work is another cause of accidents. As foaling time approaches the mare should have light work and short hours and and should do little or no backing. She had best be placed in the hands of the most careful driver.

The mare should be accustomed to her boxstall before the day of foaling arrives. If she has been living in that stall for one or two weeks it will be all the better. She should learn to know the man who is to care for her and he should have gained her confidence. The mare that comes up to foaling time in a vigorous, properly-fed condition is the on likely to foal safely, if given the proper opportunity in a clean place.

It made a Success out of a Failure

Three years of crop failure—droughts which caused the loss of hundreds of trees—rains that rotted the roots of the young trees—and then Charles Sheppard discovered the advantages of planting with stumping powder. Today his 30-acre apple orchard is a money-maker.

C.X.L. Stumping Powder

will make your orchard a profit producer, if you do as Mr. Sheppard did—blow out the dead trees with C.X.L. and dig your holes for new trees by the same means. In the first five years their growth is nearly double those of spade-planted trees.

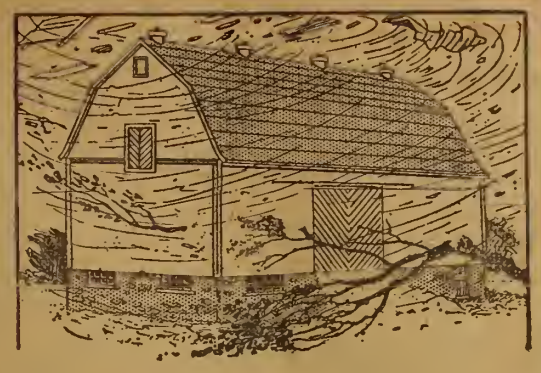
RAINPROOF

SNOWPROOF



WINDPROOF

The Economy of an Asphalt roof

The cost price of the roofing material is not the real cost of any roof. There is also the cost of laying and the cost of the repairs it needs from time to time. The sum total of all of these is the real cost.

While you may pay less per square for some other roofing material than you would for Brantford Asphalt Roofing the cheaper roofing will cost you far more in the end.

Brantford Asphalt Roofing

is not made to sell at a price to meet competition. It is made of the most enduring materials procurable, and made most carefully, too.

The body of Brantford Asphalt Roofing is a specially woven felt of exceptional pliability and durability. It is also very absorbent, so that it will take a heavy asphalt saturation.

A special blend of asphalts is used for the saturation and coating. By blending hard, brittle asphalts with soft, pliable ones we get an asphalt with remarkable elasticity — a tougher and more durable material.

Any good grade of asphalt is a very enduring material but our blend of asphalts is exceedingly lasting, and it puts Brantford Asphalt Roofing in a class by itself as an economical investment.

It is non-absorbent, therefore proof against rain and snow—and there are no exposed edges or places where the wind can get under and loosen or lift off the roofing.

The cost of Brantford Asphalt Roofing and the cost of laying it is the total cost of this roofing. It requires no repairs. It is a permanent roof.

If you could go through the factory and see this roofing made, you would be convinced of its splendid quality. But it has already proved this by its record of many years of service on roofs and still practically as sound as ever.

Brantford Asphalt Roofing is the real economy roof,—the roof that is made on a small margin of profit. By enlarging our output and installing the most up-to-date labor-saving machinery we have reduced the cost of production and thereby offset to a large extent the increased cost of raw materials. Quantity production has helped us to keep prices down, and at the same time maintain quality at its highest level. This company is building for the future and is maintaining its old policy of keeping up the high standard of its products and offering them at fair and square prices.

Brantford Asphalt Roofing is easily handled and quickly laid, saving time and cost of labor.

If you have a barn, silo, chicken house, root house or other building that needs re-roofing, or if you are going to put up any new building this year you will be interested in reading our latest roofing catalog.

Write for a copy. It is free.

INCREASING CONSUMPTION OF EGGS AT HOME AND ABROAD

(Continued from page 453)

Then again, when not only each centre but often each firm in each centre has a system or style of grading peculiar to itself, it is not surprising that the retailer or consumer becomes confused as to grades. Two firms may be using the same grade terms but that is no assurance that the eggs purchased from one firm are of the same quality as those purchased from another.

The question of increased consumption is a proposition bigger than any firm or individual. It is national in its scope. What is needed is something national in its application; in other words, a national gradation and terminology for grades of eggs that will have the united support of the business acumen and advertising genius of all distributors of eggs.

Canadian eggs are standardized but the grades have not been adopted for domestic trading. Much publicity has been given to these grades, but without the support of the trade in making them effective, the significance of the grade names and what they stand for has not been brought home to the consumer in a realistic manner. Individual firms could still use their own firm brands of eggs but they should be applied to the grades rather than to eggs as a whole. For instance there might he the "Rose" brand of "Specials" and the "Banner" brand of "Extras," and so on. That would still retain and promote individual firm efficiency. At the same time, it is contended that in order to promote nation-wide increased consumption, special significance should be given to recognized national grades upon which advertising matter could be based for the whole country so that when a consumer saw the word "Extras" on a carton or an a case there would at once spring to his mind a visualized picture of the quality of eggs in that case. In other words, provide for the home consumer something of the same system of standardization, grading and marketing that is in vogue for the export trade today.

Increasing Consumption Abroad

The reputation of Canadian eggs on the British market has been greatly enhanced during the past year. Last spring, the story of Canada's potential productiveness, her standardized product, her system of inspection was told in person to practically every importer in Great Britain.

Canada's system of inspection for export is based upon inspection by words "Canadian Eggs". and the Maple Leaf constitute a national guarantee of quality. The result has been that Canada not only sold every exportable egg available but sold at such a price that she was enabled to do what Holland and Germany did before the war, namely, import foreign eggs for home consumption and sell their own for export. As a matter of fact, only those who have had actual experience in exporting both States and Canadian eggs this past year realize to the fullest, what a boon to Canada Government inspection has been.

Canada has a distinct asset and great selling argument in her system of inspection for eggs for export. The British importer appreciates the general significance of this and it gives him confidence in buying. but as yet he does not fully understand the difference between grades. The domestic trade of Great Britain has been built up on brands and in pre-war days brands were legion on Tooley St. at the London Egg Exchange.

Denmark was the first country to place national grades of eggs on an export market. This was first done by the Co-operatives and later by the whole trade. As a result, Danish eggs are not seen on Tooley St. as much as formerly. They have found a more direct outlet to the egg merchants of London and the Provincial towns. Danish exporters still use brands but they are brands of grades not of eggs. Retailers and consumers have come to appreciate the significance of these grades, with the result that Danish eggs are the highest priced eggs on the British market.

So far, Canadian exporters have not paid sufficient attention to the shipment of the higher grades. The grade "First' represents eggs of only ordinary quality. "Firsts" are not a grade upon which to build an individual or national reputation.

"Extras" have been the highest grade shipped in quantity. Two or three small lots of "Specials" have gone across. Canadian "Specials" have, in at least one instance, made the top of the market in London. Certain parts of Canada are more favorably located to ship "Specials" than others. At least one large co-operative association has signified their intention of shipping "Specials" this year, but having in mind the close proximity of the Maritime Provinces to England, and the possibilities of rapid transportation between Halifax and Liverpool, there is no reason why with proper enterprise and business management, the Maritime Provinces as a whole, and even Ontario and Quebec via the North Atlantic route should not place on the British market a quantity of eggs commensurate with the best that is today supplied by Denmark and Ireland.

Importance of Advertising

Only the thin edge of the wedge has been inserted into the possibilities of advertising the Canadian product. It is easy to advertise Canada in Great Britain at the present time. The name "Canada" stands high in the esteem of the British people, and anything, backed by quality, is in brisk demand. Canada seems actually closer, nearer in actual distance, to Britain than ever before. Canadians should capitalize every opportunity to establish a place for Canadian products at the present time.

Canada has achieved a distinct national accomplishment in the marketing of her eggs and the slogan should be not only "Eat More Eggs" but "Eat More Canadian Eggs." British newspapers welcome notes about Canada. Backed by judicious advertising, the story of Canada's adaptability for poultry-keeping, her potential productiveness, and the story of the Canadian egg on the British market can be told and appreciated in every British home. The moving picture houses can be induced to help, and nothing would be more effective than pictorial representation of the value of eggs as food and what Canada is doing in an endeavor to conserve quality and supply Britain with a guaranteed article. The Government offices will help. A complete exhibit of Canadian eggs graded in accordance with the standards correlated material is now being shown in the principal centres. The following is an extract from a letter just received from the Superintendent of Emigration in Great Britain:

> "The exhibit of Canadian eggs which is being shown in our various agencie sis attracting a good deal of attention. Our agents are frequently asked for information as to the wholesale price of Canadian eggs, where they can be obtained, the breed of hens and other matters relating to poultry raising in Canada."

The Canadian Railway offices will help. To popularize Canadian products in England is good tactics for Canada, it means bigger business and more immigration of the best kind. To be successful, the work needs coordination, endorsation and support. It needs executive direction and representation in England and national

and individual effort should be synchronized.

Increased Consumption International In Its Scope

The increasing of egg consumption is a propisition bigger than any one nation; it is international in its scope. It is to Canada's interest that her competitors eat an increasingly large proportion of their own eggs at home. The peculiar growth-promoting, disease-resisting elements in eggs are just as important to the South American as to the European, and experienced travellers state that the solution of the Chinese egg menace is the making of industrial conditions in China such that the Chinaman can afford to keep his eggs at home.

Increased consumption was one of the chief topics of discussion at the International Poultry Convention held in London in March last and on a resolution from the Convention the different governments were asked to name delegates to a committee to consider the question of International Standards for eggs as a basis for increased consumption. This committee, representing fifteen different countries, met in London in September last, carefully reviewed the whole situation, discussed tentative standards and viewed eggs graded in accordance with existing standards. The committee will make its final report at the World's Poultry Congress to be held at the Hague, Holland, in August, 1921. During these deliberations, Canada's standards for eggs really formed the basis of the discussions, based as they were upon quality, edibility and science, the display of Canadian eggs graded in accordance with these standards was carefully analysed and favorably commented upon by all.

Conclusion

Canada has stepped into a prominent place in the world's activities in eggs. It is fitting that she should take the lead in the world's campaign for increased consumption, and with this end in view it is recommended that the Canadian Produce Association name a committee to collaborate with Government Departments on the matter.

This committee should be representative of all interests in the industry because **Increased Consumption** is bound to be the biggest and most vital thing affecting the whole industry. **Increased Consumption** includes a consideration of bigger and better business methods. It also includes increased production, conservation of quality, quality payment, legislation. It includes everything leading up to **"A Satisfied, Delighted, Persistent Consumer"**—a nation's biggest business asset at home and abroad.

SLIP KNOT FOR HALTER ROPE

Now what would happen if there were a fire in the barn and one wanted the horse out in a hurry, or if he hapened to get tangled up in the rope some way? These things all happen, as every farmer knows. With a hard knot there would be a long wait before getting the rope untied. Of course, if the man hapepned to have a knife in his pocket he could cut the rope, yet, how often do we farmers have a knife in our pocket all the time?

The knot that can be quickly unloosened ends with a loop just where the end of the rope would be pulled entnirely through if it were to be a hard knot. Then the end of the rope is slipped through the loop. Pull the end of the rope out of the loop and the horse is untied. That is easy and it doesn't take one second longer to tie that knot than the other. Get into the habit of tying horses to the manger in this manner, and it will come natural to the hand, and may save the life of a valuable animal some day.

These Tires Will Suit Your Loads and Your Roads

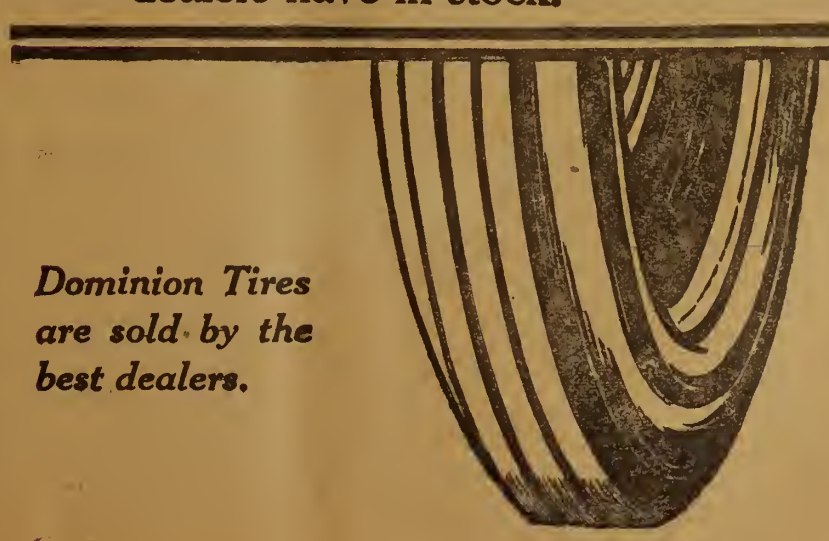
On farm and ranch and country road—on heavy hauls to town—on pleasure bent when work is done—DOMINION TIRES will give you long and satisfactory service.

DOMINION TIRES

ARE GOOD TIRES

Among experienced motorists, they are known as "greater" tires—because they give greater service, greater mileage, greater pleasure in riding.

DOMINION INNER TUBES mean perfectly balanced tires. Carry an extra inner tube in the car, as well as a supply of DOMINION TIRE ACCESSORIES — which all Dominion Tire dealers have in stock.



Dominion Tires are sold by the best dealers.

Stallion Catalon For Sale

I offer for sale my carriage stallion CATALON, 57741, foaled in 1904.

CATALON is a handsome 15-3 hands, 1075 lbs. mahogany bay of perfect conformation and sound. He had trotted a trial mile in 2.14¼, last ¼ in 32 seconds. Perfectly clever and kind. He is sired by Bingen 29567, record 2.06¼. Catalon's dam was the great race mare Improvidence, 2.12, by Prodigal, 2.16, and dam of Owassa, 2.06¾, full sister of Catalon. Catal is a half brother of Uhlan 1.54½, the world's champion trotter. Cataion sired the second fastest two two year olds ever raised in this province, Ima Catalon winning the race in Summerside in 1917. Second heat in 1.12½. This is a very speedy mare and I feel will make a great race mare. She is also for sale. If interested, come and see her.

R. O. M. HOLSTEINS

EXTRA SPECIAL—I recently imported several Tuberculin Tested R. O. M. daughters of "Sir Lyons Segis" whose six nearest dams average over 30 lbs. butter each in seven days. These cows have in turn been bred to "Riverdale Lyons Echo Posch" whose dam, grand-dam and great grand-dam and dam's sister average officially 34 lbs. butter each in seven days. Am offering young bull calves of this remarkable combination of breeding and will sell a helfer calf or two. Get your orders in quick, they won't be here long.

J. H. STOCKTON, BULL'S CREEK FARM, WOODSTOCK, N. B.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

Phone or write,

R, L. HICKS

DALHOUSIE JCT., - - - N. B.

FOR SALE

Pure Bred Registered Percheron Stallion "King Ferdinand", foaled March 16, 1916, pure black in color, broken to work, weight 1600 pounds, sired by Gresham, champion of Maritime Provinces. Dam, Lady Belle, equally undefeated.

This is a splendid opportunity to secure a horse of exceptional good breeding. Inspection of stables solicited.

Holstein Herd Averages 18812 lbs. Milk

A herd of 13 purebred Holsteins last year averaged 18812 lbs. milk and 638.57 lbs. fat.

Do you realize the money there is in such cows? It is estimated that the average annual yield of all cows in this country is under 4,000 lbs. These 13 cows produce as much milk as 62 cows of the 4,000-lb. class.

Why feed, milk and shelter any more cows than you need to produce the milk you require? If interested in

Make Your Dollars Earn More

The Farmer knows very well that the great increase in the price of the products of his farm has been largely offset by the unprecedented advance in the cost of labor, feed and the necessities of life which he himself does not produce. If he made money ten years ago to do as well now, he must make considerably more. But there is one thing to keep in mind. Just as his hired man earns twice the wage of ten years ago, SO WILL THE FARMER'S DOLLAR EARN TWICE THE WAGE.

There are on the market to-day High Grade Industrials, fully protected, paying Dividends in Quarterly instalments of from seven to eight per cent. annum. At St. Stephen, N. Dominion Tires "Are Good Tires"

NOBBY TREAD

Nobby Treads

Why?

Because It's Puncture Proof

AS near proof against ordinary punctures as any pneumatic tire can be made so, is the Dominion 'Nobby' Tread.

When the Dominion 'Nobby' Tread Tire was first placed on the market, motorists were quick to recognize the exceptional hardihood of this tire.

'Nobby'—an excess mileage tire!

The Dominion 'Nobby' Tread appeals to the motorist who does not consider first cost, but regards only the final cost of a tire based on service.

And never before have the buyers of automobile tires been so critical of real economy. They have learned to distinguish between the low priced and the economical.

Royal Cords

Why?

The Best Tire at Any Price

FOR the motorist who wants the best tire made—in luxury, riding, comfort and economy—

That's why—Dominion 'Royal Cord'!

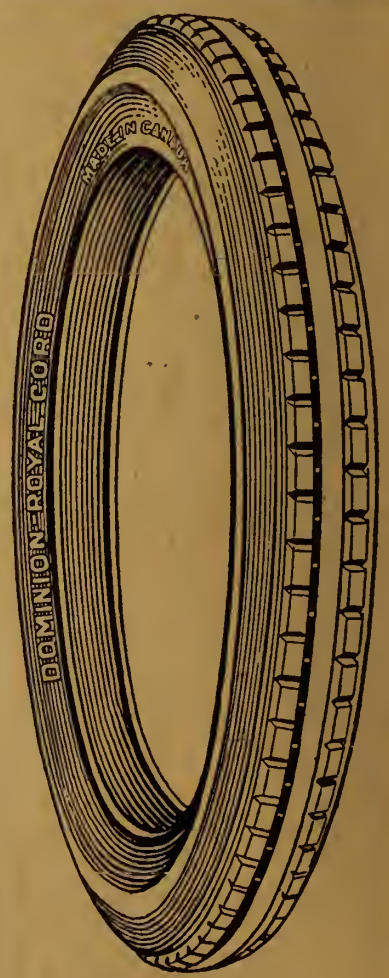
For those who require the master-creation of the tire builders' art, who look rather to ultimate economy than the amount of purchase price—Dominion 'Royal Cord' has been designed.

Known wherever good tires are recognized, as the Monarch of all Cord Tires—Dominion 'Royal Cord.'

10;20;30,000 Miles!...

Nothing exceptional in such mileage from a Dominion 'Royal Cord' Tire even though it is 30,000 miles—and more.

Dominion 'Royal Cords' are Non-Skid, and are so designed as to be equally desirable for all four wheels—their construction reduces side-slipping without impairing the ease in steering.



ROYAL CORDS

Dominion Rubber System (Maritime), Limited, - - St. John, N. B., Halifax, N. S.

Beauty, Fire-resistance, Economy combined in this Roofing

MANY costly homes have been roofed with Brantford Asphalt Slates. Architects select these slates because of the artistic beauty of the soft, harmonius shades of reddish-brown and dark green, which are the natural, unfadeable colors of the slates.

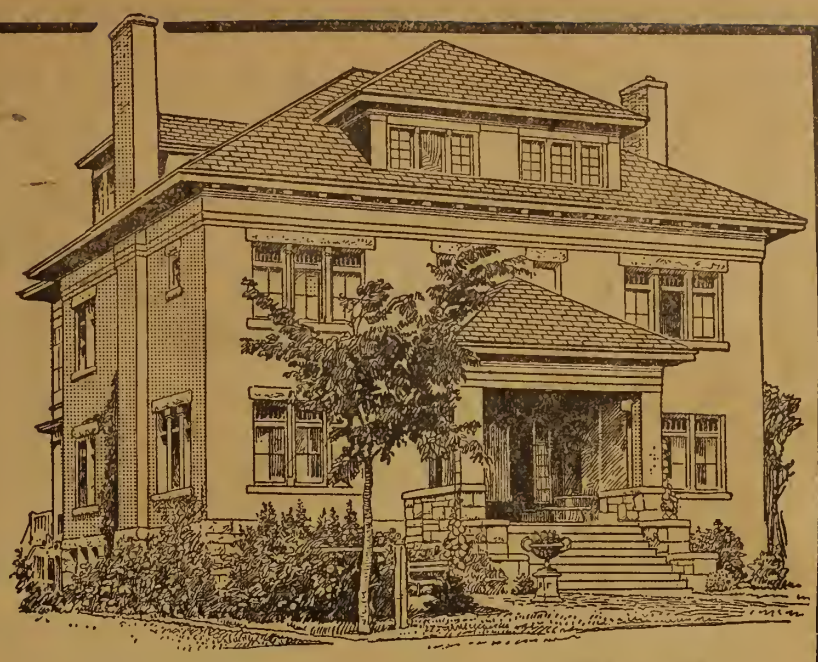
Brantford Asphalt Slates

are made from a special grade of long-fibered felt which is exceedingly absorbent, so that it will take a very heavy and thorough saturation and coating of asphalt and on top of that a surface of crushed slate. The slate is rolled into the asphalt while the asphalt is hot and becomes part and parcel of the roofing. It cannot be washed off, blown off, or even kicked off by the the heel unless you use force enough to tear part of the asphalt with it.

The regular Brantford Asphalt Roll Roofing has been on roofs for many long years and shows little or no signs of wear. Brantford Asphalt Slates have the additional slate surface and are that much heavier. They are also laid to overlap, adding still further to the wear-resistance of a roof. It seems reasonable to expect that they will last almost as long as the walls.

Non-absorbent—Do not get watersoaked

Asphalt is one of the most waterproof materials known, and Brantford Asphalt Slates being non-absorbent, do not get watersoaked and rot. Neither do they crack, break or fall off. In fact, they possess one great advantage over any other form of roofing material:— they cement together under the heat of the sun shortly after



Home in Kingston roofed with Brantford Asphalt Slates

they are laid, resulting in a solid pavement-surface on the roof under which rain or snow cannot drive and no individual slates become loose or blow off.

Brantford Asphalt Slates are wonderfully fire-resistant and are approved by the fire insurance companies, being put into the non-combustible class. Flying embers from burning buildings, sparks from threshing engines or railroad locomotives die out on Brantford Asphalt Slates. If a fire should start in an interior of a building roofed with them, the slates act as a blanket and retard the spread of the fire.

Brantford Asphalt Slates are moderate in cost, and are very rapidly laid because they are regular in size and pliable. They can be laid over ridges or curved surfaces, and every one is perfect. No knots or worm holes to look out for. No care required to avoid splitting them when nailing. And you can reroof an old building with Brantford Asphalt Slates without any extra bracing being required.

Send for illustrated booklet

Our booklet "Permanent Roofing Satisfaction" and a sample "slate" will be mailed on request. Both are worth getting if you are going to do any roofing this season.

Brantford Asphalt Slates are suitable for country homes, city homes, golf clubs, churches, garages, barns or any kind of a pitch roof where an artistic effect is desired.

Overland

TRADE MARK REG.

The Way Bumps Look — The Way Bumps Ride

An All-Canadian Car for All Canadian Roads

OVERLAND 4 travels with such remarkable ease that rough roads seem to become level as you ride.

Its Triplex Springs, a far-reaching improvement in riding comfort, effectively ward off shock and strain from the occupants of the car and every mechanical part.

Instead of slowing down or turning back for rough roads, Overland 4 keeps on going.

The general impression among Overland 4 owners is that of continually riding on good roads.

Attached diagonally at three points Triplex Springs give Overland 4 the combined advantages of light weight, longer tire, gasoline and oil mileage, and ease of driving along with the road steadiness of the heavy long wheelbase car.

In every essential Overland 4 is high grade and complete. It has Electric starting and lighting and many other conveniences.

Made in one of Canada's largest manufacturing establishments, Overland 4 is giving remarkable satisfaction and smooth riding on all kinds of Canadian roads.

FAIRBANKS-MORSE
"F" Power & Light Plant

40-Light Plant

$495

F. O. B. TORONTO

Also made in 65-, 100- and 200-light sizes

The Ideal Power and Light Plant for the farm, workshop, garage and suburban mechanic

EVERY workshop and garage depends on good light to turn out first class work. Delays, and makeshift repairs invariably occur in dingy shops where feeble light results in careless use of tools. Save time, eyesight, and expense by installing a Light Plant which supplies an abundance of light, when and where you require it.

The "F" Power and Light Plant in addition to light, provides ample power for the grindstone, emery wheel, bench drill, bandsaw, small lathe, pump, or any other light machines.

Direct belted to such machinery the "F" plant engine does the work of a power plant twice its horsepower, supplying current to drive the same machines by individual electric motors. It is sturdy and simple in construction, is self-starting, and can be operated by a boy. Its utility enables every rural family to enjoy the comforts and conveniences of brilliant light, electric current, power, and running water in the house, the barns and other buildings. Considering its low price and its economy in operation it is particularly suitable for the requirements of the farmer and small machine shop and garage owner.

Send coupon to our nearest office and we will be glad to send you full particulars about the "F" Power and Light Plant.

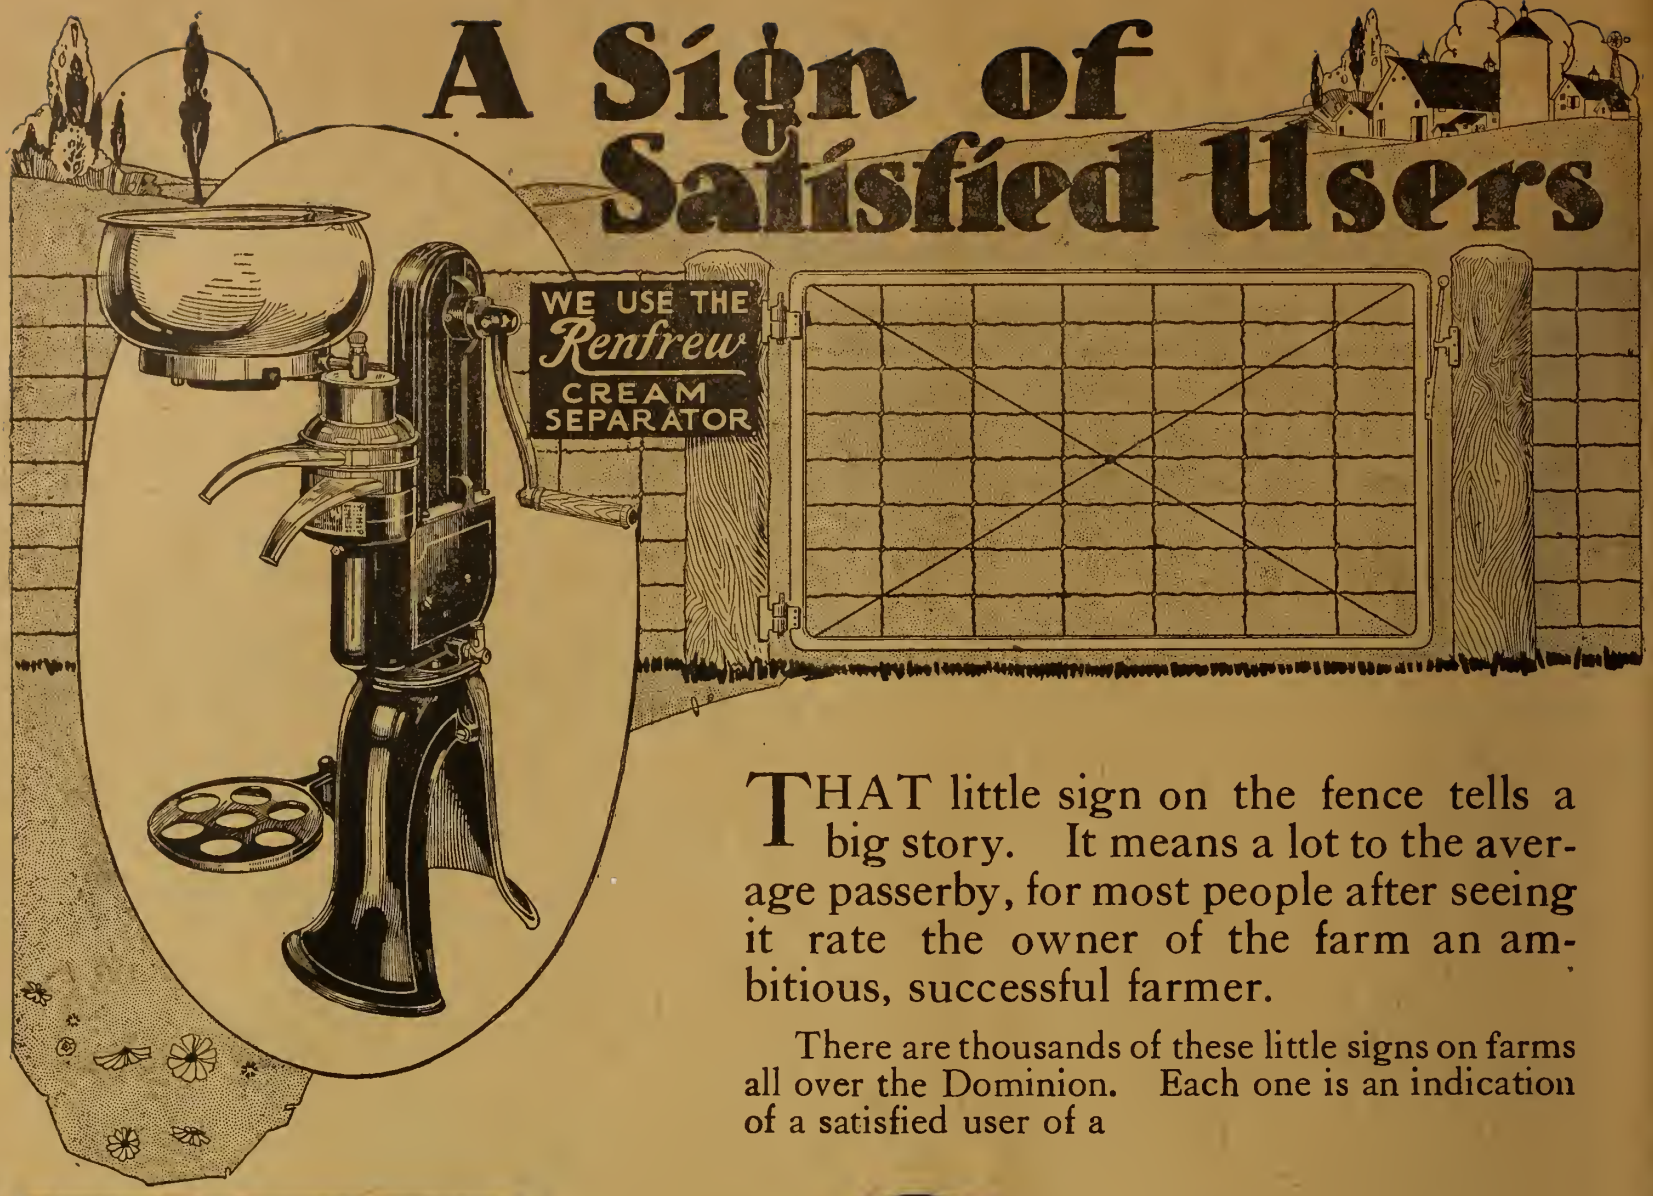
A Sign of Satisfied Users



THAT little sign on the fence tells a big story. It means a lot to the average passerby, for most people after seeing it rate the owner of the farm an ambitious, successful farmer.

There are thousands of these little signs on farms all over the Dominion. Each one is an indication of a satisfied user of a

Handsome Compliments From Some of Our Busy Agents

—"Will say I formerly sold the —— Separator, but changed to the Renfrew on account of the general absolute satisfaction that it gives to the user."

—"We have not had a single complaint of any kind on any Renfrew Separator, and believe them to be easily cared for and sanitary."

—"Three farmers I sold Renfrews to six years ago volunteered the statement that their machines are running just as easy and skimming just as close as when they bought them. In their opinion they couldn't wear out as they had not spent a cent on them except for rubber rings in all that time.—"

—"We have sold over 200 Renfrews, and have our *first* dissatisfied customer to find.—"

—"We have had some of your machines out for seven years. They have never required repairs and are skimming to-day down to .01 per cent.—just as close as when they started. We have never had any dissatisfaction, and *know there is no better separator made.*—"

(Names and addresses on request.)

Renfrew

CREAM SEPARATOR

—The Separator that on Government Dairy School tests gets 99.99 per cent. of the butter fat.

It is the separator with the interchangeable capacity. Renfrew owners are never worried about increasing their capacity. They simply order a bowl of the size they will need—450, 650, 800 or 1,000 lbs.—with attachments. We make an allowance for return to us of the smaller equipment. The cost of making this change is very moderate.

All Renfrew machines have the same size of frame, which is strong enough for the largest capacity. Thus, a separator can be changed from 450 to 1,000 lbs. capacity without increasing the strain on the machine.

It is the only separator having the perfected curved wing centre-piece that distributes milk to discs without whipping. That means *solid, better-priced butter.*

The anti-splash milk-can prevents milk splashing out on the floor, and is at a convenient low height for pouring in milk.

All working parts are enclosed in oil-tight, dust-proof housings. The Renfrew is self-oiling, and requires re-oiling only four times a year. The crank is just at the right height for comfort.

The Renfrew Cream Separator, built in Canada by Canadian workmen, and manufactured with Canadian capital—owing to its solid construction, lasts a lifetime, and costs next to nothing in repairs or replacement of parts. Renfrew users estimate that the Renfrew is a 33⅓ per cent. better investment than an ordinary separator.

Write for our catalogue and Dairy School tests of the Renfrew.

Your Money ! No Matter How Sordid

George F. Chipman Editor of the Grain Growers' Guide Enunciates a Policy Far More Rotten Than Has Been--Farmers Proposed Victims--The Guide the Beneficiary

Recent issues of the Grain Growers' Guide, the parent of the United Farmers' Guide, of Moncton, have been indulging in hysterics. The Guide alleges that it has been systematically deprived of the advertising of Canadian manufacturers, whom it divides into two groups, the "sane manufacturers," meaning those who patronize the Guide, and the "Divine Right Protectionists," ill starred fellows, who do not pay money into the coffers of the paper.

It calls for a remedy. The suggestion is that no western farmer buy goods unless he sees them advertised in the Guide. Of course those advertised in that paper may cost them a few more dollars more or less, and at that he may get an inferior article, but he is not to worry over that. His reward is to lie in the knowledge that money is being paid into the treasury of the Guide, which in turn will pay Mr. Chipman's salary and according to that gentleman will be devoted to propaganda work among the farmers of Canada, and among other things, we suppose, help pay the salaries of the representatives of the Grain Growers of the west, who are at present busy in the Maritime Provinces working up an organization, which the Maritime Farmer again asserts will be used for the advantage of the grain grower. So at least the Guide is frank as to the source of the funds which it has been spending so lavishly in these parts. They have been supplied by the manufacturers of Canada, through the Guide's advertising columns.

Let its own words be taken down, as submitted by its editor, Mr. George F. Chipman, in its issue of February 25th. After quoting its revenue for the months of December and January it says:

"It will readily be seen that advertising revenue is necessary, in order to make the Grain Growers' Guide a successful publication, able to carry on its work in support of the policy of the organized farmers of Western Canada." You will note the **policy of the Orangized Farmers of Western Canada. Just what the Maritime Farmer has contended the Guide and its representatives have been doing. You see it speaks freely in the west for western consumption. .Its Monctno child will no doubt look after Eastern farmers under the skilled direction of the same Mr. Chipman.**

But the Guide does not propose to submit tamely to the treatment which it says has been handed out to it, and so it invites farmers to buy as suggested above and lays down these rules for their guidance, (March 17th issue):

1.—Make it a practice when reading The Guide to inspect the advertising pages also, and see what announcements they contain of interest to you.

2.—When you are buying any advertised products as far as possible buy those advertised in The Guide.

3.—When you answer an advertisement say that you saw it in The Grain Growers' Guide.

4.—When you wish to purchase some advertised product that is not advertised in The Guide write a letter to the firm and point out the value of The Guide as an advertising medium and the reason why you support The Guide advertisers. Tell your local dealer the same.

5.—If you find any advertiser in The Guide who fails to give a square deal notify The Guide immediately, giving all the facts.

These rules will maintain the organized farmers in their present position where their own paper can always be free to fight their battles without fear or favor. It will also enable The Guide to publish more frequently than once a week.

It is the purpose of The Guide to publish an up-to-date list of its advertisers from time to time for the assistance of its readers.

Note.—This list of advertisers on this page is made up to include only the issue of March 10. There are some advertisers in this issue not on the list. These will be included in the next list.

That Apparently is an Innocent Suggestion. Let us Examine it

In the first place these "Divine Righters" to which the Guide refers are men who are engaged in manufacturing in this country. They have been denounced, time and again by the Grain Growers Guide, as debauchers of legislatures, raisers of corruption funds, robbers of the farmers, men who have injured Canada and particularly the rural sections of it, indeed, they are, according to the Grain Growers' Guide a hard lot and if half be true that the paper has said of them, this land should invest in a few more penitentiaries.

But that is not all. Where the Grai nGrowers Guide leaves off Hon. Mr. Crerar and the Canadian Council of Agriculture, whose mouthpiece the Guide is, takes up the story. Here is what the New National Policy says of these alleged desperadoes:

It declares that trusts, combines and "gentlemen's agreements" are fostered in almost every line of Canadian industrial enterprise, by means of which the people of Canada—both urban and rural—have been shamefully exploited through the elimination of competition, the ruination of many of our smaller industries and the advancement of prices on practically all manufactured goods to the full extent permitted by the tariff.

And then it declares that three dollars pass into the pockets of manufacturers to every one that goes into the Canadian treasury, making the poor, poorer and the rich richer. ...

Further it says that the protective taic (and consequently the manufacturers) have been the chief corrupting influence in our National life, refers to their unjust privileges and declares that public morality has been lowered by those who have been protected by the tariff.

We want our readers to carefully note these statements as made by the Guide and the Council of Agriculture, in order that they may better grasp the proposition enunciated my Mr. George F. Chipman, editor of The Grain Growers' Guide, and the self-professed Moses, who is to lead the farmers of this country out of the wilderness of tribulation and oppression.

One would suppose that a person, breathing the lofty sentiments of the editor of the Grain Growers' Guide, and feeling that money had been wrung from the farmers of this country by such diabolical methods as described herein, would have once closed his advertising columns to these robbers of the farmer, those corruptes of legislators and lowerers of publice moality. But not so. **Not only did The Grain Growers' Guide refrain from protecting its readers from what it claimed to be persons of very doubtful probity, but as we have pointed out, It has insisted that these alleged waylayers of farmers return at once their advertisements to the columns of The Guide, in order to attract new victims from among its readers and thus put a few more three dollar bills into pockets of which The Guide professes to think so ill.**

The ethics of Mr. Chipman's suggestions rather impress their rottenness on one the longer one thinks them over. Says The Guide in effect: "Here are men who have corrupted their country, but we need their money and we want it. And we want you, Mr. Farmer, to help us get it. The Guide has established a paper in the Maritime Provinces, and we must pay for it. If we do not have advertising we can't pay, unless possibly we take our own money. So if you will follow our advice, we will soon bring those corrupters of legisaltures and the common people, and enemies of their country to time. We will advise you when these robbers of the farmer relent and advertise with us. When they do this we will recommend that you buy from them. **Remember The Guide needs the money and for that reason we ask you to overlook all the charges we have ever made against these people, disregard their reputation for crooked dealing, their extortionate charges and their shoddy product. Only remember that they are friends of The Guide and waste your money in the cause."**

What can be the mentality of a man who puts that sort of thing over and expects sane farmers to swallow it? Is that the sort of economics that the Canadian Council of Agriculture proposes to apply to Canada? The Maritime Farmer **invites every farmer in this country to sit down quietly and calmly and ask himself just what he would do provided his neighbor asked him to trade horses on the same basis.**

Apart from the purely economic murders committed by this Mr. Chipman, we doubt if ever any Canadian has suggested a more devilish immorality than this. There was a day when churches accepted money from the rumseller and the brothel keeper and eased their consciences a bit by declaring "that while the sources were polluted, the end justifies the means." But that sort of thing would not down, and public opinion long since made the acceptance of such donations impossible. And it was farmers and farmers' wives who brought the pressure to bear which put an end to this unseemly practise of compounding felonies with the Devil.

But how parallel are the suggestions of Mr. Chipman. Here is a man who professes to be the beacon of the farmers of this country. He prattles sophistries by the score and and the hundred. Yet he not only declares that it is right to accept money from men whom he accuses of the most serious crimes that could be recorded against them, but he resorts to blackmail to force these hush monies into his coffers and actually invites the farmers of this country to join him in extorting money which Mr. Chipman and his associates declare has been used again and again to the detriment of the interests of the farmers of this country and to threaten the very national life of Canada. Where the churches long ago decided not to tread, Mr. Chipman invites the farmers of western Canada to enter and assist him in his shameful and horrible proposal.

The Maritime Farmer had hoped that the great war would result in better things, so far as the public life of this country is concerned. Thousands of men and women prayed that such might be. In order to win for the world something higher and better than "might is right" and "the end justifies the means," thousands

(Continued on page 510)

Report of Superintendent of Agr. Societies for N. B.

To the Hon. J. F. Tweeddale,
Minister of Agriculture.

Sir:

I have the honor to submit my report as Superintendent of Agricultural Societies for the fiscal year ending October 31st, 1919.

The Societies

Grants were issued in 1919 to one hundred and fifty-three Agricultural Societies. This number includes, with one exception, the one hundred and fifty-one Societies that reported in 1918 and three new Societies organized during the year.

New Horton Society, No. 57, in Albert County, failed to report satisfactorily in 1918 and consequently did not participate in the 1919 grant. This Society is preparing to again qualify in 1920.

The new Societies organized are:

No. 184, Upper Magaguadavic, York County;

No. 185, Tracey Station, Sunbury County;

No. 186, St. Norbert, Kent County.

The total number of members reported is ten thousand two hundred and eighty-one, paying an aggregate of $14,285.00 as membership fees into the treasuries of their respective Societies. Westmorland County is the banner county in point of number of members and in total membership fees collected. It leads its closest competitor by 209 members and $508.50 in fees.

The Grants

One-half of the expenses of delegates attending the Annual Meeting of the New Brunswick Farmers' and Dairymen's Association in 1918 amounted to $1105.64. This was the first call on the $19,000 appropriation for Agricultural Society Grants. The balance $17894.36 was apportioned according to regulations and figured out at the rate of $58.50 per Society plus $0.6261 per dollar subscribed.

The above table shows an increase since 1916 of twenty-eight new Societies, 2140 members and $3059.42 in membership fees collected. This increase necessitates a reduction in the grants issued to each Society, as will be seen in this table.

It is therefore absolutely necessary that the total government appropriation be materially increased in order that the efficiency of the Societies may be maintained.

Reports show that the officials of the various Societies are working for an increased membership and several new Societies are being organized.

Among the Societies

Monthly Meetings.—I am pleased to report that the plan of holding monthly meetings is meeting with general approval. Societies that adopted this plan as a war-time emergency feature in 1917, as well as the Societies that have followed this practice for a longer period, are continuing this desirable system. These Societies find their members take a keener interest in the affairs of their organization and their community than was their wont before regular monthly meetings were held. The Societies find that in this way they can keep in closer touch with the local and Federal Departments of Agriculture and the various lines of work that is being conducted in their behalf by the respective Divisions of these departments.

The Block System—During the year, I visited a large number of the Societies. In cases where monthly meetings were held, I received the assuranec that the plan would be continued. In every Society visited, where heretofore monthly meetings were not held, the plan was adopted. In order to facilitate the work of visitation and reduce to the minimum the expense of such visitation by any member of the Staff of your Department, I inaugurated a plan whereby five or six adjoining Societies agree to hold their meetings on consecutive evenings. In this way a member of your Staff may visit and deliver his message to one society after another in a county, without the waste of time and money that obtains where a "block system" of this kind is not in operation. This system has the added advantage, that it eliminates the necessity for calling special meetings only when absolutely necessary. The officials and members of the Societies are quick to recognize the merits and efficiency of this "block system" and I have found every evidence of a willingness to co-operate in putting it into effect.

Reconstruction.—In this period of reconstruction there must be considerable of work done along reorganization lines in Simplicity, Sincerity and Service. The holding of monthly meetings on stated evenings simplifies the work of the officers, the members and officials are more sincere in their respective spheres of duty, and the Society as a whole renders more efficient service to its members in particular and the community in general. All governments, all classes and all creeds recognize the necessity for reconstruction and readjustment as post war measures. As the Agricultural Societies were the channels through which the governments kept in touch with and encouraged the masses of producers in the dark days of war, so must the Agricultural Societies continue to be weapons for Constructive work along Agricultural lines in time of peace.

Leadership.—Our societies have passed through strenuous times. There are still strenuous times ahead if we are to reconstruct on a safe and sane foundation that the storms and floods of radicalism cannot destroy. Much responsibility rests upon the officers of our Agricultural Societies. Each and every member has a wonderful opportunity for the development of all that goes to make a greater New Brunswick. Many of our farm boys are back home again with a renewed interest in leadership, and it is pleasing to note the interest they are taking in community affairs. They recognize that their Agricultural Society is a unit in the Province as a whole, and as the units advance, so advances the Province. Every action of a Society should tend to the effect that each tomorrow finds us further than today. If this feature is to be kept in the foreground, every Society in the Province of New Brunswick will have to be a progressive one, with every one in it a live member.

Every progressive Society must have live, progressive leadership. The world is crying for efficient leadership and that idea of qualified leadership applies with particular force at this time of reconstruction to all the officers of our Agricultural organizations. All personal and other considerations are being set aside and none but active, enthusiastic, level headed workers are being considered in making choice.

It may be that in carrying on lines of progress in a community the interests of a few people may receive a jolt. "The greatest good to the greatest number" must rule in matters of this kind. The society that does not give a jolt of this kind once in a while is not doing much.

I find a growing tendency on the part of the members of Agricultural Societies to encourage the younger men to take the more active offices. Some of the older members have done nobly and well in the past, and their sage council may well be relied upon by the younger men who are now taking over the leadership. I have visited many societies during the year where the old adage "Old men for council and young men for war" is being admirably put into effect. Leadership is an honorable position, but the honor of the position does not count. It is only the willing, efficient worker that counts.

The Accounts

The Accounts for the most part were submitted in a satisfactory manner. I wish, however, to here state that Societies that were somewhat slow in submitting their accounts this year, may find the lines drawn just a little tighter in 1920. Consequently, they will be well advised to mail their reports to this office not later than December 10th. Delays are unnecessary, annoying and wasteful of valuable time, which might be used to good advantage in promoting Agricultural Society efficiency.

The Membership Lists

There is no longer any excuse for withholding reports until the membership fees are all collected. With your permission, Sir, the time for completing the membership lists have been extended to May 1st. This affords the officials of each Society every opportunity to get as large and complete a paid up membership list as possible. This concession was particularly needed in sections where many of the members are employed in the lumber woods during the Fall and Winter months. A paid in advance member-

ship is the only kind of membership that counts in apportioning the grants.

What the Secretaries Reports Show

Live Stock Improvement.—A perusal of the reports submitted by the Secretaries of the various Societies show that exceptionally good results are being obtained in the improvement of livestock, through the introduction of good pure bred sires. This is made possible by the monetary assistance given by the Department of Agriculture through the channels of grants and bonuses. One of the most promising features along the lines of stock improvement is the fact that no longer are our Societies content to purchase a pure bred sire, just because he has a recorded pedigree, but because his ancestry show merits along production lines, that gives the buyers a reasonable assurance that he will be prepotent enough to transmit to his get the qualities of improvement that the progressive breeders and feeders seek.

The pure bred scrub no longer has a place in the machinery of our Agricultural Societies. Breeders who have animals of this description for sale will have to look elsewhere for a market. In this connection permit me to say, sir, that the inspection system inaugurated by your department in regard to the purchase of bulls has been the means of frustrating unscrupulous breeders and dealers in palming off pure bred scrubs on a credulous populace.

Not a few Societies complain that their efforts to breed up are being frustrated by the prevalence of scrub bulls, running at large. It is true that there is an act governing such matters, but it is claimed that as the Act reads at present, it resolves itself down to a question between neighbor and neighbor. Consequently many farmers who would be progressive have to suffer in silence rather than run the risk of creating ill feeling in their community.

The scrub bull is a menace to the dairy industry. He is more responsible for the high cost of producing milk than any other factor. He is a disgrace to the farm upon which he is maintained and reflects upon the integrity and good intentions of the community in which he is allowed to live and stamp his worthlessness.

Breeders of pure bred cattle and others interested in grading up their herds cannot maintain a standard of value of production, of quality or of dairy farm operation so long as the scrub bull helps to make up the average of those used for breeding purposes.

The pure-bred sire and his allies good feeding and careful selection are the salvation of the man with a herd of poor producing cows. Recognizing this, it is a pleasure to note in many of the reports such expression as "We have the scrub bull on the run." More power to such societies. Of them, the latter portion of the following adage can truly be said: "Some people get results if kindly encouraged, but give me the man who can do things in spite of hell." May their example be followed by many other districts until the very last scrub bull is so curtailed that he can no longer be a public menace. The men who are breeding the highest types of live stock are the men who are doing the best work for their country and themselves. The scrub bull should not be allowed to retard their progress.

Several societies report the adoption of progressive measures re the care of their pure bred sires. This much needed improvement is being largely brought about by the timely advice of the various Agricultural Representatives, who are doing splendid work by getting in close touch with the rank and file of our farmers.

Potato Blight

The prevalence of Potato Blight and consequent rot is referred to in at least ninety-five per cent of the reports, with losses estimated at from 25 per cent to 60 per cent. of the entire crop. This shows how wide spread was the devastation and the urgent necessity for a full and free educational campaign re potato spraying.

During the season, 1919, I organized and attended, with your assent, a number of spraying meetings in the Counties of Sunbury, Carleton, and Victoria which were addressed by Mr. George E. Sanders of the Dominion Entomological Laboratory, Annapolis Royal, N. S. Mr. Sanders is one of the foremost authorities in Canada on the subject of sprays and spraying—a born investigator who has been the means of saving thousands of dollars for the fruit and potato growers of the Maritime Provinces by his timely investigations and advice. His meetings in this province evoked keen interest, even among men who had been spraying for many years, and will undoubtedly mean a more wide spread and more efficient campaign against Potato Blight and injurious insects in 1920.

Mr. Sanders has agreed to come to New Brunswick to attend the 1920 Annual meeting of the Farmers and Dairymen's Association and to help stage some spraying propaganda in cooperation with the Agricultural Societies this coming season.

Ground Lime Stone

The reports also show that the Department's campaign for a more general use of Ground Limestone is bearing fruit. The whole province seems to be looking forward with hopeful expectancy for a great impetus to agriculture through the extensive use of this commodity as soon as it is available at prices within reach of the average farmer. Many instances of the very splendid results that have been obtained by the use of ground lime stone are quoted. The accounts show that despite the fairly high prices and prevailing high freight rates, large quantities of lime were purchased cooperatively and used by members of Agricultural Societies in 1919. There is probably no other matter in regard to which I have received more inquiries, both through the mail and while attending meetings, than in regard to lime and its use in agriculture and where supplies may be procured.

Quite a few farmers have already benefited very materially by the advice given by Mr. E. M. Taylor, while employed by your department, in making a soil survey in the province. His findings, where communicated to the land owners and where suggested remedies were followed out, have in every case proved beneficial.

The outcome of your representations to the railway authorities re the procuring of a cheaper rate for transporting ground lime stone is being eagerly watched. The proposal to erect a large central plant for the grinding of lime stone is meeting with general approval, as with cheaper freight rates in sight and the sale of the product ex mill at a figure not much in excess of the cost of production, it is felt that this is one of the best moves in the interest of increased production that was ever attempted in this province.

Several farmers in the county of Albert are planning to install a small plant for the grinding of their own requirements. Mr. Frank Edwards, Lower Millstream, has also installed a small plant for lime stone pulverizing.

Co-Operation

The co-operation purchase of fertilizer ingredients by Societies through the agency of the New Brunswick Agricultural Societies United, is still gaining well deserved popularity and proving a boon in results as well as in a financial saving to the participants.

The co-operative purchase of millfeeds and farm seeds is also gaining ground and here too the results are most encouraging.

The discussions at the monthly meetings are the means of getting the disinterested changed to the interested class.

Several localities report the purchase of good fanning mills, and a greater attention to seed grading and the treatment of seed grain for smut and seed potatoes for scab prior to the seeding operations. Several other districts report the purchase of dipping tanks to enable them to better care for their sheep flocks. One or two Societies report the purchase of a spraying outfit. In these latter features, I can see the footprints of my co-laborers, Mr. Hicks of the Soils and Crops Division, Mr. Walsh of the Live Stock Division and Mr. Turney, Provincial Horticulturist.

As a free lance among the Societies, I have many opportunities to hear very commendatory remarks re the splendid work that is being done, Sir, by your Department and its ever willing staff of efficient workers.

The Seed Fairs

A Provincial Seed Fair was held at Fredericton and County Seed Fairs were held at Florenceville, Perth, St. Hilaire, Bathurst, Chatham, Rexton, Port Elgin, Sussex and Fredericton. These county fairs are generally held under the auspices of some local Agricultural Societies, and as such come under the jurisdiction of my Division. The Seed Fairs as a rule were well attended and the exhibits were for the most part quite creditable. The seed Fairs are doing a considerable lot of good, both as educational features and as incentives to excel in the growing and selection of Seed.

The Fall Fairs and Exhibitions

Inter-provincial exhibitions were held during the months of September and October at Woodstock, St. Stephen, Fredericton and Chatham, all of which, Sir, received generous grants from your Department. The grants given for exhibition purposes are monies well spent. These grants make it possible for the general rank and file of our farmers and their boys, who do not have a great deal of spare time or cash for travel to see at their nearest exhibition such magnificent ideals in live stock lines as was exhibited by Snowball, the Hardings, the Dickeys, the Kings, the McIntyres, Goodwin, the Lairds, the Boswells and many other prominent breeders, not excepting the good showing in the Swine and Poultry classes by the Boys Pig Clubs and the Boys and Girls Poultry Clubs, organized by the Livestock and Poultry Divisions of your Department.

Port Elgin, St. John and Centreville held County Fairs to which you awarded some financial assistance.

Not a few agricultural societies held fairs, the prizes for which were paid out of the funds of the respective societies holding the fairs, augmented by donations from public spirited citizens.

I have attended the district fairs where the stock was being brought in at a late hour in the forenoon, and at 4 p. m. the cattle were being driven out of the gates. No time was given for visitors to examine carefully the prize winners. The whole show savored of an effort to secure the prize money and get home as quickly as possible. Officials of such fairs will be well advised to offset this tendency as their funds could be used to better adavntage along other lines of endeavor.

Agricultural Society No. 41, Woodstock, has erected during the year, one of the finest exhibition plants east of Toronto and which for location and arrangement cannot be excelled. The citizens of Woodstock responded nobly and well and the efforts they have made to erect and equip such a splendid plant deserves the hearty co-operation of every farmer in the prosperous and progressive county of Carleton.

Agricultural Society No. 88, St. Stephen, in the County of Charlotte, deserves special commendation for the progress there made in exhibition matters. This plucky organization carries on annually whether assisted by Government grants or not and as a rule, given fair weather, comes out with a balance on the right side of the ledger.

The Field Crop Competitions

Field Crop Competitions were held as in the preceding years. A full statement of the scores and awards will be found on other pages of this report. The sum of $75.00 for prizes on each of four crops, wheat, oats, potatoes and turnips was available for each oCunty in the Province. These monies were awarded in proportion to the scores made. Each and every field scoring 80 points or over participated in the awards. The amount of money available for any crop in a county was governed by a sliding scale of entries as follows: 5 entries $20.00, 6 to 10 entries $40.00, 11 to 15 entries $60.00, over 15 entries $75.00. The required acreage was wheat, 1 acre; oats, 2 acres; potatoes, 1 acre; turnips, 1 acre.

Of these crops the latter does not come under the ruling of the Seed Division, Ottawa, and consequently it is only on the other three crops, that we receive the Federal subvention. The competition in turnip growing is financed entirely by Provincial funds. This competition tends to produce a greater tonnage per acre and thus helps very materially the feed situation which is such an important ally in live stock development. Field Crops Competitions in the case of grains and potatoes have not been or-

Notes From the Nova Scotia Agricultural College

FIRST NOVA SCOTIA EGG LAYING CONTEST

An interim report, summarizing the results of the First Nova Scotia Egg-Laying Contest, from November 1st to March 20th, gives some interesting facts. It will be borne in mind that the average Nova Scotia hen, according to the last census, lays 80 eggs per year. The average production per hen in the pen which holds the record in this Contest to date is 84.4 for less than five months. This period, with the general poultry flock is the most barren of the year. January and February of this year were unusually severe months, and egg production over the country generally was very light. To birds in the contest reached the hundred mark, in fact, went slightly over it.

We are not pretending to predict what results will be shown during the remaining months, but it is safe to say that there is good prospect of at least doubling the average egg production of the country in the majority of the pens in this contest.

Here is another illustration of what can be done with good breeding, good feeding, good housing and some care. The value of eggs now produced in Nova Scotia probably runs up to $2,-500,000 per year. With the present hen population, which could very profitable be doubled, the income from eggs might easily be $4,000,000. The records of the contest up to date indicates that in the farm flock there is the same opportunity as in other agricultural activities for greatly increased profits.

The management at the College are to be congratulated on the success and promise of their undertaking. The records are the highest reached in any equal period of Egg Laying Contests so far held. The health of the birds has been excellent, only one dying up to March 20th. The following paragraph picks up some of the outstanding points set forth on the accompanying sheet of figures.

Largest production by pens: Pen 27, 422 eggs; pen 3, 331 eggs; pen 18, 314 eggs; pen 25, 293 eggs; pen 21, 278 eggs; pen 5, 273 eggs; pen 17, 268 eggs; pen 29, 242 eggs; pen 8, 233 eggs; pen 9, 231 eggs.

Individual hen records are as follows: Hen No. 132, in pen 27, 103 eggs; hen No. 90, in pen 18, 101 eggs; hen No. 135, in pen 27, 92 eggs; hen No. 69, in pen 14, 85 eggs; hen No. 12, in pen 3, 82 eggs; hen No. 25, in pen 5, 81 eggs; hen No. 121, in pen 25, 81 eggs, hen No. 88, in pen 18, 80 eggs; hen No. 131, in pen 27, 79 eggs, and hen No. 5, in pen No. 1, 79 eggs.

In looking over the individual records it must be remembered that a large number of eggs are laid on the floors of the pens, and therefore can be credited only to the pen as a whole.

A PENNY WISE POLICY

The Dairymen's Association of Nova Scotia, New Brunswick and Prince Edward Island have unitedly asked the three Provinces to furnish a total sum of about $60,000 for the erection of a suitable Dairy Schoool. The reply of the authorities in all three is: "We cannot afford it." The question being asked, however, by the people is: "How long can be afford the present policy of starving one of our basic and vital industries?"

Here is a little story by way of illustration. Some five years ago a young farmer purchased for $25 a cow which had been condemned to the block by a neighbor. By virtue of reading, attending agricultural meetings, native shrewdness and industry he had picked up some of the great principles of progress in dairying. Applying these to this particular cow, not a very promising one, he got the following results:

Average milk production, 8,186 lbs. per year.

Average fat production, 334.7 lbs. per year.

Value of fat at 44.4c. per lb., $177.50 per year.

Compare this with the record of the average Nova Scotia cow.

Average milk production 3,500 lbs. per year.

Average fat production 140 lbs. per year.

Value of fat $69.16 per year.

A difference of $108.34 per year. The cow population of Nova Scotia is about 150,000. If the average production of these could be brought up by such superior methods as this man practiced, and there is no reason why it could not, it would mean a gain to Nova Scotia alone of $16,251,000 per year, and a gain of nearly three times this amount in the three Provinces.

A Dairy School, established on adequate lines, would go a long way to make popular such progressive measures, and, what the Dairymen's Associations are asking figures out at about one eighth of one per cent. of the loss sustained by this one Province through unprogressive methods on the part of the great majority. A parsimonious policy in matters of this kind is simply suicidal, and the time is at hand when the dairy interests will be compelled by whatever means are at hand to see that their rights are considered.

GORDON SHARP JUST INSINUATES

Woodstock, N. B., March 29, 1920
Mr. James D. McKenna,
Sussex, N. B.
Dear Mr. McKenna:—

Your letter of March 19, which was addressed to Pembroke, Ont., reached us today. In reply I wish to say that at the Farmers and Dairyman's Convention in Fredericton, I told the Convention of my knowledge of a fund which had been solicited from the Manufacturers throughout Canada, with which to fight the Farmers movement in Canada. The one soliciting this fund stated that it would be used principally for buying advertising space in the papers of Canada, particularly editorial space. I left the delegates to draw their own conclusions as to whether or not your paper was receiving any of this fund.

Why you have been making the statements which you have about the United Farmers movement, is not just clear to us. If you had wished to inform the Farmers of the Maritime Provinces of the true situation, you should have written the facts of the situation as they are, instead of the article which was a tissue of falsehoods. I think it will not be worth while spending my valuable time to write letters to your paper.

Sincerely,
The United Farmers of New Brunswick
Per (Sgd) C. Gordon Sharpe,
Secretary.

The columns of the Maritime Farmer are open to any New Brunswick resident, to discuss New Brunswick problems from the farm standpoint. Mr. Sharpe should screw up his courage a bit. The Maritime Farmer has not .“insinuated”, it has made statements, for which it is prepared to assume full responsibility. It's again up to Mr. Sharpe.

ANOTHER CHALLENGE FOR MR. SHARPE

April 3rd, 1920.

Gordon Sharpe, Esq.,
United Farmers,
Woodstock, N. B.
Dear Sir:—

Replying to yours of the 29th ult., I note your reply to my request for an explanation of your statement at Fredericton.

May I again ask that you do not leave anybody to infer what you are saying, but kindly make a definite statement concerning the matter of either myself or the Maritime Farmer accepting money for services to the Canadian Manufacturers. I again invite you to do so.

Apparently you are not only willing to lie to representatives of 10,000 New Brunswick farmers, but you are also willing to hide behind insinuations. As the organizer of the United Farmers of New Brunswick, don't you think this leaves you in a rather awkward and unenviable position? We again invite you to use the columns of the Maritime Farmer to substantiate anything you have to say against this paper.

If you will display a little more courage, we will be very glad to discuss the matter more fully with you.

Yours very truly,
Jas. D. McKenna.

JDM JAC.

PRIVATE CORPORATION OUTBIDS COLLEGE

Mr. J. G. Archibald, assistant chemist at the Agricultural College, has received and accepted an offer of a position as Agricultural Chemist with the International Nickel Co., near Sudbury, Ont. The salary is over $1,000 higher than that paid him at the College. Mr. Archibald is a son of the late Rev. W. P. Archibald, D.D., is a graduate of the N. S. A. C., and of the Ontario Agricultural College, Guelph. He has given splendid service during the four years of his employment with the N. S. Department of Agriculture, and it is with regret that he is being released. However, these are times when the private corporation seems to appreciate the services osf professionally trained men even more than the institutions at which they were trained. The best wishes of his colleagues accompany Mr. Archibald to his new sphere of work.

RESOLUTION AND PETITION

We, the undersigned students of the Short Course in Dairying appreciate the instruction received, but believe conditions might be greatly improved by adding some necessary improvements, which we would recommend as follows:

1st.—Larger building; we are too much hampered for room. One room should be devoted entirely to Butter Making, everything being stationary and ideal, and one room to Cheese Making and on convenient and well equipped room to Testing where all the different tests could be carried out, also a room where Ice Cream Making might be adopted. We would suggest that this be a Maritime School, operated and owned by the three provinces.

Signed: C. M. Cox, Neil J. McNeil, Henry P. Bourgeois, Earl Weir, Colin F. McLellan, Joseph J. Morrison, Dimock Davis, Stanley Moore, Willie Fraser, Wesley Matheson, J. Mac. Burgess, Windsor R. McNeil, C. E. Gamble, Neil McDonald, Baden P. Owen, William E. Wright, C. M. Johnson, F. E. Hicks, H. V. McPhee, F. J. Nause.

STUDENTS ATTENDING THE MARITIME DAIRY SCHOOL

I.; F. J. Nause, Mahone, N. S.; C. M. Cox, Charlottetown, P. E. I.; Windsor McNeil, Cardigan, P. E. I.; Henry P. Bourgeois, Moncton, N. B.; Wm. Fraser, Antigonish, N. S.; John A. McNeil, Malignant Cove, N. S.; H. A. McDonald, Margaree Forks, N. S.; Wm. Wright, Truro, N. S.; Hope V. McPhee, West Gore, N. S.; Colin McLennan, South Harbor; Neil McDonald, O'Leary, P. E. I.; C. M. Johnson, Bedeque, P.E.I.; John L. Cameron, Lock Katrine, N.S.; Joseph Morrison, Launching, P. E. I.; Baden P. Owen, Scotsburn, N. S.; C. E. Gamble, Victoria, P. E. I.; Stanley Moore, Northam, P. E. I.; G. W. Parker, Baddeck, N. S.; R. L. Rutherford, River Hebert, N. S.; Earl Weir, Little Bass ,River, N. S.; R. T. Stewart Scotsburn, N. S.; J. D. McKenzie, Bridgewater, N. S.; H. D. Biden, Amherst, N. S.; Archie Brown, Corn Hill, N. B.

Cheesemakers Course

Neil J. McNeil, Sydney, N. S.; Stanley Moore, Northam, P. E. I.; Archie Brown, Corn Hill, N. B.; Fred E. Hicks, Wheaton Mills, N. S.; Victor Mason, Head of Millstream, N. B.; Wm. Wright, Truro, N. S.; C. M. Cox, Charlottetown, P. E. I.; Windsor McNeil, Cardigan, P. E. I.; J. C. Barrett, Belmon, Lot 16, P. E. I.

Milk Testers Course

F. J. Nause, Mahone, N. S.; John N. Beatty, Nash's Creek, N. B.; F. F. Fowlie, Little Branch, N. B.; E. R. Gourley, Stewiacke, N. S.; Robert Melanson, St. Paul, Kings Co., N. B.

NEW STOCK AT THE COLLEGE

Premier Fashion, a new Cyldesdale stallion, has recently arrived at the College, Truro. He is a son of Baron's Pride, one of the most famous Cyldesdale horses ever bred in Scotland. He is also related to this famous horse through his dam, so that he is as strong in Baron's Pride in blood as he can well be, and yet avoid all danger of inbreeding taint.

The new horse will be three years old in June. He is of magnificent build, and when fully grown will weigh a good ton. He should prove a very valuable addition to the heavy horse breeding stock of Nova Scotia.

NEW HOLSTEIN BULL

A new bull has recently been added to the College herd at Truro. He is 15 months old and a finely developed animal. His dam, Trenton Keyes Hermes, No. 46203, has a record as a three-year-old of 573 lbs. milk and of 30.09 lbs. butter, in a seven days' test. She is now in her fourth year, and will probably exceed this by a considerable amount.

TROPHY AT THE N. S. A. C.

A handsome silver shield on a mahogany backgrond adorns one of the pillars in the main hall of the College. The inscription is as follows:

CANADIAN AYRSHIRE BREEDERS ASSOCIATION

Sweepstake prize for the highest score over all breeds in the Dairy Test at the Maritime Winter Fair, Amherst, N. S.
won by
Gardum White Floss 45352
with 198.1 lbs. milk, 8.74 lbs. fat, scoring 270.97 pints.
Owned by Nova Scotia Agricultural College, Truro, N. S.

Gleanings of Agricultural Progress in New Brunswick

THE N. B. DEPARTMENT OF AGRICULTURE WILL ENCOURAGE STANDING FIELD CROP COMPETITIONS IN 1920

The subventions on account of Standing Field Crop Competitions to encourage seed production by bona-fide growers in the various counties of the province for the season 1920 are available under two forms:

A.—One for the small grower in which the area is limited to one or two acres of crop.

B.—The other adapted more especially to the large grower who will grow for sale a considerable quantity of his crop whether of potatoes, wheat, oats, barley, or clover.

A.—The minimum number of entries necessary to constitute a competition in any crop in a county shall be ten. No prize money will be awarded any contestant who does not not score as high as eighty-five points of a possible one hundred. The amount of prize money available for each crop will be seventy-five dollars to be divided into ten prizes. "To make an eligible entry a grower must give the name of the variety of any crop and the origin of the stock seed used. The seed must be practically pure and of a standard variety."

B.—The minimum number of entries necessary to constitute a combined seed crop and cleaned seed competition shall be fifteen.

The prizes will be based: 35 percent on the awards of the judge for the Standing Seed Crop, and sixty-five per cent on the awards of the judge of the Cleaned Seed; the latter to be judged either in the sack on the premises of the competitor, or at a warehouse or Seed Fair to which the growers bring the specified quantity of seed by March of the following year.

The seed will be officially graded in accordance with existing commercial standards by an officer of the Seed Branch, who will return his awards to the Provincial Department of Agriculture, which will determine the final awards and issue the prize money.

The awards on the Standing Crop will be based upon the scores given the fields by the Inspector, who will judge the crop from the standpoint of its suitability for seed purposes considering: purity of the variety, freedom from weeds, freedom from disease or insect injury, uniformity of maturity and probable yield.

To make an eligible entry a grower must give the name of the variety of any crop and the origin of the stock seed used. The seed must be practically pure and of a standard variety.

The minimum quantities of cleaned seed that competitors must be prepared to submit to the judges in order to qualify for awards are as follows:

Wheat, 150 bushels; Barley, 100 bushels; Oats, 200 bushels; Potatoes, 150 bushels; Clover, 15 bushels.

A detailed description of the various forms of assistance for Seed Fairs, Seed Exhibitions and Field Crop Competitions rendered by the Department of Agriculture, will be published in these columns and will also be mailed to the officers of all Agricultural Societies in the Province, so that the members can secure further information from the Secretary, or apply to the Department of Agriculture, Fredericton, N. B.

LARGE AMOUNT OF WOOL WIIL BE MARKETED COOPERATIVELY THIS YEAR

Last year 547 sheep raisers in New Brunswick sold 55,840 pounds of wool cooperatively. This wool was handled under the supervision of the New Brunswick Department of Agriculture, who acted as provincial agents for tbe Canadian Cooperative Wool Growers. This company is a co-operative company of wool growers and sheep men from all the provinces of the Dominion are shareholders. Last year over 4,000,000 pounds of wool was handled by this company.

Realizing the benefits derived from this progressive method of marketing wool, the New Brunswick Department of Agriculture are again supervising the work in connection with this co-operative marketing for 1920. The wool will be assembled and graded in the Exhibition Building, Fredericton. Large wool sacks, paper twine and special tags are supplied to those marketing their wool in this manner. To distribute these, the province is divided into four sections as follows:

Northumberland—Jas. Bremner, Jr., Agricultural Representative, Chatham.

Restigouche and Gloucester—J. K. King, Maritime Representative Sheep and Goat Division, 347 St. George St., Moncton, N. B.

Kent, Westmorland, Albert and Kings—J. H. King, Agricultural Representative, Moncton, N. B.

St. John, Charlotte, Queens, Sunbury, York, Carleton, Victoria and Madawaska—F. W. Walsh, Asst. Supt. for Livestock, Dept. Agriculture, Fredericton.

For further information sheep raisers should write to the officer in charge of his county.

LAYING CONTEST REPORTS

The Dominion Experimental Farms are conducting Laying Contests at six of their branch farms in the various provinces as well as at the Central Experimental Farm, Otawa. No contest is held in New Brunswick but breeders from this province have entered eight pens at the Experimental Farm, Nappan, N. S.

Contest began Nov. 1st, 1919. At the end of the 12th week (last summary available) the average production per pen at Nappan was greater than any other of the branch farms, its nearest competitor being Brandon, Man. It was, however, considerably lower than the average production at the Ottawa contest. But if the average of the eight New Bruns-

APRIL 13, 1920

SOAKING ONTARIO FARMERS

We have heard a good deal about what the United Farmers have been doing for the farmers of Ontario. If the instance which the Maritime Farmer cites herewith, is to be taken as a sample, there should be more said about what the United Farmer Co-operative Company of Toronto, is DOING TO THE FARMERS OF ONTARIO. The Farmers Sun, the official organ of the United Farmers of Ontario, in its March 13th issue, advertised seeds in behalf of the United Farmers' Coo-perative Company, Limited, 130 King Street East, Toronto. This so-called "co-operative" concern quoted the following prices on grass seeds:

No. 1 Red Clover	$47.00 per. bus.
No. 1. Alsike	41.00 per bus.
No. 2. Timothy	9.75 per bus.

The Maritime Farmer, acting for a number of Agricultural Societies and branches of the UNITED FARMERS of New Brunswick, bought all three classes of seeds and, after paying the freight from Toronto to Sussex, sold them to the organizations for these prices:

No. 1 Red Clover	$38.10 per bus.
No. 1 Alsike	33.90 per bus.
No. 2 Timothy	7.56 per bus.
No. 1 Timothy	8.56 per bus.

Just think what that means? We paid the freight from Toronto, reimbursed ourselves for the cost of handling the seeds and we sold clover, after paying $170 freight on a fifteen ton car, FOUR THOUSAND, FOUR HUNDRED AND FIFTY DOLLARS CHEAPER TO THE FARMERS OF THE MARITIME PROVINCES THAN CHARGED ONTARIO FAMERS BY THE UNITED FARMERS CO-OPERATIVE COMPANY, LIMITED, TORONTO. We sold Alsike clover just THREE THOUSAND FIVE HUNDRED AND FIFTY DOLLARS PER CAR CHEAPER THAN DID THIS PRETENDING FRIEND OF THE FAMER.. We sold No. 1 Timothy $1.35 per bushel cheaper than the United Farmers sold No. 2 seed in Toronto, AND MARK YOU, WE HAD TO PAY THE FREIGHT FROM TORONTO TO SUSSEX, and we sold No. 2 Timothy just THIRTEEN HUNDRED AND SIXTY-FIVE DOLLARS PER CAR LESS THAN THE UNITED FARMERS CO.OPERATIVE COMPANY of 130 King Street East, Toronto, undertook on March 13th last, to supply Ontario farmers with seed.

We ask the farmers of the Maritime Provinces what they think of this kind of co-operation? The Maritime Farmer publishes these facts, with the full knowledge that if they are not true the United Farmers Co-operative Company, Limited, of 130 King Street East, Toronto, may sue this paper for damages and recover. So you see, we are willing to back our opinions. We say that any concern professing to sell on a co-operative basis, and with far better facilities for buying than has the Maritime Farmer, who would charge an excess of four thousand four hundred and fifty dollars, plus freight from Toronto to Sussex, is so far departing from its professions of assiting the Ontario Farmer, that language fails this paper to express its opinion of those engaged in the game. If ever there was a concern caught red-handed in profiteering, surely it is the United Farmers Co-operative Company of Toronto. The Grain Growers have piled up a reserve of $2,500,000, which they took co-operatively from the farmers of the west. How long will it be before Ontario catches up, at the rate we have indicated.

Let us again repeat that never has a bigger fake been attempted in Canada than the present campaign which is being conducted among farmers. By that we do not mean the farmers themselves, but those self-appointed leaders who profess friendship and at the same time lose no opportunity to make big money out of their victims.

IS MANAGED AND BOOSTED FROM WINNIPEG

The statement made by the Maritime Farmer to the effect that the United Farmers' Guide is controlled, lock, stock and barrel in Winnipeg and that it will be run from there, is being more clearly established every day. Not only is the paper to be directed by Mr. George Chipman, but all literature calling for subscriptions, etc is being mailed from Winnipeg. Already the attention of the Maritime Farmer has been called to this by many farmers who have received requests for subscriptions. The new paper is intended to advance the interests of the grain growers. It is being financed by them for their own benefit and the idea is to tie up the farmers of the Maritime Provinces, so that there may be as little opposition as possible to any proposals which the west may from time to time advance. The interests of the farmers of the Maritime Provnces are not those of western Canada. There is little in common between the farm owners of the two sections. The idea is not to benefit the farmers of these provinces, but to win political control for men whose whole interests lie in the disposal of wheat, which sells on quite a different basis from the produce of our farms. All the denials possible will not down the charge of the Maritime Farmer, that the new journal is as it was intended to be, a paper to advocate western ideals.

KEEP RECORDS

It is not the keeping of records on the farm that counts. Their great value lies in reviewing these records to see what they mean and then in knowing how to apply their teachings. From farm records may be determined cost; they may indicate waste and lost motion; they may point out mistakes; they may tell the story of a man's management of his business, but if they are not interpreted, and if the lessons they may teach do not lead to imporvement of the man and his farm, then they have failed of their purpose.

SPEAK UP FOR YOUR INDUSTRY

The time is now here when it is the duty of every farmer to speak up for his interests and those of his industry. He must recognize leaders to be sure, but he must not permit these leaders to lead him astray. He must voice his convictions and refuse to follow blindly after those who may perhaps have selfish purposes in view. With farmers' organizations becoming more numerous it is especially important that farmers know and speak their own minds.

ED. NOTES

Flour is to be given another boost as a result of the recent increase in wheat prices to the wheat growers of Manitoba, Alberta and Saskatchewan (no other wheat growers were included.) And the Maritime Province farmers will get another dose of "no east, no west, but Canada for all." We notice, however, that the west is getting the money and the east is paying it.

* * * *

Just to show how much of an enemy it is to United Farmer organizations, the Maritime Farmer has been selling them seeds thousands of dollars per car less than the United Farmers' Co-operative Company, Limited, Toronto. May we ask in all seriousness which kind of friendship the rank and file of the United Farmers of New Brunswick want?

* * * *

The United Farmer movement is one apparently designed to see just how much money it can separate for its shareholders from the farmers of this country. A few thousand dollars on a car of seeds is a trifle. Is that the kind of co-operation the farmers of eastern Canada are looking for.

* * * *

It is up to the United Farmers' Co-operative Company of Toronto to defend its action in charging farmers of Ontario the prices quoted by it for grass seed in the Farmers' Sun, in its issue of March 13th, 1920. The best method of doing this is to enter action against the Maritime Farmer, and allow a jury of good, clean Kings County farmers, to say whether a profit of four thousand, four hundred and fifty dollars, plus freight from Toronto to Sussex, N. B., on one car of clover seed does not constitute something akin to highway robbery. Either that or the buyers of the U. F. O. must be dead ones or utterly incapable of buying for anybody.

* * * *

Those who wait until the last minute to order their seeds are going to wish they had followed the example of their more alert neighbors.

* * * *

The prosperity of the country depends upon the success of the farmer. From the farms come the food for the nations of the world. Those who till the soil and raise livestock have great responsibilities. Let them have every opportunity.

* * *

Did it ever occur to you that a good ad in your home paper would sell that calf, cow, or bull, or that unused machine, or those seed potatoes? It would. And you would not have to take time from your work to find a buyer. Try it.

Sheep Breeders Organize

New Brunswick Association Formed at Sussex, With Strong Executive---The Objects of the Association Set Forth

The New Brunswick Sheep Breeders Association was successfully launched at a meeting at Sussex, on Wednesday, March 31st. Burder Goodwin occupied the chair.

After fully discussing the need for such an organization the following constitution was adopted:

Constitution

This Association shall be known as "The New Brunswick Sheep Breeders' Association.

Objects.—The object of this Association shall be to encourage a general and constant improvement in sheep breeding and a better organization of breeders of sheep throughout the Province:

(1)—By co-operating with the Department of Agriculture.

(2)—By holding meetings to discuss matters of importance to the sheep industry of the Province.

(3)—By co-operating with the Exhibitions and Live Stock Associations and Societies to advance the interest of the sheep industry.

(4)—By holding or assisting to hold competitive exhibitions and educational meetings.

(5)—By contact with Market Intelligence and Market Specialists to keep sheep breeders in the Province posted on markets for sheep products and to facilitate marketing of these products to the best advantage.

Membership. — The membership shall consist of any resident of the Province of New Brunswick who is a sheep owner and upon application of membership fee which shall be fixed by the Directors of the New Brunswick Sheep Breeders' Association.

Revenue—From fees.

Meetings. — The annual meeting shall be held at such time and place as the Executive may decide.

Special meetings of the Association may be called by the Executive.

Representatives to Exhibition Associations, when such are to be appointed, shall be elected at the annual meeting. These representatives shall carry out such instructions as may be given by this Association.

No person, other than a member of this Association shall be entitled to vote or take part at any meeting of this Association.

Officers.—The following Directors shall be appointed at the Annual Meeting of the Association, one from each of the following districts:

One—Restigoche, Gloucester and Northumberland.

One—Kent and Westmorland.

One—Albert and Kings.

One—St. John, Queens, Sunbury and Charlotte.

One—York, Carleton, Victoria and Madawaska.

And two general Directors.

The President and Vice-President shall be elected at the annual meeting. An auditor or auditors shall be appoited for the current year by the Directors.

The Secretary-Treasurer shall be appointed from among the Directors of the Association and shall hold office for one year.

The Executive Committee shall be appointed to consist of the President, Vice-President, the Secretary and two other Directors to be elected as the first meeting of the Board following the annual meeting. The Directors may also elect such other committees as may be necessary.

The actual and necessary travelling expenses may be paid of members of the Board of Directors attending Board Meetings, and of members of duly appointed committees when performing the duties in connection with their office.

When practicable, the business of the Board or of any committee may be conducted by correspondence.

A letter was read from E. P. Bradt, secretary of agriculture, regretting his inability to be present and assuring the organization of the co-operation of the provincial department. A resolution was later passed thanking the department for assistance already given the sheep industry.

The fees as fixed at two dollars per annum.

Mr. J. H. King, representative of the sheep branch of the live stock division, Ottawa, spoke as follows:

"I regret very much that Mr. Bradt is unable to attend this meeting due to pressure of work at Fredericton. Mr. Bradt was to speak of this Resolution and it is certainly our loss that he is not here to do so. Therefore it has fallen to my lot to bring before you some of the points that point to the great need of a Provincial Association.

"Are you aware that every Province in the Dominion with the exception of one has a Sheep Breeders' Association? If the sheepmen in the other Provinces find this advisable why should it not apply to New Brunswick?

"The sheep industry is coming to the front and demanding more attention than practically any other line of Agriculture, and rightly so, when one considers the natural advantage that the Province has to offer for the production of a good class of sheep.

"I would like to bring before you a few figures to show the marked in-

(Continued on page 516)

Clip a Clean Crop Clean

A CLEAN crop of hay represents good profits—when it is clipped clean. Every ragged spot where the mower fails to follow the ground (rough places) represents lost hay—less profit—because the grass is not clipped clean.

McCormick and Deering Mowers

work so that the cutter bar follows the ground whether it is smooth or rough. The sickle dips down into the hollows, and with equal facility skims over the knolls, with the cutter bar close to the ground its full length—and clips the grass clean.

This is possible because of the triangular design of the drag bar which gives the cutter bar the necessary flexibility—a floating action that conforms to the ground surface. Result: No lost hay through ragged clipping, lost traction of drive wheels, or clogging of sickle.

Many such superior features in **McCormick and Deering mowers and rakes,** and in **International combination side-delivery rakes and tedders, loaders, sweep rakes, stackers,** etc., recommend these hay tools to every discriminating farmer. All these are of the same high standard of quality and efficiency. Write us about any of them. And see your nearby International agent.

SMUTS OF CEREALS AND THEIR CONTROL

(Experimental Farms Note)

The grain smuts cause serious losses in Canada. There is little doubt that the total loss each year exceeds twenty millions of dollars. The greater part of this loss can be easily prevented.

The smuts of grain that cause serious losses in Canada are the following: The loose smut of wheat; the stinking smut of wheat or bunt; the loose and covered sumts of oats, and the loose and covered smuts of barley.

The loose smut of wheat can be easily recognized by the dusty black heads that appear about the time of blossoming. The black masses of spores are soon scattered by the wind. The bunt or stinking smut is not so easily recognized in the field as the loose smut. The smutted kernels in the stinking smut of wheat are dark, but they do not break up readily and in the growing grain are more or less concealed by the chac. These dark kernels can be crushed easily, when they will be seen to consist of a mass of ill smelling black powder, the spores of the smut. At threshing time these smutted kernels or spore balls as they are often called, are broken up and the spores lodge on the sound wheat grains and give the wheat the well known smutty odor.

The oat smuts are much alike, but the chaff is usually destroyed in the loose smut, while in the covered smut the chaff usually remains enclosing the smutted parts. The spore masses of both are soon scattered by the wind.

In the covered smut of barley the smut masses are dull black in color and are at first enclosed in a thin covering. The spores are scattered about the time of the maturity of the grain. In the loose smut of barley the whole head is destroyed, and the smut masses have a greenish shade and are dispersed by the wind about the time of flowering.

All of these smuts except the loose smut of wheat and the loose smut of barley can be easily controlled by seed treatment with a solution of formaldehyde (sometimes sold as formalin). It is the safest and most effective treatment for use on the farm. It is easily applied and the cost is low. The object of the treatment is to kill the smut spores that may be lodged on the seed and thus prevent the smut being carried over to the season's crop. For this reason it is important that the solution reaches every grain of the seed treated.

The sprinkling method is commonly used for the treatment of the seed grain. One pound of formaldehyde is mixed with 40 gallons of water. While a stronger solution may be used it should not exceed the strength of one pint of formaldehyde to 30 gallons of water. Too strong a solution may seriously injure the germination of the seed. The grain to be treated may be placed in a wagon box or on a clean floor and sprinkled with this solution, using about one gallon to each bushel of grain, shovelling over the grain at the same time so each grain may become wet. The pile of grain should then be covered with canvas or sacks for two hours or more until the solution has had time to kill the spores of the smut. The grain should then be spread out to dry. Seeding should not be delayed long after treatment.

Instead of the sprinkling the dipping method may be used. It is more convenient for small quantities of seed. The grain to be treated is placed in coarse sacks through which the solution can readily pass and is then immersed in a barrel of formaldehyde solution (1 pound formalin to 40 Imperial gallons of water) for five mintes. The sack should be moved about so that the solution will penetrate thoroughly. The grain is then removed and allowed to drain and then piled in a convenient place and covered as in the sprinkling method. In the case of wheat affected with stinking smut it is best to pour the grain into a box or cask of the solution and stir until all the smutted kernels have risen to the surface. The smut balls should then be skimmed off. The solution cannot penetrate into the spore balls.

Care must be taken that the treated grain does not become reinfected from containers that have held smutted grain. The spores on sacks can be killed by soaking them in the solution used for treating the seed and boxes can be sprinkled with the solution.

Another method of seed treatment has recently been introduced for the treatment of seed oats. In this method a strong solution of formaldehyde is used. One pint of formaldehyde is mixed with a pint of water and the grain is sprayed with this solution while it is being shovelled over and then covered for a few hours as in the sprinkling method. Only a quart of the solution is used for 50 bushels of grain. Experiments have shown that this method is safe and effective for oats if properly used and has the advantage of not wetting the grain. It must be used with care as too much of the solution will seriously injure the germination of seed. The solution must be sprayed on the grain not sprinkled. It is unsafe to use this strong solution for treating other grains especially wheat as it often seriousl yinjured the germination and does not always prevent smut.

There are some good smut machines for treating seed on the market. The best of these treat the seed in a satisfactory mannner. They can be used profitably on the larger farms.

The loose smut of wheat and the loose smut of barley cannot be controlled by the formaldehyde treatment of the seed. If these smuts are troublesome, seed should be obtained from fields in which they are not present or from which the smutted heads have been removed before the spores are dispersed. These smuts can be controlled by treatment with hot water but it is not recommended for general use on the farm.

Summary and Recommendations

Good seed should be used that has been thoroughly fanned to remove all light and shrivelled grains and smut balls. Light kernels are liable to contin the spores of other grain diseases.

Treat the seed with a solution of formalin by the dipping or sprinkling

Sixty-one Dollars Made $560 Possible

Two acres of stump land—$54 for stumping powder, fuse and caps—$7 for a helper, and J. V. Bradley blew out 78 stumps ranging from 16 to 35 inches in diameter. This is one of many things

C.X.L. Stumping Powder

will make possible on your farm. That $54 worth of stumping powder gave Mr. Bradley $40 worth of fuel, and the two acres produced a crop worth $520. It will do the same for you. It will make your waste land profitable at the lowest cost.

There is money to be made in agricultural blasting. Ask about it to-day.

Bissell Silos

A Silo is almost as necessary on a farm as a pasture. It gives cattle green feed in the winter and when drought dries up the meadows in the summer. A Silo filled with green feed while it is fresh and succulent preserves it and improves it and it gives cattle an appetizing and stimulating ration. Bissell Silos are of pine or spruce staves preserved in creosote oil, steel splined, steel hoops, doors and staves are air-tight. Made in popular sizes. Prices have been made attractive. Consult us freely as to your requirements. Illustrated folders on request.

method. This treatment will also kill the spores of many other diseases that injure grain.

Care should be taken that the moist grain is not allowed to freeze. If the grain is sown when it is still damp and swollen the seeder or drill should be set to make allowances for the swelling. Usually one-half bushel more of barley or wheat and three-quarters of busel of oats will be required than of dry grain.—W. P. Fraser, Laboratory of Plant Pathology, Saskatoon, Sask.

SEEDING TO CLOVER IN P. E. ISLAND

Clover is one of our most important crops in P. E. Island. It not only supplies the stock with their most valuable winter food but it greatly improves the texture of the soil, for the crops that follow it adds humus and nitrogen that are so necessary if we would increase the fertility of our farms. Many of our farmers have lost hope of securing a uniform stand of clover in their new meadows. They have had their clover killed out so frequently that they believe the securing of a crop is largely chance depending upon the kind of winter and the early spring conditions that may occur which are beyond their control. The problem is difficult and while the weather conditions are uncertain, yet clover is being grown regularly and successfully. This indicates that most of the factors that make for success are within our reach. A brief outline of some of the things that enabled the Experimental Station at Charlottetown to secure crops of clover in new meadows is given in this article.

Clover Seed

Secure the best seed obtainable. It cannot be too good. Home grown seed of equal grade or quality is always better than imported seed because natural selection destroys the weaker type of plants or those not suited here. You are also more likely to get fresh seed. The Old English red clover did well in this Province because in some respects our climatic condition are similar. Secure plump, fresh colored, mature seed that is uniform in appearance.

Preparation of Seed Bed for Clover

When seeding out to clover prepare your seed bed for that crop and the nurse crop sown with it will be able to take care of itself. A seed bed that is good for clover is good for all cereal crop sexcept rye . Rye being the cereal crop that will do well in acid soil. When your soil is acid or you have been applying good dressings of manure give it a dressing of some form of lime. Oyster shell mud, where obtainable, is best for land that has not been mudded. Ground limestone is equally safe and more easily handled when it can be obtained at a reasonable price. These are both of greater service to the clover crop if applied the previous year. When the land is wet, drain it, either with surface or tile drains. Clover is an upland crop. Common sense is the best guide in preparing a a field for seeding out. After working the soil into good tilth so you could count on getting a good crop of grain, go at it again and give it an extra work for the crop of clover that is to follow. Clover seed is small requiring a finely worked seed bed.

Seeding

If you want to insure success, sow clover with every grain crop. Arrange your farm rotation so that there is never a break of more than one year between having nitrogen gathering bacteria on your clover roots and the starting of young clover plants in the soil again. A good stock farm rotation would be. Barley or mixed grain, seeded down with clover to plow under; Roots, Oats seeded down with clover and grass seed, Clover hay pasture. It is a satisfactory five year rotation. When seeding with a grass seed attachment on a grain drill turn the grass sprouts back so that the seed will fall behind the implement. Then cover the clover seed with the smoothing harrow. One scrape is usually quite enough as small seeds should not be covered deeply. The same method should be adopted when using the grass seed attachment with the combined seeder and spring tooth cultivator. When seeding out with a broadcast seeder it is better to sow the clover and grass seed just before the finishing scrape and after the grain has been worked into the land.

Amount of Seed

The amount of seed necessary depends upon the quality of the seed but it is always better to err on the side of heavy seeding. Under favorable conditions 4 pounds of red clover seed in conjunction with grass seed has given satifactory crops. The thicker the seeding the finer the quality of the clover hay and the better the prospects of securing a catch. The usual seeding at the Charlottetown Station is 12 pounds of timothy, 10 pounds of red clover and 2 pounds of alsike per acre. The extra seed grows the year it is sown and returns to the soil many times its cost in humus and nitrogen.

Nurse Crops

Experiments have shown that wheat is the best nurse crop for clover, barley is second best and oats third. Good crops of clover can be grown with any of these, however, provided they are not sown thick. The rates of seeding nurse crops recommended are: Wheat 1 bus. and 3 pecks, barley 2 bushels and oats 2 bushels and 2 pecks per acre.

Winter and Spring Protection

The grain crop should be cut high enough so that stubble will hold a blanket of snow over the new meadow during the winter. Hedges or any fence that will prevent the snow from blowing off the field are a great help. The rolling of new meadows in the early spring with a heavy roller just as soon as the land will carry the horses is a real life saver for the clover. It presses down the plants that have been lifted and at the same time virtually transplanting them. Many good crops of clover hay have been cut from fields that would have been bare if the plants lifted by the frost had been allowed to dry out and die.—Experimental Station, Charlottetown, P. E. I., H. Clark, Supt.

FERNS IN THE HOME

There are many reason why ferns do not grow in many homes. Lack of air moisture is one of the reasons. A very common mistake in growing ferns or any other plant is to paint the pots or to plant in tubs or cans, thereby making it impossible for the roots to get air, which is absolutely necessary. It will be noticed that clay pots are very porous and that the majority of roots will find their way to the sides for air, which they cannot get if the pots are painted, or planted in tubs or cans. In the case of the latter, the roots will find their way to the top of the soil, the result being that the first inch or two is all that the plant has to sustain it and the remainder of the soil becomes sour; the plant makes weak and deformed growth, and leaves soon turn yellow and die.

A Potato Planter that Plants 100 per cent Correct

The wish of every grower to have every hill planted to a seed is ful lled by the

OK CANADIAN Potato Planters

Dial Potato Planter

Experience and tests during the past five seasons have proven that this machine will plant absolutely 100 per cent. correct.

The seed dropping device employed consists of the endless cup system which is recognized as the most accurate method of distribution.

The seed is picked up and deposited in the pockets of the dial plate where any corrections can be made, thereby ensuring one seed piece to every hill.

The seed hopper has a capacity of two bushels and can be furnished plain or with fertilizer attachment. The two shoes for making the furrow are so adjusted as to keep the fertilizer from direct contact with the seed when the hill is covered in.

The O-K Canadian Dial Planter is durable in construction, simple in operation and gives satisfaction wherever it is used.

DAIRYING.

TREAT COWS KINDLY AT MILKING TIME

Many a dairyman after he has obtained a good breed of cows and provided them with good warm shelter and nutritious feed, thinks that all has been done towards making his dairy profitable. But often after these big steps towards success have been taken, the cows are ruined by improper handling at milking time. It is a fact that the big things gained through breeds and feeds are many times lost through mistreatment.

The cow is by nature a docile creature. Her whole duty in life is really just an elaboration of the mother instinct. She has only to be taught what is wanted of her, which should be kindly done, and she will yield a cheerful obedience. And if in training she does not develop a gentle, docile disposition, the fault is almost invariably with the trainer. If any vicious traits are shown, they have come from ignorant or unkind treatment given at some period in her life. As at milking time man and cow must come into most intimate contact, the mistreatment usually occurs then.

Some when milking seem to think that a cow's teats are made of rubber, and are destitute of feeling. They think it is necessary to grip and pull with all their might to bring the milk profusely. Then when the painful grip causes the cow to writhe and raise her foot in injured protest, the unfeeling or thoughtless milker yells at her in a voice fit to terrify even a human, and often this is followed with a kick or blow.

The teats are extremely sensitive, especially when the cow is quite young, and always when she comes into milking. Besides, it is a great and terrible loss for a few days to be deprived of the calf. In her poor, dumb grief, she is extremely nervous and irritable, and human instinct should elicit for her gentleness and forbearance. If the teats are gently stroked and softly pressed, then with the proper arrangement of the hand and fingers, pressure applied beginning at the udder and continuing down the teat, the milk will readily flow. The tendency of the milk is to the orifice of the teat, and the sensation given by the gentle pressure of the hand increases that tendency and really gives pleasure to the cow.

The cow naturally wants to get rid of the milk, and will stand quietly to have it drawn, unless some careless milker gets hold of her, hurts and scolds her, and does not understand cow nature. Then trouble begins.

The correct adjustment of the hand in milking is quite important. After gently rubbing the udder and all the teats take a teat in each hand, begin contracting the upper fingers against the teats, then the others in succession, then slacken them reversely, and then repeat the downward pressure. This contraction and relaxation rapidly yet firmly done, forces the milk out in a continuous stream. The work of milking is done more easily, as well as rapidly by using both hands. And the more rapidly, yet with gentleness, the milk is drawn, the greater the quantity, the richer the quality, and the fuller and the longer the flow.

This thing of proper methods and treatment at milking time cannot be over-emphasized. A cow accustomed to quiet, kindly treatment can have her milk flow reduced 25 per cent. just through harshness. That is a big price to pay for ignorance and ill-nature. It is too big a price for any dairyman today if he expects to make a profit off his cows and to stay in the business.

Just a simple law of nature

AN apple falling from a tree awoke Sir Isaac Newton and supplied to Science the law of gravitation. The jumping of a tea kettle lid showed James Watt the power in boiling water and gave the world the steam engine.

The intense centrifugal force generated by a revolving tubular bowl was what P. M. Sharples put into a machine for the complete separation of butterfat from milk. Later he made his greatest improvement by utilizing the vacuum generated by the same centrifugal force to lift milk into the bowl in the exact quantities that the speed of the bowl will skim absolutely clean.

The Sharples Suction-feed Separator, therefore is only an adaption of one of Nature's laws. The intense centrifugal force and the suction-feed principle in the Sharples tubular bowl guarantee perfectly clean skimming at any speed.

The Sharples discovery is protected by United States patents. No other separator is a suction-feed separator. No other maker of separators can make use of the principle.

Suction-feed makes possible the knee-low supply tank, doing away with lifting. The oiling system needs little attention. The one piece bowl—no discs—is easy to clean.

Milk is vital to the welfare of the American people. Its production should be raised to the highest point of efficiency by the use of time and labor-saving machines.

If you do not advertise your herd how do you expect the world to know what you are doing? The first point is to do a thing and the next is to publish your success abroad. Advertising is as necessary as achievement.

The most encouraging fact in farm life today is not the material benefit that discovery and invention have brought us, but it is the serious and wide-spread recognition by farmers of their duty to look after their own interests and to help create a real democracy.

BREEDING DAIRY STOCK ON THE FARM

There is a great deal said about getting rid of scrub cattle and plans

are just now being made to put some practical measures of eradication into shape, but this alone is not sufficient to keep the live stock industry progressive. Breeding must be continued or the dairy, as well as other forms of the live stock industry will perish. But mere breeding, without regard to what is bred or how it is bred, will not gain the desired end, nor will it be profitable. Increased numbers is important, but it is far from being all for which we should strive. We need the right kind, as well as a sufficient number of animals. If this demand is to be met, breeders must have an ideal, to the realization of which their efforts must be directed. Professional breeders recognize this fact and act upon it. Failure to follow their example in this respect has been a weak point in much of the breeding on the farm. There has been too little study of the subject, and too much mating of animals for breeding purposes has been done without a clear comprehension of the special qualities desired in their offspring.

It is evident that if better results are wanted there must be a change of methods. What has been good in the past should be made better in the future. Errors of the past must be corrected. The aim should be more definite. Details should receive closer attention. Of course, only pure-bred bulls and either pure-bred or high-grade cows, which are worthy specimens of the class of animals that are to be kept on the farm, will be used for breeding. If good judgment is used in the mating, the offspring should possess considerable merit. In addition to seeking general excellence there should be an effort to secure certain definite characteristics. Of those which should be sought some are of vital importance, others, though not so essential, are quite desirable. Just a few of these will be noted in the present article.

Vigor

The first item to be considered is vigor. If this is low the animals may multiply but they will neither be good producers nor valuable for any other purpose. What is worse, their descendants will, in all probability be less desirable than themselves. Breeding from such stock is highly objectionable, for weakness and defects are more surely transmitted than good qualities and they become intensified with each generation through which they are handed down. As a matter of fact, weakness is one of the very heavy handicaps of a breeding animal. If a vigorous creature proves unproductive or unsatisfactory from any other cause, it can be turned into meat, but a weakling is not of much use for that or any other purpose. The quality of vigor can be developed and and feeding, but it is largely a matter of inheritance. It is to be perpetuated by breeding from strong animals.

Size

Size is another qualification that should be taken into account when breeding animals for the dairy. It is, however, a relative term and is always to be considered with reference to the breed to which the individual belongs. What a casual observer would rate as a large cow might truly answer that description when measured by the standard of a Jersey and yet fall short of it when tested by the size of an average Holstein. In breeding for size, an effort should be made to keep within the bounds of the accepted standard of the breed that is represented. Within these limits a large animal is preferred to a small one. This, in the case of sires, is because of the influence which their size will exert upon that of their descendants. For cows, a large size is desirable because it will carry a probability that their calves will be larger than those of smaller cows; a fact that will increase the value of all that are disposed of for veal. Then, too, because of the different proportions of food required for their maintenance it is believed that the large cows are more economical milk producers than smaller ones. To secure a good size, and maintain it in the herd for successive generations, it will be necessary to breed from animals of this type.

As a safeguard against decline, very early breeding must be avoided. This deserves special emphasis in the case of heifers. Such breeding will retard their growth, and if it is followed by frequent breeding they will not reach the fullest bodily development of which they are capable. Whether this results entirely from bearing too young, too early in life, or is largely due to the strain of producing milk while too immature, is a matter regarding which there is a difference of opinion. It is probable that both of these causes are operative. The use of young bulls for breeding does not appear to be so injurious, though too early and especially too frequent service will be harmful to themselves and to their descendants.

Productiveness

The last item to be noted in this article is productiveness. This is of vital importance, and should be given great prominence in the ideal of the breeder of dairy stock. But when it comes to practice, we find that this cannot be separated from but is closely connected with, other desirable characteristics. If cows are to be good producers they must be vigorous and well developed, and must have the other qualities of excellent animals. Great stress should also be put upon their inheritance. Common sense, experience and observation unite to indicate that if the heifer calves we raise are ever to become good milkers they must be obtained from cows which have shown good milking capacity. Breeding from low-producing cows, or from sires whose dams failed to make good records will perpetuate a race of unprofitable dairy animals. The only reasonable hope of securing the quality of productiveness in the coming generation is to mate cows that have this characteristic with bulls from good milking families.—J. E. R.

Order Early Your 1920

DE LAVAL

CREAM SEPARATOR

For three years past, notwithstanding the constantly increased production, it has not been possible to make nearly enough De Laval machines to meet the demand. We shall make 25,000 more machines in 1920 than in any prior year, but are already behind deliveries in some sizes. Hence the importance of getting in your order early.

Superior as De Laval Cream Separators have always been to other separators, they are better still in 1920.

If you have milk to separate you can't afford to waste quantity or quality of product, time and convenience, through the use of any other means of separating than a De Laval machine.

An improved De Laval Separator will surely save its cost in a few months, and will go on doing so every few months for many years.

De Laval Separators speak for themselves. Their appearance and performance best demonstrate their superiority. Be sure you see and try one before buying any other or deciding to go on using an inferior or half-worn-out separator another year.

Your De Laval local agent will be glad to afford you the opportunity to do this. If you don't know him simply address the nearest De Laval main office, as below.

LIVE STOCK.

REARING THE DAIRY CALF

The farmer who begins to think about the welfare of the calf only after the cow has dropped it into his charge, has already lost several laps in the race to succeed in the cattle breeding game. The time to begin to think and act in behalf of the welfare of the calf is very soon after the cow is found safely in calf.

Special attention should be given her care and feed with the idea of keeping her in good physical condition and providing sufficient nourishment to assure a strong, well developed offspring. The idea maintained by some breeders that a cow during the dry or rest period does not require any grain is absolutely wrong, and the ultimate result will be a weakened constitution on the part of the dam, or a frail, poorly developed calf.

It is a short sighted policy to withhold the concentrated ration from the cow, when her milk flow is decreasing, and to stop it altogether when is dry. If it pays the dairyman in increased milk to give his cow one pound of concentrated feed to every four pounds of milk yield, it will pay in increased health and growthiness of the calf, if he will feed the cow some ground oats, bran and oil meal in her rest period. The amount will vary according to the cow's state of flesh. This ration will prove a valuable aid in keeping the bowels in good condition, thus eliminating one possibility of difficult labor.

The New Born Calf

At birth the bowels of the calf are packed with a heavy tenacious substance, for the discharge of which nature has produced a laxative in the colostrum, or first milk of the dam. For the first two or three days the calf should get the cow's first milk, to allow the bowels to be thoroughly cleaned out, and in condition to perform their natural functions. If this were not essential, nature would never have provided the dam with colostrum. It is often possible and advisable to assist nature but, when man attempts to improve on her laws, he is attempting something which he can never accomplish.

Very little trouble will be experienced in teaching the calf to drink. A small amount of milk given three times a day is preferable to the same amount given at two feedings, until the calf is a month old. One regular feeding schedule is one and one-half quarts new milk, morning, noon, and night for the first few days, gradually increasing the amount as the calf develops and the bowels indicate that the food is being properly assimilated. When skimmed milk is fed, the amount of new milk may be gradually reduced, and a small amount of calf meal should be added until at the end of three weeks the new milk may be entirely dropped.

Two of the most essential things in feeding are regular feeding hours and a uniform temperature of the milk. Neglect of either of these will surely lead to trouble. Very often when milk is taken direct from the separator and fed to a numebr of calves, the first few may receive it at a very nearly normal temperature but a considerable cooling will occur before the last ones are fed, especially if the weather is cold. This trouble can be easily overcome by the addition of a small amount of hot water. It is not necessary to try the milk with a thermometer each time, since a skillful feeder can tell very accurately by inserting his fingers in the milk.

Beglnnning the Calf with Grain Ration

If possible, each calf should be provided with a separate drinking bucket, kept absolutely clean, sterilized, and hung on a rack out of doors when not in use. To facilitate cleanliness, seamless metal buckets are preferable. The writer has found from experience that it is a good plan, as soon as the calf has finished drinking, to put a handful of grain, consisting of bran, ground oats and oil meal, into a small box and place it in the pen. This attracts the calf's attention for a few minutes and has a tendency to eliminate the habit of sucking the pen or the ears and rudiments of other calves when two or more are confined in the same pen. In our opinion the calf-sucking practice has much to do with the number of poorly shaped udders when the animals reach maturity.

Calves should be turned out of doors in pleasant weather for two or three hours to give them the necessary exercise. Keep a small amount of hay before them; it is wonderful the quantity of fresh clover hay that a healthy young calf will consume. It is a great preventative of scours, and it is also conducive to the development of a well-rounded frame and a good depth of body, so essential to high production in the matured animal. The conformation can be started and developed with very little difficulty before the animal is one year of age, but it is practically impossible to change the animal's shape if the calf has been neglected before reaching this age.

Feeding Calves Without Whole Milk

On farms selling whole milk it may be found advantageous to raise the calves for the dairy herd on calf meal instead of whole milk. Calves must receive whole milk until they are two weeks old. For the next week the quantity of milk can be reduced and a pound of calf meal gruel added. In the fourth week the calves on the average will require each nine pounds of milk, three pounds of gruel, a little grain and some coarse hay or alfalfa. This is a plan adopted by those successful in rearing calves without whole milk which is as follows: From 30 days to six weeks the ration consists of 6 pounds each of milk and gruel together and the calves receive 12 pounds of gruel, a half pound of grain and a small amount of alfalfa hay. At two months of age the calves are getting 14 pounds of gruel, one pound of grain and have free access to alfalfa hay. The gruel is discontinued after the fourth month, and the grain is gradually increased until by six months the calves are getting 4½ pounds of grain and all the alfalfa hay they will eat.

Gruel feeding may be continued after the fourth month if desirable, or it may be discontinued at three months of age and the calf be put on a hay and grain ration.

Remember that calves will probably be less fat and smooth when fed on calf meals than when fed on milk. However, they should be of practically the same size and in a good, thrifty condition. Milk is preferable as a feed and at equal costs should be given in preference to substitutes. The use of calf meal is valuable only when the selling price of milk makes the use of milk prohibitive.

All of the precautions to be followed in feeding whole or skim milk must be observed when using calf meals.

Here are a few worth dotting down in your dairy:

1. Do not overfeed.
2. Give feed in a clean, wholesome condition.
3. Have all utensils scrupulously clean.
4. Feed regularly and in small quantities.
5. Always feed at a temperature of 95 to 100 degrees F. Use a thermometer—do not use your finger.
6. Give the calf water to drink.
7. Be regular in everything.
8. Give the calves exercise in the open air during good weather, but do not expose them during cold, rainy weather.
9. Provide clean, well-lighted pens with plenty of bedding.
10. Whenever possible give each calf a separate pen and limit the feed of each animal. If a separate pen is not possible, stanchions must be used. Especially is this true when raising calves without skim milk.

RAISE ALL YOUR CALVES

If you are a butter maker or sell your cream you can still raise the very best of calves as a ton of skim or separated milk can be made fully equal to new whole milk for calves by adding 4 lbs. of Herbageum and there will be no trouble with scours or indigestion.

If your milk supply goes to the cheese factory or for town or city use then you must have a substitute, and the following formula will make a calf meal the equal or superior of anything on the market and at less cost and no danger of foul seeds or of any noxious matter. Take 100 lbs. oil cake meal, 100 lbs. feed flour, 200 lbs. wheat middlings, 1 lb. of fine salt and 4 lbs. of Herbageum. Mix thoroughly, stir about two cupfuls in a gallon of scalding water and feed warm. However it is not always easy to get the oil cake or feed flour and sometimes difficult to get good wheat middlings. In such case instead of the various meals use 400 lbs. of ground oats and results will be in every way satisfactory and economically obtained.

It should be noted that when feeding fresh whey to pigs the addition of Herbageum makes a wonderful difference in results. Herbageum given regularly to pigs will ensure as good bacon weights at six months as at eight months without it and the pork will be firmer and sweeter.

If you do not know where to buy Herbageum write the Beaver Mfg. Co., Ltd., of Galt, Ont. and they will send by registered parcel post a 4-lb. package for $1.40 to any address in Canada or will deliver freight prepaid to any railway station 50 lbs. for $12, or 100 lbs. for $23.00 In all cases cash with order. It would be an advantage also if you mentioned your nearest town or village as rural route addresses do not always indicate the nearest business point.—Advt.

GROFAST CALF MEAL

The meal that most successfully takes the place of new milk for raising calves. Farmers and breeders throughout the whole of Canada are using International Grofast Calf Meal with the greatest measure of success. Read what Mr. Archer of Ingersoll, Ont., has to say:—

"I have used Grofast Calf Meal for the past three years. It is just as good as whole milk. After my calves are three days old they get nothing but skim milk and your Calf Meal. I raise equally as good calves as I ever did on fresh milk and the cost is only a fraction of what the cost would be raising them on milk."

Sold in 25, 50 and 100 pound bags.

TRAINING THE CALF

Few farmers ever consider it necessary to train the male calf that is to stand at the head of the herd, or the heifer that is to become the dairy cow. No elaborate rule can be laid out for the training of the bull. Experience finds that bulls are just as different in their personality, as the men who look after them. The result is that each bull may require to be handled differently. Some bulls will remain kind and gentle simply by handling them much as other cattle are handled. If these same bulls were confined in small pens or enclosures, and treated as if one were afraid of them, they would more than likely become vicious. This is one way quiet bulls are made dangerous.

There are bulls, however, that require to be watched and these can easily be detected in calfhood, and the training will have to be in accordance with their temperament. Though all those who have to look after bulls should be prepared at all times to be on the defensive with proper equipment, it is especially so with the youngster that exhibits the least sign of a defiant temper. One point worth remembering is not to let the bull get the idea that the person in charge has the slightest fear of him. In handling the calf that is to become the head of a herd it is the wisest course to adopt the methods that fit the animal, so long as it is safe to do so, but he should be handled with the same absence of fear and fuss as any other domestic animal. There must be no fooling with the young bull even in calfhood, and the early training with the nose ring should be done without showing any temper or harshness. Firmness with kindness is the rule with the bull calf as with the young colt.

Some training is also necessary for the heifer calf, as confidence has to be restored to the naturally nervous. Handle the udder frequently, and take every chance to train her to docility and tameness either in field or stall. She should also be halter-broken in her calfhood, as it will be found an advantage in many incidents of her life. Every cow should be trained to lead and it becomes an easy matter on cow and stockman if she has got her training when in the calf and heifer stage.

HOW TO TELL AGE OF CATTLE

How do you know the age of cattle from the growth and decay of the teeth?—W. M.

Cattle have eight incisor teeth, all in the lower jaw. In the calf at birth, two or more of temporary or first incisor teeth are present. By the end of the first month, the entire eight have appeared.

When the animal is over a year old the centre pair of temporary incisors fall out and are replaced by the permanent pincers, which, at two years, attain full development.

At three years of age the second pair of permanent teeth are fully developed, and at four years the third pair, or laterals as they are termed, ae developed. At five years the animal has the full complement of incisors.

From five to six years there is a leveling of the permanent pincers, which is usually completed at six, and both pairs of intermediates are partially levelled and the corner incisors showing wear.

The pincers are noticeably worn from seven to eight years; from eight to nine the middle pairs are worn and by ten years the corner teeth.

After six years, the arch loses its rounded contour and by the twelfth year it has become nearly straight. In the meantime the teeth have gradually become triangular in shape, distinctly separated, and show the progressive wearing to stubs.

PINK EYE

What is the cause of pink eye? Can anything be done to cure or stop it? Is it a germ disease?—W. T. H.

We infer that you refer to "pink eye" of cattle, technically termed contagious opthalmia. It is caused by a specific germ and usually is contracted from affected cattle or cars, pens or yards which they have occupied. It may also be contracted on low wet pastures; at least it seems most prevalent in such places. As a rule attacks quickly subside, if the affected animals are at once placed in a darkened stable, put upon a light laxative ration and treated as follows: Night and morning bathe the eyes with a saturated solution of boric acid. That means boiling water containing all of the boric acid it will dissolve and used when cold. In addition dust the affected eyeballs on alternate days with a mixture of equal quantities of finely powdered boric acid and calomel or iodoform. In obstinate cases, where the eyeball becomes pearl-gray in ncolor and bulges outward, it often is necessary to apply once daily with a soft camel's hair brush a little of a solution of 2 grains of nitrate of silver and 1 ounce of distilled water, to be kept in a blue-glass bottle. If ulcers form, a solution of twice this strength may be applied every other day, and once daily a few drops of a 15 per cent. solution of argyrol applied with a medicine dropper or brush.

SHEEP AND PIGS IN THE TRAINING

Sheep and pigs are as susceptible to training as horses and cattle, and regularity in feeding, comfort in housing, freedom from parasites, constitute the chief mediums in the training. Their love of home, their confidence in their caretaker, is entirely a matter for the shepherd or whoever is in charge to generate. These characteristics in sheep and pigs tend comparatively more to the thrift of these classes of farm animals than in any other.

The attitude of most farmers towards domestication of animals and their early training, in the past has been that it is only for those who care to specialize in these things. But it is the duty of every farmer to himself and to his interest in the industry that he carry on the campaign of live stock domestication. Inconsiderate neglect and rough usuage of farm animals are food wasters; animals always respond well to feeding and treatment that is tempered by kindness.

At a consignment sale of Gloucestershire Spot pigs at Winterbourne, England, last week, 46 head from one herd belonging to Mr. Matthews, realized $15,000. Six of Mr. Bridgman's, all belonging to the same litter and born in February, realized the extraordinary total of $5,540, an average of $920, believed to be a record.

THE IDEAL GREEN FEED SILO

is the ideal investment for 1920

It provides succulent feed during the entire year, enabling the cows to give 25% more milk than if they were fed on a dry feed ration.

The silage ration is considerably cheaper than a dry ration with hay and other feed at the present high prices.

Every farmer who decided last season to get along another year without a silo is now saying: "I wish I had a silo." At the present high prices of milk, the Ideal Green Feed Silo pays for itself in a short time. It makes better silage, is better built, made of better material, and will last much longer than inferior silos. Thousands of Canadian cow owners have proved this to their own satisfaction.

Write to nearest office for catalogue, which describes the Ideal Green Feed Silo and gives valuable information about silage

THE HORSE

P. E. I. PROVINCIAL HORSE SHOW

The Provincial Horse Show held at Charlottetown, P. E. I., last month, was a great success.

The attendance was very good considering the weather and roads and the fact that there had eben a delay in the time of holding the show due to the non-arrival of the judges the day before.

The principal showing was in the Clydesdales of which there was a very creditable lot of animals displayed.

The grade mares also made a good show reflecting credit upon their owners.

Mr. Scharfe, the judge of the Clydesdales stated that the animals in this class shown were very good specimens but in some cases they lacked fit, as was often the case at this time of year.

Keen interest was exhibited in the standard bred class, the exhibitors including Geo. H. Reddin, W. S. McKie; P. S. Brown, Wm. Bateman, City and Roy Moreside, North Milton.

In the Hackney or Coach class there was but one entry, that of Mr. David Reid of Victoria Cross, who showed a very fine stallion.

Of grade carriage mares there was an exceptionally fine showing. Among the exhibitors in this class are A. McBeath, Marshfield; W. A. Wright, City; H. J. Kennedy, Southport; Rev. J. B. McIntyre, Tracadie; Wm. MacPherson, City; Cecil H. Stewart, Hampshire; John Crabbe, Milton; Geo. Chandler, City; M. J. Kelly, Elliotvale.

There was also a fine show of roadsters. Among the exhibitors in this class were: Henry Jones, Hazelbrook; D. N. McDonald, Springton; Keith Boswell, Victoria; E. C. White, City; B. C. Hardy, Union Road; Harry Jenkins, Hazelbrook; Frank McKay, City; W. H. Aitken, City; Gordon Hughes, City; Ernest Leonard, Cornwall; Herbert Lewis, York.

Only one Percheron was shown, that of Mr. Boswell, of French Fort.

At the Provincial Horse Show just closed the management, with commendable forethought, reserved the best until the last and when announcer Lea called for carriage mares or geldings, shown in harness, a field of horses faced Judge Gregg, which for quality and fit seldom graces a Maritime Show ring containing as it did among others a number of animals that have been winners both at home and abroad, but had never previously happened to face each other in one ring, and even when the final awards were made there were animals outside the money that had never been below first before. After a careful examination, that flashy grey owned by A. A. McBeth, Marshfield, was placed first, her superior action and manners winning her the coveted red ribbon. A handsome bay mare owned by Mr. Francis McKay, city, was second and that breedy looking grey gelding of Mr. Wright's, city, was third.

The way this large class of horses was handled in so small a ring was greatly admired and Mr. McBeth is to be congratulated on possessing such a classy piece of horse-flesh.

Draft mare or gelding shown in harness—1, Herbert Lewis, York.

HOW TO CLEAN FARM HARNESS

The oftener the harness is cleaned and greased the better. It should be cleaned and greased just before starting spring work, as you suggest. Take every piece of the harness apart that will come away by unbuckling.

The best way to wash it is to take one piece of soap and dissolve it in three quarts of hot water, to which add one quart of coal oil, which should be whipped in the soap and water so that it mixes thoroughly with the soapy water. Then add enough cold water to make the whole solution lukewarm, and wash the harness with this solution until you can easily brush off all dirt with a hard bristle brush. When thoroughly washed in this way it should be hung up and dried in a shady place. It should not be allowed to dry thoroughly before applying the grease, as the grease should be applied when the harness is still damp; the grease will go in better than when the harness is dry, and thus make the harness more flexible.

Good harness oil should be used, and this should be applied with a soft brush and thoroughly rubbed in with a rag. After a few hours the surplus oil wihch will not go in should be rubbed off with a rag, as the surplus grease tends only to make the harness sticky and collect dust very easily. Harness should never be kept in damp places, as the nickel parts will rust, the leather become moldy, and will finally rot off. All defective parts of harness should be repaired immediately, or should be replaced by a new part.

Every horse should have his separate harness. Much can be saved by properly caring for the harness, to say nothisg of the annoyance and trouble and delay which one has when something breaks at an unexpected time. A good harness should last for about eighteen or twenty years.

HORSES HAVE SPASMODIC COLIC

I have a horse 10 years old that takes periodical sickness, that lasts about an hour or so. While the attack is on he seems troubled with gas in the stomach and intestines. The other horse that works with him is also affected in the same way. They are hungry all the time, and their feed consists of alsike clover, mixed with a little timothy. Feed about half a gallon of oats at a feed. They pass short, thread-like worms about two inches long. J. J. McK.

Your horses suffer from spasmodic colic, and the causes for this trouble are many. Improper food, sudden change of diet, exhaustion from overwork, drinking cold water when heated or exhausted, constipation and worms, have all undoubtedly one cause for the colic gripes in your animals. The craving for food that your horses have and their getting thinner all the time, is a sure sign that worms are taking away all the nutriment of the food the horses consume. The thread-like worms have their abode in the anus, and the treatment should be by injections up the rectum. The following mixture is used for this purpose: Oil of turpentine, two drachms; linseed oil, one pint; mix and inject every morning for a week. A good colic draught is laudanum and sweet spirits of nitre, one to two ounces each, mixed with one pint of linseed oil and given for a drench. Be very careful aobut the feed you are giving your horses. Seeing that both animals are going the same way, it is certain that the cause in the one is the same in the other. Hay or grain that has not been well harvested or that is mouldy would be enough to give rise to the conditions you describe in your horses. Add some bran mashes per week to your ration and a daily handful or two of linseed seed meal to the oat feed. A few mangels or turnips should be provided in summer for horse feed in winter. They relish them and they act well on a horse's system.

Not so with a NEPONSET ROOF

THIS is a portion of an illustration recently used to demonstrate the superiority of metal over wood shingles as a protection against the elements.

It shows the wind ripping great holes in the wood-shingled roof. No such comparison could be made as between a metal roof and a Neponset Paroid roof.

NEPONSET PAROID

is impervious to rain, sun, wind or hail, and gives assured protection to farm buildings. There are many instances in which a Neponset Paroid roof has stood the test of every variety of weather condition for more than twenty years and is still water-tight.

If you consider roofing, don't experiment, don't waste your money—start right in the commencement and use a roofing material that relieves you of all future cares and worries—specify Neponset Paroid and be sure you receive Neponset—the name that spells honest roofing satisfaction.

The base of Neponset Paroid is a high-grade rag felt thoroughly impregnated with asphalt, making it positively waterproof and fire-resisting.

It is further reinforced with a talc surface, grey in color; or with a permanent slate surface, red or green in color.

EASY TO LAY—With every roll of Neponset Paroid is supplied sufficient nails and cement with full directions.

There is a Neponset dealer in your district. Write us for his name and a copy of our illustrated booklet "Roofing Canada."

POULTRY.

HATCH YOUR CHICKS EARLY

A. C. McCulloch.

Early hatching of chicks is one of the fundamentals of successful poultry raising in New Brunswick, and yet is a point most frequently neglected by the average farmer poultryman. This condition will always prevail unless a greater interest in poultry is aroused because of the fact that natural climatic conditions are not conducive to early broodiness.

Incubators Preferable to Hens

New Brunswick winters are cold and unless poultry receives reasonably good care and are bred and handled properly, laying stock is not likely to lay heavily until the approach of the natural hatching and brooding or reproductive season. The laws of nature have so decreed that a certain variable length of productiveness must precede the desire of the female bird to brood or incubate. This desire is increased by an increase in temperature. It therefore follows that the flock which does not lay well in winter is not likely to contain a great number of early broody hens, and if these are relied upon for incubation, our hatching season is likely to be delayed beyond the time at which chicks should be hatched for good results. Though natural climatic conditions are relatively antagonistic to best returns in winter egg production, careful attention to details and a good understanding of the general principles of feeding and management will make a properly bred flock very profitable.

Artificial incubation, speaking generally, is essential to early hatching, early hatching is essential to early maturity, early maturity is essential to high winter production, high winter production is essential to maximum financial returns from the flock. It therefore follows that artificial incubation, or the use of incubators, is one of the perquisites to the most remunerative conduct of the poultry business, even on a small scale.

Many rural poultry raisers, in fact amateur poultry raisers in general, are averse to the use of incubators. This aversion is entirely unwarranted. The operation of an incubator by many persons is undertaken by either too great a "fear and trembling" or too much of a "cock-sureness", a happy medium is most desirable. A certain amount of faith in ones ability as well as a realization that "there is still something to learn" characterize every successful incubator. Good judgment is all important and anyone possessing this quality combined with a general knowledge of heating, ventilation, etc., can successfully operate a good incubator under favorable conditions.

Use Only Good Dependable Incubators

The tendency among New Brunswick farmers to buy old worn out incubators cannot be too strongly criticised. Many of these incubators were put on the market when the principles of incubation and incubator manufacture were not nearly as well understood as at present, and such machines are very rarely satisfactory. Some of the better makes differ very little in construction to a decade ago, and if they have been well cared for may still be entirely dependable. The fact remains, however, many cheap worthless makes have been put on the market and widely sold, and are still "at large" and ready to "take in" the unsuspecting "sucker", of which it is said one is born every minute. Do not be too prone to believe all the claims for the hatching efficiency of these relics of antiquity.

A good incubator is a good investment, a poor one is a delusion and a snare. The Buckeye Incubator is one of the best on the market, is reasonable in price and readily available, being handled by various agencies in New Brunswick, e.g.

W. H. Thorne Co., St. John,
Sumner Co., Moncton.
T. Eaton Co., Moncton.

The modern Prairie State and Cyphers are also popular machines, and as a rule thoroughly reliable, but not so low in price nor so readily available.

Directions for operating the incubator are always furnished with the machine, and in most cases these should be followed very closely and will give good results.

Time for Hatching

Under New Brunswick conditions, chicks of the general purpose varieties such as Plymouth Rocks, Wyandottes and Rhode Island Reds should be hatched during the latter half of April. Leghorns and Anconas may be hatched a couple of weeks later. It may also be possible to hatch Plymouth Rocks, etc., even as late as May 15th or 20th, and still have them mature and ready to lay by Nov. 1st, but it is better to hatch them soon enough that they will not need to be forced to mature in time. Forcing birds during he growing season frequently makes them mature without sufficient growth and may reduce their egg production, size of eggs, etc., later.

Hovers and Colony House

A hover or brooder should be provided for at least the first hatch from the incubator. The portable hover made of galvanized iron and heated by a kerosene lamp are the best brooding appliances for the average farmer or small poultry raiser. This should be placed in a small colony house about 8 feet wide, 6 feet deep from front to back, 6 feet high in front, and 4 feet high in rear. It should be built on skids, 4 inches square, or round cedar poles, should have a matched lumber floor, be single

I Will Lay For You Next Winter
If you feed me right and protect me against disease with
Pratts Buttermilk BABY CHICK FOOD
Canada needs 75 million laying hens this year to take care of the overwhelming demand.
You can save every well born chick if you feed Pratts Baby Chick Food, for the critical first 3 weeks. Many use it for 5 and 6 weeks.
Mrs. F. Blakeman, Dundas, Ont., writes: "My dealer being out of your Baby Chick Food, sent me a substitute, and in consequence I have lost seven chicks at 3 weeks old in three days. I charged my dealer with it, and told him I have raised 50 chicks on Pratts Baby Chick Food and never lost a chick, and cannot account for it any other way but the wrong food."
Try it just once at our risk.
MONEY BACK IF NOT SATISFIED.
At your dealer's in popular priced pkgs., also in money-saving 50-lb. and 100-lb. bags.

boarded all round and the cracks battened. In the centre of the front should be a door of wire netting and set in this frame another to which thin cotton (about 20c per yard) is tacked. On each side of the door is a window the bottom of which is about one foot from the floor. Window frames should be hinged to the corner stud so they will swing back against the end of the house and be out of the way. A house of this description is very simple and can be built by any farmer at a very moderate price. Being on skids it can be drawn to a new location as frequently as desired.

The second hatch from the incubator may in many cases be brooded by hens, but it is advisable to have another hover in readiness if there is danger of not having a sufficient number of broody hens at hatching time. It is poor business to hatch chicks and run the risk of losing them due to lack of brooding equipment. A dozen good chicks when grown will pay for another hover. Also with eggs at present prices, it is not advisable to allow hens the time required for raising chicks.

SELECTING BREEDING BIRDS

The winter season is an unnatural laying season, and unless birds are specially bred for egg production at this time and are given good care and management, they will not likely produce many eggs until about March 1st during the average season. It is the ability to lay during this season which specially distinguishes the heavy laying or bred-to-lay strains from the average class of poultry. Even among bred-to-lay strains there is a remarkable variation in the egg producing ability of individual birds and this variation makes the selection of breeding birds essential, since high winter egg production is an inherited character and should be bred for just as seriously as any other desirable character.

Identifying the Layers

Speaking generally the laying hen is more active, has a brighter head, redder better developed comb, and sings and appears more lively than the non producer. Not all bright, active and vigorous birds however are producing eggs. A much more reliable test is the distance apart of the pelvic bones, the development of the abdomen and the color of the vent. The pelvic bones are more or less sharp bones pointing toward the rear and may be felt at either side of the vent. In a bird which has not begun to approach laying condition these bones are frequently only about three-quarters of an inch or about the width of a finger apart. As laying condition approaches they spread until they are the width of perhaps three or four inches apart.

In the non laying bird the abdomen (part between the pelvic bones and the rear of the keel or breast bone) is shrivelled up and relatively dry and hard. There is also less distance between the pelvic bones and the rear of the keel bone.

The vent of the non-layer is small, shrivelled, dry and yellow in color, with yellow skinned varieties, e. g. Plymouth Rocks, Wyandottes, Rhode Island Reds, Leghorns and Anconas. A combination of the three tests will indicate the layers practically without fail.

Selecting the Best Layers

A flock of birds of the varieties named may be very accurately graded as to the number of eggs laid by each up to the present time. It is a commonly observed fact that such birds frequently get white beaks and even white legs late in the spring or during the summer months. The explanation lies in the fact that the hen takes the yellow coloring matter from her skin and uses it in the manufacture of egg-yolks. The yellow color in the skin is observed most easily in the vent, the eye-ring (skin surrounding the eye), the beak, and the legs. In Leghorns and Anconas it is seen also in the ear-lobes which are white or yellowish. The more eggs a hen lays the more of the coloring matter is used and the nearer white the parts become.

Vent

Color disappears first from the parts where the blood circulation is fastest

SERVICE

Work on, however small your sphere may be.
Know this: True service is the best of life.
And, though the path from thorns be never free,
The thought of duty done with pcace is rife.

The seed you sow today may help to feed
The hungry, though its harvest others reap.
The fabric that you weave may stay the need
Of some poor shivering being in God's keep.

The stone you lay may help to raise the wall
That will a flood of insurrection quell.
The word you trace, however poor and small,
May help the tide of human thought to swell.

In the white glory of some infinite day,
You may, with mind made great to comprehend,
Gauge the full meaning of this interplay
Of many forces working toward one end.

And even though you never grasp it all
Still be content to do the best you can,
Trusting that whatsoever may befall
Is but a part of the eternal plan.

—J. E. DOLSEN.

WHEN LOVE CAME PEGGY LOU

(By May A. Feehan.)

John Charles Arnott was thinking. He sat on the top one of the steps leading onto the verandah, idly twisting a long stick back and forth across the verandah floor. It was very hot; the hottest, drowsiest hour of a southern, small town, summer afternoon. The leaves on the shrubs and trees hung heavy like the big weights in the tall clock in the hall, weights which Jonh Charles did not remember ever to have seen moving. Perhaps the leaves were taking their afternoon nap as John Charles should have been doing; but the bed sheets had been so very hot that after Mammy Turner had taken off his rompers and left the room, he had risen quietly, tiptoed in his bare feet down the wide hall, slid quietly down the broad rail of the stairway, and now sat, a chubby little figure in undergarments—thinking.

A big fly floated lazily past him and he hit at it listlessly with his stick, but the fly, wearing no clothes, apparently was possessed of more energy than folks would suppose, for he suddenly shot away, losing himself in the sunshine.

Old Doctor Thomas jogged past, brushing his whip across the back of Julius Caesar, driving off horse flies. Doctor Thomas waved his hand, and Julius Caesar flicked his ears in sign of recognition. John Charles feebly waved back; then, with his hands on his knees, he suddenly leaned far forward and watched them out of sight for—one the seat beside old Doctor Thomas was a white bundle! John Charles knew. Doctor Thomas was delivering a baby. God sent the babies, and Doctor Thomas stopped at different houses and left them; that was all there was to it. The very thing John Charles had been thinking of—a baby! Strange that Doctor Thomas should pass just at that moment. Perhaps the people he was going to see would refuse the baby, and Doctor Thomas would come driving back. John Charles lost no time. He changed his sitting position to that of kneeling, bending his small figure far over in his earnestness, thus presenting to the view of a chance passerby, a small fat back from which two very black soles protruded.

"Dear God," he prayed, "send me a baby sister, quick! If you haven't any white ones left, send a black one —only hurry!"

John Charles got up and ruefully surveyed his bare knees; then, hearing Mammy Turner's plodding footsteps coming down the hall, he hastily spit on his handkerchief and attempted to wipe off the smudges.

"You John Charles Arnott, what you doin' out of bed? Ain't you 'shamed, yo' mammy sick and all, and you a big boy five years old! Go 'long!"

John Charles sped up the stairway with the horrible feeling that a none-too-gentle spank might propel him onward, but he reached his bed safely and lay there listening for Julius Casar's returning hoofbeats until he fell asleep.

But Doctor Thomas did not stop that day nor the next, and the faith of John Charles swavered accordingingly, until one evening, returning form a glorious day spent at his Aunt Helen's where there were two boy cousins and thre girl ones, John Charles' father met him at the front door; he was very much excited.

"I have something to show you upstairs, John Charles," he said, something you want—a baby sister!"

John Charles was breathless. Then "Does mother know?" he demanded, and reassured on this point, stopped to think, for a fear smote him; his prayer was answered, but, like all mortals, once the seemingly unattainable is reached, he wanted a perfect gift, a gift with no reservations.

"What color is she, Daddy?" he asked anxiously.

His father laughed. "Wait until you see her. She isn't a blonde like you, she's the cutest little black thing you ever saw."

John Charles grasped the bannister for support, while his short fat legs almost refused to carry him up the stairway. "A little black thing." Then his faith returned. God had actually sent a baby sister; now He could turn her white; so all the way up stairs, clutching his father's hand in his excitement John Charles prayed, "Turn her white, God, turn her, turn her—"

The opening door of his mother's room interrupted the prayer, and John Charles ran to the bed to be seized and smothered with kisses.

"Isn't she sweet?" his mother said as she turned back the covers.

John Charles experienced a dreadful sinking sensation in his stomach as a crop of black hair met his gaze; he looked a second time, and his spirits rose a little.

"She's rather red, mother dear?" he questioned doubtfully, and amazed his mother and father by indulging in loud alughter, unusual for serious little John Charles, at his mother's explanation of the fact that the baby would soon be white. Of course; how foolish of him. God hadn't had time to turn her completely in the short, few minutes it had taken John Charles to get upstairs; perhaps her feet were still bl—. John Charles used diplomacy.

I'd like to see her toes, if I may," he begged the nurse. Again his spirits rose; the turning had been thorough, her feet were red, too; she was red all over. John Charles hugged the secret of his prayer, but he smiled pityingly on the ladies who called to see his mother and remarked on the baby sister's black hair. "When you, Mary have auburn hair and John Charles, senior, is such a blond." John Charles sometimes had to put his hand over his mouth so that they would not see him laugh. He knew, but he would not tell; no, never!

Thereafter John Charles was possessed of the faith that moves mountains, and like all neophytes, longed to convert others.

Swinging on the gate one morning, he watched an old mammy approach, trundling a baby carriage from which a grinning black picaninny showed two very white teeth to the world. John Charles called to the mammy in his soft southern drawl:

"I reckon you'd like to turn him, Auntie," he piped persuasively.

"Turn 'im chile, what you mean, honey?"

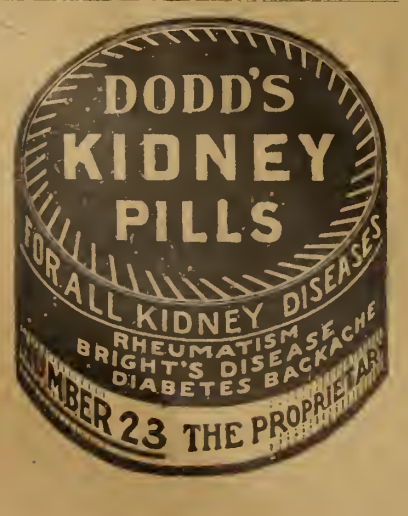
"Turn him white, Auntie. You just pray: 'Turn him white, God, turn him white,' an first he'll turn red and then be white, likke my baby sister."

John Charles clambered down off the gate and beat a hasty retreat, followed by an irate mammy's angry expostulations.

"I goin' tell yo' papa, John Charles Arnott. The idea of insinuatin' scandal about a 'spectable married colored lady. Turn 'im white, indeed. I takes mine black, I does."

Then the usual darky humor getting the best of her anger, she rocked to and fro with wild laughter which frightened John Charles all the more, and caused him to force his fat legs to their highest speed.

No baby was ever loved and petted, admired and adored as was Peggy Lou Arnott. She was christened Margaret Louise, for her mother, but, while that name suited mild, sweet, old-fashioned Mrs. Arnott perfectly, it was a misnomer for the black-haired black-eyed, vivacious bit of feminity who turned the Arnott household upside down by a mere crook of her finger. The Judge and Mrs. Arnott were "absolutely silly," so an unkind neighbor said; John Charles was Peggy Lou's adoring slave, and his admiration was so infectious that Peggy Lou's daily pilgrimage with Mammy Turner wheeling her perambulator an John Charles clinging to the handle, was a triumphal procession. Passing Aunt Helen's gate was a signal for an avalanche, the two boy cousins and the three girl ones descending in a body. The shopkeep-



I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your owu home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been beuefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

MRS. M. SUMMERS, Box 309

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatmeut which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches aud lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day trial, and if you wish to continue, it costs only a few ceuts a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

Windsor, Ontario

PIMPLES and BOILS

For Nearly Two Years.

When pimples and boils appear on the face and body it seems as if the skin is the seat of the trouble. but the real disease is in the blood.

Lotions and ointments may allay the trouble for a while, but seldom if ever cure.

You have to get under the skin; get at the blood which is the cause of the trouble.

Burdock Blood Bitters goes direct to the root of the disease and restores healthy, normal action to the different organs, and cleanses the blood of all its impurities.

Mr. E. C. Goodwin, Cambridge, N.B., writes:—"For nearly two years I suffered from boils and pimples on my face and neck, and nearly all of my body was covered with the pimples. I tried most everything, but got no relief. One day a friend advised me to try Burdock Blood Bitters, and after using three bottles the boils and pimples had all left me and there is no sign of them returning. I can strongly recommend B.B.B. to anyone who is troubled with skin disease."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

ers joined the worshipers, even old Mr. Haley who sold newspapers from a stand on Main Street, and who was never known to smile, called "Hello, sister," and waved as they passed. John Charles accepted all this as a matter of course; Peggy Lou was a different sort of baby; didn't John Charles know? There were times, particularly when passing a colored baby, when John Charles shuddered at the thought of the dire fate he had so nearly visited on his baby sister. But Peggy Lou was perfectly white; her cheeks were a lovely soft pink, her hair was beginning to curl in little soft ringlets. John Charles loved her hair, and her big, black eyes smiled at everyone.

But when Peggy Lou was sixteen a sad thing happened; she fell very ill with typhoid fever. Old Doctor Thomas called many times every day; trained nurses were sent for to Louisville and Doctor Thomas insisted on specialists from the city for consultation, though his home town people said that Doctor Thomas knew more than all other doctors put together. Poor Mrs. Arnott seldom left the sick room except to telephone the Judge, or John Charles, who now was a partner in his father's law firm.

Pegg Lou recovered from the fever but her heart was affected and the verdict was that Peggy Lou would never be strong again. She was in bed for a year; then one happy day a very weak and wan Peggy Lou was carried down stairs by John Charles. It was not long before she was able to remain down all day. A corner of the veranda was furnished for her, and here John Charles carried her every morning, and here she held court every day, until he carried her upstairs again at night. People still loved Pegg Lou. Her illness had given an etheral touch to her beauty, but beyond a delicate pallor, the year of suffering had only made her lovlier, if possible.

Peggy Lou's corner became a rendezvous; the girls flocked there, making the veranda ring with soft laughter and informing an eager Peggy Lou of all the hapepnings of their small world in the sleepy little town. Love affairs were confided to a sympathetic Peggy Lou and more than one unhappy tangle unraveled by her adroit arrangement. The boys stopped by often. Peggy Lou had been a good sport; it would be a shame to turn her down now. And the visits were no hardship, Mammy Turner saw to that. From nurse she had graduated to abject slave. Her "honey chile" would not get lonesome through fault of hers, and the visitors were treated to cakes and iced drinks, so that they came back again and again. Peggy Lou's corner became as famous as "The Cheshire Cheese."

"Have you been to Peggy Lou's corner?" was the first question asked the visiting girl or man, and the bewildered guest was forthwith started up Maple Street. Fully expecting to be shown an historic corner where Kentucky feudists had held the posse at bay, or at least, a corner where the latest lynching had taken place, the surprise was great to come suddenly on a big, rambling, white house with tall pillars; to be ushered on to a veranda, a fairy land of flowers, dainty cushions, and low, comfortable wicker chairs; to hear the tinkle of ice against tall thin glasses at one's elbow, and eats, but not least to meet Peggy Lou herself, a vision of fluff and lovliness in pink georgette negligee or pale yellow house gown. John Charles was responsible for these; he was becoming very much of a lawyer for one so young and he saw to it that Peggy Lou, who could not know the joy of pretty clothes like other girls, should, at least have the prettiest negligees to be found in the New York shops. Yes, it was a pleasant surprise, to find an unusually pretty girl holding court on a flower-decked veranda; an exceptional girl too, one whose enforced quiet life had made of her a great reader. one who could discuss all subjects, the latest books, the tariff, who was up on law, unspoiled, apparently, in spite of the adoration surrounding her. Mrs. Arnott, flitting in and out like a tiny humming bird, beseeching to know Peggy Lou's slightest whim; John Charles hanging over the back of her chair, settling cushions, lifting her from the chair to the couch when she tired of sitting up. It was a pity!

And son one expressed one's self to one's guide on the homeward walk.

It is a pity, the guide agreed, for Peggy Lou is an unusual girl, destined for big things in the world, I believe, had she her health. Yes, the doctors used to come down from Louisville, but ther's nothing to be done. We all try to help Peggy bear her enforced invalidism. The fruit man puts aside the best for Peggy when the fruit comes in, the butcher

Advertise in the Farmer

keeps the choicest cuts of meat for her, and so on. That has been going on for four years now. It's remarkable when you think of it but, then, Peggy Lou's a remarkable girl."

The speaker was Stewart Blackman, son of old Colonel Blackman. It was whispered that he loved Peggy Lou. Two afternoons each week he read to her, and together they discussed the books or the article. Stewart spent many evenings in Peggy Lou's corner also. It was a pity poor Peggy Lou could never marry, for Stewart was a fine young man. There was Johnson Bridges, too. Stewart's afternoons were so arranged as not to conflict with those of Johnson Bridges. Johnson was a bachelor, a man well on toward fifty. In his youth he had loved someone very dearly, but she died the week before the wedding, and he had remained faithful to her memory. Now unkind gossips hinted that he was forgetting his early sweetheart, but Johnson scorned gossip and paid no heed to reports that reached him. He enjoyed Peggy Lou. "She talks sense," he said, "not a lot of chatter like most of these silly women."

Peggy Lou talked sense to those who liked it, and chatter to those whose minds ran on chattering lines —she was a wise Peggy. Apparently she was happy; if she sometimes longed for a different life she kept such thoughts to herself. Everyone was so good to her, it would be wrong to complain. Even John Charles, showing her the newest dance steps to the tune of the latest dance record on the victrola; or describing to her the foootball games in Louisville; or the championship baseball games in Chicago where he had run up to see the White Sox and the Giants open the World Series; even John Charles did not know that after carrying her upstairs to bed and leaving her to the tender care of his mother and Mammy Turner, that, after they had left her, she sometimes shed a few tears because she could not be like other girls; could not have a real beau, go to dances, nor stroll at night under the big, spreading trees. To be sure she did not know with whom she would care to stroll—she usually ended by deciding ono John Charles; then called herself a wicked girl, and fell to sleep.

And so matters ran on for four years. Peggy Lou was twenty-one, John Charles was within four years of thirty and turning an interesting grey at the temples. Peggy Lou deplored the grey hairs, but not so the town girls. "He's adorable, Peggy Lou, so interesting and unusual, he looks as though he had a tragic love affair, his sweetheart died the day of the wedding, or something romantic of that sort." Susie McAllister shook her three little curls, carefully pinned toward the back of her head, and fixed her child-like eyes on John Charles as he swung up Maple Street.

"Hasn't he ever been in love?" Judy D'Arcy whispered as John Charles turned in at the gate.

"How could John Charles fall in love, Judy?" Susie demanded and added pityingly under her breath, "Poor John Charles!

A retort on Peggy Lou's lips was cut short by the object of the discussion swinging himself over the rail of the veranda and depositing himself at her feet. He did not look especially sad or romantic, he was just a big, tall, good-looking young man with a wonderful crop of light brown hair which should not have been turning gray at the temples. Peggy Lou looked at John Charles with new eyes. John Charles in love? Surely not with frivolous little Susie talking up at him, her face very close to his. There had been that northern girl, Mary Cleveland—Peggy Lou stopped.

The girls took a noisy departure, their laughter floating back long after their white dresses disappeared down Maple Street. Peggy Lou's eyes rested again on John Charles. Why couldn't he fall in love? Of course she had caught Susie's meaning. Susie was rather given to unkind remarks of that kind, but surely John Charles would not let Peggy Lou stand in the way of his happiness. She decided to investigate, diplomatically of course.

"I have a letter here from Mary Cleveland. Would you like to hear it?" she asked watching John Charles anxiously.

"Fire away," he answered absently. He did not look like a man in love, nor one whose promised bride had died on the wedding day, it was a little disconcerting.

Peggy Lou read the letter through, then prepared a course of action.

"I am glad she is coming to Terella again. I liked her immensely, didn't you, John Charles?"

"Um-um," was John Charles' dreamy answer. But Peggy Lou was determined.

"I am thinking of asking her to visit me; she seemed to like me and I believe she would come. Don't you think we could give her a good time? You could entertain her in the evenings, and all the boys and girls would help, I know."

"Of course she'll accept your invitation, and of course she like syou," John Charles reassured her, still refusing to look broken-hearted. "Write her at once, I promise you I shall do my part."

There was a long silence during which Peggy Lou watched John Charles. Everything was quiet and over John Charles' face a reminiscent smile slowly spread.

"Have you ever been in love, John Charles?" Peggy Lou shot her thunderbolt.

John Charles, roused from his reverie, jumped as if shot, while a dark flush mounted up his face and lost itself in the grey hair at his temples.

"Of course I am in love! I'm in love with a black-haired, black-eyed beauty whose name is Peggy Lou Arnott," he said rumpling the beauty's hair. But Pegg Lou seized his hand and clung to it."

"O, John Charles, you are so good to me, sometimes I am afraid. Promise me that you never will lose your chance of happiness because of me; promise me that if you want to marry—"

"Who has been putting foolish notions in your head?" John Charles interrupted. "I shall marry when you do, Pegg Lou, we'll have a double wedding." Then he went whistling into the house, but Peggy Lou sat wistfully looking after him. That tell-tale flush had told her something. John Charles could pretend indifference, could scoff at the probability of a love affair where he was concerned, but he could not deceive Peggy Lou, and the letter that was mailed to Mary Cleveland that night was so sweet and appealing that Mary, with a vivid recollection of happy hours spent in Peggy Lou's corner, cut short her visit in Frankfort and wired to expect her that very week.

It was about this time that old Doctor Thomas ,to the grief of the town, suffered his first stroke of paralysis, and sent for his nephew, Dr. Gordon, to come to Tereila and look after his practice.

Philip Gordon was a man of thirty-one, a man of independent means, but possessed with a love of the medical profession inherited from a long line of Gordons on his father's side, and handed down to him by his mother's people, the Thomases. He worked among the poor in Louisville, lived down in one of the most wretched parts of the city, and was thoroughly angry and amused at people who looked on him in the light of a hero.

"I've been blessed with plenty of money," he explained simplf. "I love my profession, and for variety of practice I can find no better place than this; so please stop this hero business; I am fortunate that these people let me serve them, that's all." And a reporter who approached him with a view to writing him up, with photographs, for the Sunday Supplement, was roughly handled, then taken back into the office and so royally treated that he left Dr. Gordon's office his friend for life. But he did not write him up.

Dr. Gordon was devoted to old Dr. Thomas, really pulled him through his stroke by his devotion, then acted his right-hand man so diplomatically that the old doctor was spared much of that feeling of usefulness which follows in such illness. Soon sufficiently recovered to drive about, it was with great pride that he introduced, "My nephew, Dr. Gordon."

"He's promised to stay with me until I tire of him," he'd say with his hand restiny as though affectionately, but in reality for support, on the young man's shoulder. "He's put a younng cub in his place in Louisville, a lazy beggar of great possibilities, but going bad for lack of ambition. Philip will run up there from time to time to keep an eye on him; the boy actually is afraid of Phil, but he's doing the right thing now and, Philip says, will be a big man some day."

One of the first visits, of course,

was to Peggy Lou's corner where Dr. oGrdon said little, but watched Peggy Lou and appraised her family. The little mother, with her humming-bird ways, complacently delighted in her self-imposed martyrdom; Judge Arnott, harkening to Peggy Lou's least whim, John Charles forestalling any exertion, almost of thought, on his sister's part; even that visiting girl, Miss Cleveland, and whom the brother seemed to like, deferring to Peggy Lou in all discussions; and Mammy Turner, bustling out every few moments, "jes to see if ma honey chile wants somefin." And Peggy Lou herself, a queen surrounded by courtiers. Dr. Gordon absorbed all this, and surprised his uncle as they let Julius Caesar turn corners and look out for passing vehicles without so much as a touch on the reins—that would have been an insult to Julius Casear.

"She is a fine little girl," Dr. Gordon said in answer to the time-honored question, "but those people are stifling her; she hasn't the ghost of a chance."

But she's very delicate—" Dr. Thomas began.

"Yes, and that fact has been dingdonged into her for so long, that the girl soon won't be able to think for herself."

Dr. Thomas bristled up. Wasn't Pegg Lou one of his babies? The first touch of anything but admiration for his nephew assailed him. But Dr. Gordon was not finished.

"How long since you have examined her heart?" he demanded.

"The last time the specialists were here was two years ago. Peggy Lou appeared to be better and one of them advised her to walk. It was dreadful. Peggy Lou fainted—"

"And never tried it again, I suppose," Dr. Gordon mumbled under his breath.

"But how long since you examined her yourself?" he persisted.

"It's some time," Dr. Thomas evaded. "I left it to these specialist chaps; they know more than I do."

"Nothing of the sort," Dr. Gordon defended warmly. "I wish you had kept it up."

"The family rather resent it I think, so I no longer suggest specialists or myself. It upsets Peggy Lou, and, of course, now I can do nothing."

"You'll soon be dancing the tango," his nephew reassured him, giving his arm a squeeze. The conversation ended, and Dr. Thomas decided that Philip had forgotten the incident; but some days later, watching John Charles and Mary Cleveland stroll past the house, Dr. Gordon looked after them. "I'd surely like to have a try at Peggy Lou," he said.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address

FIFTEENTH ANNUAL MEETING OF N. B. FRUIT GROWERS' ASSOCIATION

The fifteenth annual meeting of the New Brunswick Fruit Growers' Association was held in the Council Chamber, City Hall, Fredericton, on March 31st. Fifty-five registered throughout the day and forty were present when the meeting opened at 10.30 with President O. W. Wetmore, of Clifton, in the chair.

In his address, President Wetmore expressed appreciation of the honor conferred upon him in his election to office and complimented the organization upon having the services of such an energetic secretary as A. G. Turney, Provincial Horticulturist. In discussing the outlook for New Brunswick apples, he referred to the fact that "our apples have gained such a reputation and found such a good market right near home in Montreal." He expressed the opinion that for some years to come Montreal "might take quite a share of our output," and declared the growers had received a good return last year with one of the largest crops in history.

"Our New Brunswick strawberries proved themselves about the best that are shipped from anywhere to Montreal and other large cities," declared President Wetmore in referring to the small fruits, and he quoted prices received as 35 cents a box by the crate, which netted 29 cents f. o. b. at the shipping station—"a record price and never netting below 20 cents." He advocated growing more raspberries and blackberries, for which there was a good market, adding: "It seems that for some time prices will be good on small fruits as the large preserving concerns have about exhausted their output and there is a good paying demand from them for an almost unlimited quantity."

Mr. A. G. Turney then read his annual report as Secretary Treasurer of the Association. This report reviewed at length the various activities of the Association and the present and prospective conditions surrounding the apple and small fruit industry throughout Canada and the United States. It contains much information of interest to Maritime fruit growers, and will be published in full in our next issue. Summarised for the present, it reported the past year as the most active, useful and promising one in the history of the Association, with a membership of 174 compared with the previous high mark of 150 in 1917. The volume of the supply business showed a 35% increase over that of 1918 and Mr. Turney urged the members, in their purchase of supplies, to stick to the old firm and support their own organization,—the one that was giving them this service long before others entered the field. The competition introduced by the Association had forced other sources of supply to lower their prices.

The Secretary reported that in accordance with the resolution passed at the last annual meeting requesting that the Association be incorporated under special charter of the Legislature, the Honourable J. F. Tweeddale, Minister of Agriculture, had introduced and secured the passage of a bill incorporating the New Brunswick Fruit Growers' Association, at the last session of the legislature, and also appropriated for it a grant of two hundred dollars. The immediate and favorable action of the Honourable Mr. Tweeddale in this matter was much appreciated by the fruit growing interests of the province.

Other matters referred to in the Secretary's report were the "Summer Field Day" or Orchard Picnic; the barrel situation; the making of berry boxes and crates in New Brunswick; subscribing to the Canadian Horticulturist; the appointment of Mr. C. W. Baxter as Dominion Fruit Commissioner; the prospects for apple growing in Canada and the United States—the favorable wintering of New Brunswick

The Fence That's Locked Together

It's close enough to keep small fowl in and strong enough to keep large animals out. Securely locked together at each intersection of the wires. It's many times heavier and stronger than poultry netting, and being well galvanized, will last many years longer. Top and bottom wires are extra heavy. No top and bottom boards required. PEERLESS Poultry Fence is built so strong and heavy, that but half the ordinary number of posts are required. It gives you real fence service.

MADE IN CANADA

Note the extra close spacing at bottom, no base boards required. Turns the small chicks, keeps small animals in or out.

The Peerless Lock holds the intersecting wires in a firm grip that is non-slippable. Compare it with any other poultry fence. The Peerless fence is built to stand any test. It is durable.

DO NOT DISMISS
CONSTIPATION
AS A TRIFLE. IT IS NOT.

Half the ills of life are caused by allowing the bowels to become constipated.

When the bowels become constipated the stomach gets out of order, the liver does not work properly, and then follows the violent sick and bilious headaches, sourness of the stomach, biliousness, heartburn, water brash, or the painful, irritating internal bleeding or protruding piles.

Keep your bowels regular with Milburn's Laxa-Liver Pills and you need never be constipated.

Mrs. C. Henderson, Trail, B.C., writes:—"I have been troubled with sick headaches and constipation most all my life. Have not now been troubled for a long time. I have great faith in Milburn's Laxa-Liver Pills since using them."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited. Toronto. Ont.

SPRING TOUCHES IN THE COUNTRY HOME

Housecleaning stands for different things in different households. In some it means a sort of general upheaval, an internal revolution and a general skirmish all along the line. In other families it is done quietly and easily. and the general renovation and brightening up of the whole house after the smoke and grime of six months of closed doors and windows is a real satisfaction to the whole family. The house must be cleaned for health and comfort, and though the hard work may not appeal, the cleanliness and comfort do.

It is always wise to let nature do her own housecleaning before the housewife begins hers.

Let the cleansing rains and her strong, high winds get in their work of cleaning up the out of door world and then one may safely begin indoor renovation. There is always a good many chilly days in early spring when fire is needed, and it is not a good plan to take down the stoves too early in the spring. But, of course, the cellar can be thoroughly cleaned and whitewashed, and the closets cleaned and many other odd jobs done before the general onslaught begins. No one woman can be a law unto another as to methods of housecleaning.

One reason why the average woman enjoys the spring renovation is because of the changes and improvements she can make in her household. The woman who stays much at home get deadly tired of things as they are and the little artistic touches the new furnishings and household conveniences that she may at this time add are a source of real pleasure and satisfaction.

All are so influenced in health and spirits by our home surroundings that it is the part of wisdom to make homes as bright and cheerful as possible. And so, instead of getting into a rut and staying there, it is a good plan to make the changes and add to the furnishings and household conveniences just as far as our means will allow. Walls covered with old faded and cracked paper are depressing, and if new paper is impossible the walls maye be gone over with a thin coat of calcimine, which will leave the figures in the paper showing through a delicate outline that is very dainty and pleasing. The color scheme of the room may be changed entirely in the selection of the shade of calcimine used. Faded window shades may also be renewed by going over them with a thin paint, and any capable woman can go over her woodwork with two coats of paint, if no painter is available, just for the satisfaction of the improvement it will make in her home atmosphere.

So much of the comfort and enjoymet of the whole family depends upon the capable management of the housemother, and so much responsibility for the love of home in the hearts of her children rests upon her, that every woman should determine that her home shall be just as comfortable and home like, and also just as pleasant and attractive indoors and out as means will allow. This is a time of unusual prosperity among farm people, and there is no reason why this prosperity should not be in evidence inside the farm home as well as out of doors.

Its Lasting Freshness Brings Economy

IT ISN'T cake-making, it's cake *waste* that is extravagant. It is the cake you bake and don't *entirely* eat that is costly. Here again true kitchen thrift suggests the use of FIVE ROSES flour for *all* your baking. *It prevents waste by keeping fresh.* Long after ordinary cake is dry and tasteless and is wastefully thrown away, you can readily identify a FIVE ROSES cake by its rare freshness of flavor and a texture still soft and moist.

Left-overs are thriftily reduced by the new deliciousness that FIVE ROSES flour imparts. Eager consumption is encouraged by the bright, porous texture, the well-aerated crumb, and the thin, tender crust without cracks.

When you buy FIVE ROSES flour, it is pleasant to know that you are getting more than mere Eating Qualities. You are practising *genuine* Economy.

How to make over 200 Cakes Without Waste

In the famous FIVE ROSES Cook Book, there are hundreds of cake recipes without eggs and with few ingredients for the economical cook, hints for left-overs and scraps that reduce expense. More than 500,000 women are now making their cakes, bread, rolls, puddings and pastries from its 144 pages. If you wish to be successful, send for the FIVE ROSES Cook Book. If you wish to be economical, send 30c. in stamps for YOUR copy. Address: Dept. "C." LAKE OF THE WOODS MILLING CO., LIMITED, MONTREAL and WINNIPEG.

FIVE ROSES FLOUR

FOR BREADS, CAKES, PUDDINGS, PASTRIES

WHEN HOUSECLEANING

An ounce of alum added to each gallon of rinsing water will render lace curtains almost fireproof. When a match head strikes against a curtain thus treated the lace smoulders instead of bursting into flame.

To clean floors, buy a common blackboard eraser and fasten it firmly to an old broom handle. If the eraser is dipped in a little coal oil it will take up all lint and dust and polish the floor at the same time.

When cleaning white enamel woodwork try using sweet milk and ammonia, two tablespoonfuls of ammonia to a quart of milk. The enamel will not turn yellow if this mixture is used.

The very best duster for polished wood is good chamois skin, not too big. Dip it in either hot or cold water and wring it very dry, so that it feels merely damp. Then go over the dusty surfaces till the chamois looks dirty. Wash it clean and wring hard before going on. A little ammonia in the water helps remove possible fingers marks. Always keep changing the water so long as it grows dirty and always be sure that the chamois is clean and well wrung out.

If the top of a kitchen table or the bread and meat board are rubbed with cut lemon and then rinsed with cold water, they will be beautifully white. Cut lemon rubbed on the hands will whiten them and remove stains, even decided and extensive ones. It will also make the skin smooth.

Wet Spanish whiting with water to a paste and apply to windows or mirrors. When dry, merely rub off and the glass will be bright and clean. Woodwork may be cleaned in the same way. To be sure to avoid lint on windows and mirrors, wash with a piece of chamois, though with the whiting this is hardly necessary.

A little starch in the rinse water when one is washing windows, mirrors, lamp flues or glassware is a great aid. Allow the glass to dry before polishing. It will then polish beautifully with very little rubbing. Dry starch may be used to remove grease spots from linen or other white clothing or from table linen. Cover the spot with the powdered starch, let it lie for an hour or two and then brush off with it. If persistently applied, it will remove stubborn grease spots like those from vaseline, especially if laid in the bright sunlight.

YOUR MONEY! NO MATTER HOW SORDID

(Continued from page 487

of boys left the farms of the Maritime Provinces, passed through the horrors of the European nightmare, and many of these boys, the best we had, gave their lives for liberty, justice and righteousness. We ask in the light of Mr. Chipman's suggestion if it does not look as if the struggle had not brought to us that which we most desired. What public man is there in Canada who would attempt to blackmail the manufacturers as Mr. George F. Chipman, editor of the Grain Growers Guide and managing editor of the United Farmers' Guide, has dared to blackmail them. What other man is there who would invite farmers to sit down at table with men whom the Grain Growers Guide denounces as of the criminal class? One would suppose that before he decided to enter upon such a campaign, Mr. Chipman would have weighed the sordidness of his proposition.

May we ask the wives of the farmers of the Maritime Provinces if they desire their boys and girls to be brought to believe that money is money, to be taken by any means from any source and used for any purpose? Do they believe that such doctrines and such principles are calculated to improve their boys, their boys' surroundings or the country of which their boys will be the directors? Do these mothers believe that their boys should be taught to use funds which they regard as stolen, funds used for sapping the public morality, funds stolen from the farmers, and not only to take them but to get them at the point of the pistol? And further, do these mothers believe that the boys of this land should be brought up to not only take such tainted money, but be taught to invite their comrades to share in the takings?

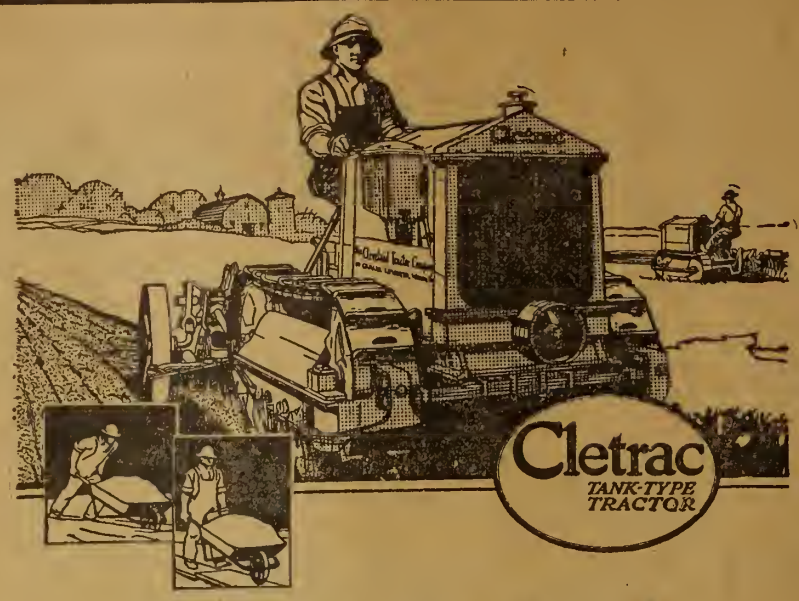
The Maritime Farmer is not weathy. It does refuse hundreds of dollars worth of advertising every year. If the Maritime Farmer thought as the Grain Grower professes to thing, there is not money enough in this country to bribe the owner of this paper to publish advertisements of the class, which Mr. Chipman says he must have and is going to have, if force availeth. When the day comes that this paper is forced for the sake of money to accept advertising from men who are reputed to be robbers of farmers, we'll put up the shutters and get something of an honest turn to do. Let the Maritime Farmer say that in its judgment, the proposal of Mr. Chipman is disreputable and absolutely lacking in elementaries of decency. Mr. Chipman intimates that there are papers which have been bought. Mr. Chipman goes one better and like Faust, is for sale to his own created devil. If the devil is unwilling, Mr. Chipman proposes to use a club on His Satanic Majesty. But why not allow Mr. Chipman to sell himself and not include the farmers of this country in the prize package. Unlike Mr. Chipman, the Maritime Farmer believes there are farmers in this country who will hardly condone any such arrangement whereby they are to be bled white for the benefit of any paper of any class. There is a limit to everything. In the opinion of this paper Mr. George F. Chipman stands out pre-eminent as the proponent of a policy which for pure and unadulterated effrontery eclipses anything heretofore heard of.

May we be permitted to add that these very men who cuss the manufacturers in one breath and blackmail them in the next, are moving heaven and earth to injure the Maritime Farmer. Yet they put up an awful "holler" when they are given a dose of their own medicine. Let us say in all seriousness that if any person does not want to do business with the Maritime Farmer, that is the business of the person concerned, and we shall neither threaten or resort to blackmail.

The manufacturers of this country are not what the Canandian Council of Agriculture would have the farmers of this country believe them to be. They have their faults, as we all have, but they may be pardoned if they refuse to submit to such desperate attacks as those which have been directed towards them by such men as Mr. Chipman.

May we ask in conclusion if Hon. Mr. Crerar is cognizant of the blackmailing program of Mr. Chipman, and whether he approves of it. Does Mr. Crerar agree that money should be forced from the funds of Canadian manufacturers to the coffers of the Grain Growers Guide, to be subsequently used (quoting the Guide's own words) "in support of the policy of the organized farmers of western Canada?" Mr. Crerar must answer. He is now the leader of a political party in this country and his chief political organ has placed him in a rather awkward position.

The columns of the Maritime Farmer are open to Mr. Crerar.



First In The Field

Be first in the field—you can with a Cletrac. It travels on its broad metal tracks, over soft ground.

The Cletrac easily does the work of six horses every day. It will do the work of another six at night if you want it to. It is always ready and there is no such thing as tiring it out.

Plow early, prepare the seed better and be ready to put the seed in at just the right time. Our longest season is all too short. The days saved by the Cletrac this Spring, can be counted in better grain and extra bushels next threshing time.

And the Cletrac not only plows—it will disc, harrow, put in the seed—help do everything connected with planting. One man or a boy can operate the Cletrac easily. It burns coal oil (kerosene), perfectly.

The Cletrac has made good. It is making more friends every day. We now offer you an improved Cletrac with a larger motor, a broader track, an exclusive steering device and a special water air cleaner.

Don't wait until the rush hits you—be ready for it. Buy your Cletrac now and get prompt delivery. There is a dealer near you ready to supply you with a Cletrac and every service you will need with it. See him to-day or write for booklet, "Selecting Your Tractor."

Plowed 40 Acres in 48 Hours

Read What Mr. Taylor Says

My son plowed three hundred acres of land last Spring. He plowed forty acres in forty-eight hours without stopping, except to change drivers and oil. Had it not been for the tractor, through having a wet Spring, I could not have accomplished half. I found out where the tractor cannot go the horses have no business in the field. I consider the tractor lighter on soft ground than horses' feet.

WARTY GROWTHS ON HORSE

I have a horse that has warty growths. What can I do to remove them?

Twice daily rub in best castor oil, olive oil or fresh goose grease. If that does not suffice try the effects of water containing all the bicarbonate of soda it will dissolve when hot. It would be a mistake to use strong medicine on such a condition. Pine tar is effective, but is messy stuff to use on the location mentioned. Large warts may be removed by ligating their bases tightly with a fine cord, or by putting on a few small rubber bands as tightly as possible.

GLEANINGS OF AGRICULTURAL PROGRESS IN N. B.

(Continued from page 491)

wick pens were compared with the average of the Ottawa contest New Brunswick had a lead of 7.3 eggs per pen.

The report of the 20th week (ending March 19th) shows New Brunswick pens occupying the first five places, also eighth, ninth and thirteenth for the total eggs laid to that date. For the weeks production only the eight New Brunswick pens occupied the first eight places except that one other pen tied with one from New Brunswick for third place.

All except one pen of the New Brunswick entries are Barred Plymouth Rocks of strains imported by the Poultry Division of the Department of Agriculture. Their record indicates that they are equal to stock of the other provinces in winter egg production. There is no longer need of sending to the upper provinces for high egg producing stock. Eggs 10c. each, day old chickens 25c each. Both F.O.B. Fredericton. Cash with order. —A. C. McCulloch, Poultry Supt.

A NOTE IN PASSING

A report of New Brunswick's record in the laying contests her breeders have entered appears in the March issue of the Amrican Poultry Advocate, Syracuse, N. Y., one of the biggest United States Poultry Journals. In view of the fact that seldom if ever, are poultry matters of the Maritime Provinces reported in the big poultry journals across the line, this account is worthy of note.

CO-OPERATIVE NOTES

We are receiving many inquiries as to the nails which have been offered at four dollars per keg. We can supply these in almost any quantities. They are new goods but of mixed sizes. They are several dollars per keg under the market prices. For general farm use they are particularly desirable.

We have been asked to supply binder twine this fall to farm organizations and have been promised a supply. However, all those who desire to buy through the Maritime Farmer (and we will sell at cost) should proceed to get their requirements lined up. The buying date will be here very shortly and the man who is in early will get the advantage of the low market. Those who have been buying through the Maritime Farmer service realize that it is the best and cheapest medium in Canada. We are **buyers, not sellers and big profit takers. We serve and do not want all your money in one swipe.**

We have a car of mixed feed containing 100 bags of barley, oats and corn (mixture), 100 bags of barley meal and four hundred bags of ground corn. The car must be taken in full. It is stored at Truro, N. S., and should be a good opportunity to get feed at a close price. We offer it at wholesale price. There is just one car.

We still have a supply of Ford tires (firsts), guaranteed and tubes for same. The price is attractive. While the lot lasts, they are yours at $18 and $2.75 respectively. We pay expressage on two tire orders, and over.

Details of our butter and egg buying departments are not complete at this date. We expect to be able to handle these articles along about the first of May. In our issue of April 27th we will give more details. If you are interested write us in the meantime.

We have enquiries for registered milking Shorthorns as follows: 2 year old heifer in calf; three year old and one year old. Address Maritime Farmer giving pedigrees and prices.

A MARE WITH SWOLLEN LEGS

I have a mare that has swollen legs that only comes back to normal after considerable exercise. She is not lame or stiff when walking. What can be done to remedy this?—W.D.G.

Your mare is suffering from the trouble known as stocking. It is most common in badly ventilated tables; and young horses are more liable to it than old ones. It is often the symptom of some disease that requires attention. Give her Fowler's solution of arsenic morning and night, one ounce for a dose, for a week or two; then allow an interval of a few days and repeat. Do not wash the legs in winter weather. Bandage them tight with flannel bandages when the mare comes in from work or exercise. Remove the bandages when going out for work, and give the legs lots of hand rubbing. Do not iritate them by applying liniments or blistering.

HORSE HAS MANGE

I have a horse that has been idle since October. He is in thin condition and has a rash all over the body and most of the hair has fallen off.

Your horse is evidently suffering from mange. This disease is very contagious and you should take every precaution to keep it from spreading. The cause of mange is the presence of insects, which live in the skin and find their food in the watery discharge which their bites cause to flow. All the affected parts first should be oiled, and washed with warm soap and water, to remove the crusts and dirt, before applying curative ointment, or otherwise it will not reach the insects that burrow into the skin and are invisible to the naked eye. As a successful mange dressing make up the fololwing: Iodine, half an ounce; iodide of potash, one-fourth of an ounce; tar, one ounce; lard, eight ounces. Mix for an ointment . Clean and disinfect all stalls, harness and brushes thta have come in contact with the horse.

Percherons & Belgians
30 Head
Stallions & Mares
FOR SALE

Come to Grenville and buy the kind with the big, round feet, clean, hardy, dry bone and joints, sloping pasterns and straight, flashy action. Buy the kind with the sloping shoulders, short back and long, level croup. Buy the modern Percheron or Belgian.

Our prices are very reasonable, and we will give up to three years time, to responsible parties.

All stallions government inspected.

SELECTING BREEDING BIRDS

(Continued from page 503)

and where the layer of coloring matter is thinnest. The vent is the first part affected. When a bird commences laying the vent is large, moist and yellow. Color disappears very fast however, and from four to six or eight eggs are usually sufficient to bleach it entirely.

Eye-Ring

The eye-ring does not bleach out quite as fast as the vent as a rule, though often nearly so. Eight or ten eggs will usually bleach it completely. In some cases half this number are sufficient.

Beak

After the eye-ring color begins to disappear from the beak commencing at the head and gradually reaching out towards the tip until the beak is entirely void of yellow color. The line of demarkation between yellow and bleached parts is frequently very sharp and clear. In other cases it is not clearly defined. A well bleached beak represents a production of from thirty to fifty eggs, or about four to six or eight weeks of rather heavy laying.

If the color of the upper mandible or the upper part of the beak of Barred Rocks is obscured by black or horn color, the lower mandible or lower part of the beak may be used for estimating production. The slight lemon or yellowish shade of the beak of Wyandottes should not be mistaken for yellow pigment or coloring matter.

Legs or Shanks

Color gradually disappears from the shanks after the bird has reached about a fifty egg mark. The color becomes less intense and a production of 100 to 125 eggs will be accompanied by a considerable if not complete fading of the greater part of the shanks. This means about 18 to 20 weeks of fairly heavy and consistent laying. In many cases a considerably larger number of eggs is necessary to bleach the shanks.

Conditions Influencing Loss of Color

Not all birds will bleach at equal rates. Neither will the same bird under other environmental conditions bleach at the same rate. Under like conditions a large hen will require to lay more eggs to bleach a certain part than will a smaller bird, merely by virtue of her greater size and therefore more coloring matter or pigment. The writer has observed several large birds which have laid as many as 175 eggs or more and still possessed quite a little yellow pigment in the Shanks. Birds fed excessively on yellow corn, an abundance of green food, etc., bleach relatively slow. Birds allowed to range over green grass will bleach slower than those confined to a bare yard or a house, other conditions being similar.

Color of Beak best guide at this Season

As a basic on which to select the best winter layers for breeding purposes the color of the beak is perhaps the most generally useful guide. A bird at this season may have laid sufficient eggs to completely bleach the vent and eye-ring, but if the change was not apparent in the beak she is not necessarily a very valuable winter layer or desirable breeder. Complete loss of pigment from the beak however does signify sufficiently high production to warrant her a place in the breeding pen. The great majority of birds will still have quite yellow legs, so this test is applied only with some difficulty but fairly light colired shanks is a valuable indication of heavy egg-yield.

DUNLOP
CORD TIRES

The Super-Test

¶ BEFORE you are asked to buy or try Dunlop Cord Tires, they must undergo a test such as you would never give them.

¶ Tires just like your garagemen and dealers now sell are put on our own test cars, and away speed the drivers.

—A Test that is kept up day and night.

—A Test that takes in some of the worst roads in the country and the generality of bumps, bad turns, and all the sudden stops that go with them.

—A Test that specifies the number of miles which must be made by the drivers each day and night.

¶ The results of this crucial test, naturally, have an important bearing on our manufacturing policy.

¶ Tested-in-Advance Service aptly applies to Dunlop Cord Tires—"Traction," "Ribbed." Can you ask for a greater guarantee than the story the road tells—a story which in the case of Dunlop Cord Tires proves that our manufacturing methods are not only Right but Dead Right?

BRANCHES IN THE LEADING CITIES

Condition of Abdomen

The bird naturally endowed with heavy egg producing powers is not inclined to become over-fat. The bird not thus naturally endowed is likely to become fat which perhaps gives rise to the frequent remark that hens are "too fat to lay." The fat condition is easily noticed in the abdomen. This part is rather hard and rigid, though not dry and shrivelled like the non-layer. The thick layer of fat under the skin is easily felt and the abdomen is quite full or distended. The abdomen of the heavy producer also is more or less distended, but it is soft and pliable and is filled with greatly enlarged or distended entrails which are essential for immense good digestion and assimilation essential to heavy egg production. By the careful examination of a number of hens layers, non-layers, etc., these points may be easily observed.

Breed from Select Birds Only

In the average flock of twenty-five or thirty birds, e.g., there will most likely be a few non-producers. There will likely be a few moderate producers and perhaps a small number of extra good ones. The latter should be separated from the others, given the very best of care, bred to the choicest most vigorous male, and their eggs only used for hatching. Under ordinary circumstances those which have "slacked" all winter will lay quite heavily during the breeding season and may lay even a little better grade of eggs than those which have been producing incessantly for several months hence when eggs are chosen fo rincubation according to the law of chance, their eggs are more likely to be selected with the result that reproduction is in reality from the least desirable individuals. By such a system little progress towards increased laying capacity can be hoped for.

Good cows, whether pure-bred or grade, come from the use of the best procurable pure-breds and their utility is perpetuated by the use of identically the same kind of bulls.

REPORT OF SUPERINTENDENT OF AGRICULTURAL SOCIETIES FOR NEW BRUNSWICK

(Continued from page 489)

ganized merely for the sake of getting rid of the Government money to the crop growers. The sole idea of the progenitors of the competition was the purpose of creating a healthy rivalry in the production of a better class of seed. The farmer who feeds or sells all his home grown grain and who goes out to buy his requirements for seeding purposes has no right to participate in the competitions. The competitions are intended only for the men who are striving to grow a better class of grain for sale or home use as seed, with a view to improve the quality and increase the yield per acre from year to year.

The standard required to win a prize in 1920 will be raised to 85 points out of a possible 100 points, and each contestant will be asked to get the very best available class of seed.

The first and second prize winners in the wheat and oats competitions in each county are asked to exhibit one bushel samples at the Provincial Seed Fair, Fredericton, on March 16th, when in addition to any prizes they may have won in the field competition or at the seed fair, they will be awarded and additional $3.00 and $2.00 respectively. This plan was satisfactorily carried into effect in 1918. I am rather pleased to note in the report of the Ontario Superintendent of Agricultural Societies, for the year 1919, that while this system was heretofore optional with the competitor in his province, he strongly recommends that it be made compulsory. He also recommends that the artificial treatment of seed oats for show purposes by clipping and spading be not permitted as close clipping tends to injure the seed germ.

Recommendations

Boundaries:

I find a growing tendency for the organization of new Agricultural Societies in districts already well served by existing Societies. I wish to affirm my concurrence in the idea advanced by my predecessorf, Mr. DeGrace, to the effect that each Society be opportioned definite boundary lines and that no new Society be organized within these bounds or within ten miles of the centre of that district except under exceptional circumstances over which your Department would have no jurisdiction.

Delegates Expense Accounts

The present system of refunding to each Society, sending a delegate to the New Brunswick Farmers and Dairymen's Association, one-half of said delegates expenses, is not in accordance with good business practise as the refund cannot be made until many months after the convention has been held. For instance, the expense accounts of the delegates to the 1918 convention did not reach this department until the regular Annual reports came in in the fall of that year. The grants had been apportioned and forwarded before these accounts arrived, consequently no other cheques would be issued until the fall of 1919 when the 1918 expense accounts of delegates went forward in the regular agricultural society grants.

I wish to suggest for your consideration and the consideration of the executive of the Farmers' and Dairymen's Association that each Society furnish its delegate with:—

(1)—A regular credentials card bearing the delegates name, the Society number and the Secretary's signature. This card to be handed by the delegates to the Secretary of the Convention, who, at the close of the Session will hand all the credentials to the Department of Agrcluturie for reference purposes when making refunds.

(2)—A blank expense account form on which the delegate will ufrnish a detailed statement of his expenses, accompanied by vouchers for all expenditures of one dollar and upwards. This expense account to include only legitimate travelling and hotel expenses (no allowance for time) should be presented by the delegate to the Secretary Treasurer of his Society for payment in full within ten days after the close of the convention. These expense accounts would then be forwarded to the Department of Agriculture by the Treasurer of the respective societies for a refund of one-half the amounts, not later than May 1st, when cheques could be issued and thus the Societies would be reimbursed in a comparatively short time, instead of having to wait nearly two years as is the custom under the existing arrangement.

Should you consider it advisable to put this plan in effect this year it would necessitate the paying of the 1919 and 1920 expense accounts in May and all out of the 1920 appropriation but each succeeding years' expense accounts would be borne by the appropriation for its current year.

Acknowledgements

Before closing my report I wish to thank the officers and members of the various Societies for their hearty cooperation in the work in which we are engaged . I also wish to thank the District Representatives and other officials of your department for many suggestions and assistance and with your sympathy and suport Sir, as in the past, I am confident that 1920 will prove the best year in the history of our Agricultural Societies.

M. A. MacLEOD,
Supt. of Agricultural Societies.

Stallion Catalon For Sale

I offer for sale my carriage stallion CATALON, 57741, foaled in 1904.

CATALON is a handsome 15-3 hands, 1075 lbs. mahogany bay of perfect conformation and sound. He had trotted a trial mile in 2.14¼, last ¼ in 32 seconds. Perfectly clever and kind. He is sired by Bingen 29567, record 2.06¼. Catalon's dam was the great race mare Improvidence, 2.12, by Prodigal, 2.16, and dam of Owassa, 2.06¾, full sister of Catalon. Catal is a half brother of Uhlan 1.54½, the world's champion trotter. Cataion sired the second fastest two two year olds ever raised in this province, Ima Catalon winning the race in Summerside in 1917. Second heat in 1.12½. This is a very speedy mare and I feel will make a great race mare. She is also for sale. If interested, come and see her.

FIFTEENTH ANNUAL MEETING OF N. B. FRUIT GROWERS' ASSOCIATION

(Continued from page 507)

orchards and increased confidence of our growers.

In conclusion he said, "The last month concluded my tenth year as Secretary of this Association and also as Provincial Horticulturist, and I am happy to say that from every point of view, it was the most successful and encouraging since I came to the province. The building up of scattered elements of fruit growing into a real fruit growing industry, is not a problem capable of easy or early solution or productive of spectacular results—but it is a thing that once accomplished, adds, one might almost say, forever, to a countrys happiness and prosperity, and he or she who plays a part in such a work, as the members of this Association are doing, will in this respect, at least, have served their country well. We have made good substantial progress—we have got many of our older orchards into better shape and we have established some fine new commercial orchards which may be likened to the first story of brick in the new factory, which we are building, resting on the foundation of our older orchards. You have done much—but there is much more to be done and every reason and encouragement to carry on with increased effort and enthusiasm.

Acceptance of the Secretary's report was moved by S. B. Hatheway, and seconded by W. W. Hubbard, who, in a few words reviewed the success of this province as a fruit-growing country. The fact that New Brunswick had come through the recent severe winter so much better than the west, proved the fitness of the climate and should be a great encouragement to the growers.

Mr. G. E. Sanders, of the Dominion Entomological Laboratory, Annapolis Royal, Nova Scotia, then read a paper on "Apple Tree Spraying in New Brunswick," referring particularly to the results obtained by his Department in New Brunswick, in the control of Green Apple Bug and Apple Maggot or Railroad Worm. The results and commercial value of this work was strikingly set forth by means of large charts prepared by the Horticultural Division. Mr. Sanders explained in detail the spraying calendar recommended for use in New Brunswick in 1920, and his address was followed by many questions and a good discussion, which concluded the morning session.

The afternoon session was opened by the reading by W. W. Hubbard of a letter from Dr. George M. Twitchell of Augusta, Maine, to A. G. Turney, Secretary Treasurer of the Association. Dr. Twitchell wished the members success in all their undertakings and expressed a deep desire to be able to discuss with the growers of this province the conditions of supply and demand. He emphasized the value of spray and dust as a prevention against plant and fruit diseases. In another letter to Mr. Hubbard, he dealt largely with the raising of plums. He urged fewer varieties of apples, more complete fertilization, the breaking up of blocks and the more free use of lime.

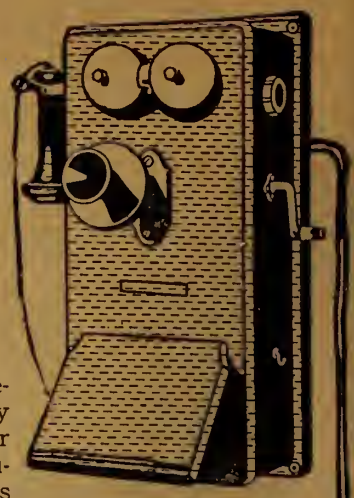
At the afternoon session, S. B. Hatheway of Kingsclear, gave his experiences on his orchard of 6,000 trees at Kingsclear. He explained the mulch system of growing the apple trees; the method of applying pine tar for protection of the trees against mice, and the shaping and pruning of the tree.

S. L. Peters, of Gagetown, referred to the first commercial exhibit of apples made by him at a Farmers' and Dairymens' meeting in this city in 1878, when he had a hard time to convince the members of the Association then that the apples were products of his own orchard. He discussed briefly the Golden Russet and advised the grocers not to go in for a too heavy planting of this variety, as it was a light bearer.

Superintendent W. W. Hubbard of the Experimental Farm gave a general talk on conditions in the province for apple growing, touching upon the necessity of protecting the growing trees against the ravages of mice. He also explained an inexpensive system of cultivation which had brought good results at the Experimental Station.

C. W. Baxter, Dominion Fruit Com-

Economical to Maintain



You can't figure the cost of a telephone on the day you buy it — its the money spent for repairs that counts.

Stromberg-Carlson Telephones

are built better than may seem necessary to insure maintenance economy. The telephone, for example consumes less battery current while operating and gives better transmission than other kinds of instruments—which means less frequent renewals of the battery. When you pay less than our price you get less than our quality.

ST. JOHN, N. B.
Head Office
WEST TORONTO, ONT

missioner, of Ottawa, was the next speaker. He expressed an earnest desire to help along the industry and thought that the fruit growers did not get together often enough. He expressed wonder that the production of fruit was not greater in this Province. It is Mr. Baxter's intention to visit New Brunswick in the next growing season and examine the conditions then. The great trouble in Ontario is not the supply but the poor system of marketing, and this was one thing that the New Brunswick men should try to overcome. After reviewing conditions in Canada and United States, he showed that we are just about where we were twenty-five years ago, as far as fruit farming is concerned, and that the outlook for this business was never brigher. He advised specializing in certain varieties and letting others strictly alone. The public is becoming more discriminating and its demands must be satisfied. The packing and marketing should be under the supervision of an association to obtain the best results. Regarding small fruits, he said that the acreage had decreased since 1910, until today the canners are importing large quantities of that fruit from the States.

L. T. Floyd, Provincial Apiarist, was the next speaker and dealt very ably with the small fruit question, drawing many examples from his own experience in the business at his home in Kings County. He explained in detail the system of planting, caring for, picking and shipping the product and declared that St. John is the poorest local market for berries. Colonel O. W. Wetmore, the President, also spoke on this subject and there was a general discussion which concluded the afternoon session.

Mr. E. P. Bradt, the Secretary for Agriculture was the first speaker on the evening program. He stated that he was very favorably impressed with the work of the fruit growers of the province. Both climatic and soil conditions he said, were good and the fame of the Provincial Fruit Growers' apples spoke well for the future of the apple growing industry. What had been done in the past year concerning the cooperative marketing showed well what the fruit growers could do when they got together. He considered that the prospects for the industry were never brighter than at the present time, and he assured the members of the Association of the hearty cooperation of the Department of Agriculture at all times.

The Resolutions committee, composed of W. W. Hubbard, Fredericton, S. B. Hatheway, Kingsclear, A. R. Gorham, Greys Mills, H. H. Smith, Hoyt Station and W. B. Gilman of Kingsclear, then presented their reports. A committee was appointed to present the following resolutions to the Minister of Agriculture.

"Realizing the growing importance of the fruit industry as evidenced by the splendid returns for apples and berries shipped the past season to Upper Canadian markets, this Association in Annual Convention assembled, desires to place on record its appreciation of the valuable assistance given by the Horticultural Branch to the growers in the grading and packing of their fruit. We recognize that in order to further increase production and maintain the high quality of our fruit, every possible means should be provided for the Horticultural Department to increase the scope of its work, and that a Committee be appointed to interview the Minister of Agriculture to this end."

"WHEREAS, there are some great advantages in using a dust spray instead of a liquid spray for horticultural operatoions and, WHEREAS, dusting machines have not yet been generally introduced—RESOLVED that we request the Horticultural Branch of the Provincial Department of Agriculture to procure one of the best available power dusters for demonstration purposes this year."

Resolutions approving of the holding of Orchard Field Days at various points throughout the province, also of the holding of a Canadian National Apple show at Toronto next December and pledging support thereto were passed. The meeting also elected Messrs. C. W. Baxter, George H. Vroom and W. S. Potts, honorary members of the Association and passed votes of thanks to the Fredericton City Council for the use of the Council Chamber and to Colonel O. W. Wetmore, the retiring President; and instructed the executive to make a contract for apple barrels for the coming season.

The report of the resolutions committee was followed by a general discussion on marketing and packages, in which the growers were not at all backward in expressing their dissatisfaction with St. John as a market for fruit.

The following officers were elected for 1920:

Honorary President—S. L. Peters, Queenstown.

President—A. R. Gorham, Greys Mills.

Vice-President—W. B. Gilman, Kingsclear.

Secretary Treasurer—A. G. Turney, Fredericton.

Additional members of executive—T. A. Clark, Chartersville; A. G. Dunphy, Douglas.

CHOICE BERKSHIRES

"Valley View Farm,"
Truro, N. S., April 6, 1920

Editor, The Maritime Farmer,
Dear Sir:—

We have at present the best offering in Berkshire pigs we have ever had.

Most of the younger ones are sired by Concord of Meadowvale, a grandson of the great Successors Double, that sold in the U. S. for $1100.00, when a year old. Besides being a large boar of good showring quality, he is a splen-

of good show-ring quality, he is a splen-

He sired the Undefeated under six months pigs of the N. B. shows last fall, and the 1st, 2nd, 3rd and 4th prize sows at Amherst, under nine months class. One of these sows won as best sow in N. S., any breed, under nine months.

Our brood sows, with one exception, are daughters and grand-daughters of the undefeated boar, "Woodstock Pat," champion of the Maritime Provinces, 1916-1917.

We have sows weighing up to 700 lbs., and get as high as 13 pigs to the litter. At Fredericton last Fall, where we had the most competition, we won 1st yearling boar; 1st boar over 6 and under 12 months; 1st boar under six months; 1st, 2nd and 3rd sows over two years; 3rd sow under two years; 1st and 2nd sows under 6 months; 1st sow and litter; 1st and 2nd herds, (boar and three sows).

We had competition in every class except one, viz., boars under 12 months, over 6. Our herd was started 30 years ago, and we ship on condition that if a purchaser isn't satisfied, he may return his purchase and we will refund his money, including all shipping charges. So far, none have come back.

Two years ago we priced a young boar at $10.00; the man thought it was an awful price to pay for a little pig, but he wrote that he was well pleased with him. Last Spring he wanted a young sow. He asked no question, just told us to send him one and send the bill with it. Later, he said—"You certainly did a good job on the pigs you sent me. I think I have the best boar and sow in the Province of N. B." A few days ago he sent us another order and said the sow we sent him had twelve pigs. We have about fifty pigs now.

Yours truly,
J. R. SEMPLE & SON.

MARE HAS SCOURS

What can be wrong with a mare that is in good condition and has a sleek coat, was working hard all winter and fed on dry hay and oats, but scours when she gets heated at work? Is there any way of stopping the scouring?—T. P. P.

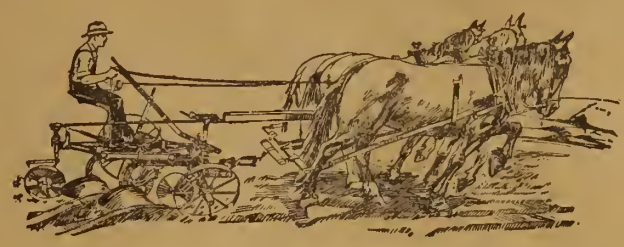
A horse that eats too rapidly is liable to scour, also driving immediately after feeding, and the quality of the water has many times something to do with it. Disorders of the liver and constitutional tendency are other causes. Flat-sided and narrow loined horses particularly are said to scour often without apparent cause. The discharge must not be checked too suddenly. A half teacupful of catsor oil, combined with an ounce of laudanum, and given as a drench with a little linseed gruel is excellent. Oak-bark tea, made by steeping the inner bark of white oak, is good for persistent cases. A teacupful of this tea, combined with an ounce of laudanum, should be given as a drench twice daily. Horses that are subject to scouring while on the road should be fed and watere as long as possible before putting to work. Water sparingly immediately before and during the drive.

GET HARNESS READY FOR WORK

Spring plowing gives the work harness a good test. Many times breaks will occur and a loss of time results because of carlessness in the handling of the harness in the stable during the winter months or neglect in giving teams the proper hitch. Harness is expensive and the teamster who takes good care of it is the one to gain. In the first place the life of a harness may be greatly shortened by improper hanging when not in use. Dampness should be avoided and the ammonia from the manure should not be allowed to come into continual contact with the harness. At least twice a year the harness should be overhauled which should include taking it entirely apart to clean and oil. A rainy day in March is a good time for an overhauling that will insure agains a loss of time when the rush season comes on. Careful attention should be given to each piece to see that there is no break starting and that all metal is free from rust. The leather can best be cleaned with soft water and soap and in case of collection of manure are present it may be necessary to soak the harness in water for a short time. When the leather is clean and dry, a harness oil should be rubbed into the leather. In no case should a dryin oil like linseed oil be used. The metal can be polished or thoroughly soaked in oil to prevent rusting. Proper and prompt attention to the harness will double its life and prevent needless expense and loss of time during the cropping season.

A comparison of analysis of Maine grown potatoes with similar anlaysis of potatoes from other American sources is held to indicate thta Maine potatoes contain approximately 1.5 per cent. more dry matter than all other American potatoes.

Massey-Harris



A Good Job of Plowing

EVERY Farmer takes pride in a well plowed field and recognizes the value of good Plowing. But unless you have the right kind and make of plow, plowing is a strenuous and unsatisfactory job. Massey-Harris Plows are the kind that make plowing both pleasurable and profitable. They are the result of over seventy years experience in the art of plow-making.

They turn and cover perfectly and clean readily. Their excellent scouring qualities enable you to get on the land earlier than with other plows. And they are light draft and easy to handle.

Walking Plows, Riding Plows, Disc Plows, Engine Gang Plows, etc., in many Styles and Sizes.

SHEEP BREEDERS ORGANIZE

(Continued from page 493)

crease in Pure Bred Sheep in N. B. as compared with N. S. and P. E. I.

Registration by Provinces

	1918	1919	Increase	% of increase
N. B.	221	326	105	47½
N. S.	145	185	40	24
P. E. I.	144	180	36	25

"Now, Mr. Chairman and Gentlemen, I want to bring one matter before you that New Brunswick stands at the head of the list for Canada and I can make that still stronger in that as far s I know we stand at the head of the list for America and that is the Inspection and Classification of our Pure Bred Rams. This is certainly a big step in the right direction and are we going to let this matter drop merely from not giving it the support it needs. If for no other reason I think it would be well worth while to form an Association.

"Again, the sheepmen as a whole are realizing the advantage of the co-operative marketing of their wool and there is every indication that 100,000 lbs. will be marketed in that manner this year and while the Provincial Department is willing to carry on their work for you this year it does not mean that they will see their way clear to do so indefinitely, therefore it is undoubtedly up to you men to look forward and prepare yourselves to carry on this work that means a good many dollars to the sheepmen of the Province.

"Still further there is every indication that a great deal can be done to improve the marketing facilities of our butcher lambs. This has been clearly shown by the work conducted last fall in this line when a gain of $5,000.00 was made on 2602 lambs marketed co-operatively.

"I have brought up these points namely:

1.—Inspection and Grading of our Pure Bred Rams.

2.—Co-operative marketing of your wool.

3.—Co-operative marketing of your lambs.

"That, I think, more than warrants the forming of a Provincial Sheep Breeders' Association, so that the sheepmen may direct and further along with a great many others."

The officers elected were as follows:

President—A. E. Trites, Salisbry.

Vice-President — Burder Goodwin, Baie Verte.

Sec'y-Treasurer—A. C. Taylor, Salisbury.

Directors—1, Restigouche Gloucester and Narthumberland Counties, Albert Payne, W. Bathurst.

2.—Kent and Westmorland, Burder Goodwin.

3.—Albert and Kings—Geo. A. King, Sussex.

4.—St. John. Queens, Sunbury, Charlotte, Stanley Wilson, Rolling Dam, Charlotte.

5.—York, Carleton, Victoria, Madawaska, E. W. Spinney, Windsor, Car. Co.

General Directors—W. E. Wallace and A. E. Trites.

Auditor—J. M. Crandall, Salisbury.

The following resolutions were passed:

Whereas, it is in the interest of the Shep Breeders of New Brunswick to form a Sheep Breeders' Association,

And whereas, with one exception, each Province in the Dominion has a Sheep Breeders' Association,

And whereas, it is necessary to have the Sheep Breeders organized.

Therefore, be it resolved, that a New Brunuswick Sheep Breeders' Association be formed.

Moved by Burder Goodwin, seconded by W. E. Wallace.

* * *

Whereas, it is necessary for the New Brunswick Sheep Breeders to adopt a Constitution for the operating of their Association.

Be it resolved that the following Constitution be adopted.

Moved by W. H. Venning, seconded by Burder Goodwin.

A Smooth-running Beauty Winter and Summer!

THIS ENGINE began with a resolve to produce an engine second to none in the world. Once we accomplished that, we turned our efforts to cutting down the cost by standardizing all parts and simplifying every operation in the factory.

Now, we have a high-grade engine at a moderate price—vertical type, as used in high-priced autos, four cycle, water-cooled, with every modern feature. You'll like the LONDON Engine fine. Plenty of power—FROSTPROOF and unconditionally guaranteed.

Resolution Relative to the Bonus Given to Flock Owners on the Use of a Pure Bred Ram

Whereas sheep raising in N. B. is a very important industry and whereas the success of this industry depends, as with other lines of stock, on the use of well developed pure bred males, and

Whereas, the $5.00 bonus given in the fall of 1919 by the New Brunswick Department of Agriculture was the means of getting a number of owners of grade flocks, who had not

From the Cedar Forests of British Columbia to the Apple Orchards of Nova Scotia ~ the Favorite is

MACDONALD'S TOBACCO

"The Tobacco with a heart"

SMOKING CHEWING

previously used a pure bred ram on their flocks, to purchase and use a pure bred registered ram, and

Wheeas, there are a large number of sheep owners who have never had a chance to see for themselves the benefits derived from the use of a pure bred ram, and

Whereas, this policy of bonusing rams has been the means of placing a large number of pure bred rams at the head of grade flocks,

Therefore, be it resolved, and urgently requested that the New Brunswick Department of Agriculture continue their good work as in 1919 on the bonusing of pure bred Registered Rams.

Moved by W. H. Venning, seconded by G. E. King.

* * *

Resolution Relative to the Grading of Pure Bred Rams

Whereas sheep raising in N. B. is a very important industry, and

Whereas the success of this industry depends to a very great extent on the use of good pure bred sires, and

Whereas the inspection and grading of lambs as carried on by the New Brunswick Department of Agriculture in the fall of 1919 protected both the large and small breeders in the purchasing of pure bred rams for service, and

Wheeas a greater number of good pure bred rams were used due to security with which the breeder can purchase his by mail, and

Wheeas the breding and selling of inferior rams is reduced by this method of grading, and

Whereas this method of grading benefits both the pure bred breeder and the owner of a grade flock and tends to place the sheep industry on a higher and firmer basis,

Therefor,e be it resolved, that the Department of Agriculture be most urgently requester to continue the inspection and grading of rams as was carried on as in the fall of 1919.

Moved by W. H. Venning, seconded by Burden Goodwin.

* * *

Whereas the demonstrations carried on by the Federal and N. B. Departments of Agriculture in shearing, dipping, docking and castrating has been very helpful and instructive, not only adding considerable to the pocket of the owner, but also greatly increasing the health and comfort of the stock,

We urge that this work be kept up as in the past.

Moved by H. A. Secord, seconded by H. N. Flewelling.

* * *

The charter members of the Association are Burder Goodwin, Baie Verte; A. E. Trites, Salisbury; J. K. King, Moncton; H. A. Secord, Penobsquis; J. W. McLeod, Penobsquis; H. N. Flewwelling, Studholm; Joseph T. Barnes, Studholm; G. A. King, Smiths Creek; F. W. Walsh, Fredericton; R. H. Pearson, Belleisle Creek; W. E. Wallace, Penobsquis; H. A. Wallace, PenobSquis; W. H. GOOD TREATMENT OF CALVES

It is important to handle calves with gentleness. When teaching them to drink, control the temper and the work is not difficult. A hired man who swears and kicks at calves because they are slow in learning to drink is not a good business proposition for a dairyman. An employee who thinks a lot of the calves and shows an interest in them should be substantially rewarded. He is the type of man that the dairy farmer needs.

Rough treatment of calves develops cows which are unruly and difficult to manage. The writer knows of one heifer that was friendly as a calf and the children often teased her and had pushnig contests with her to see which was the strongest. As the calf grew it became dangerously ugly and had to be killed to eliminate the chances of a serious accident to some members of the family. When raising bull calves it is doubly important to handle them firmly but gently and not allow them to find out their own strength.

Small sections of iron stanchions are fine for feeding. Each calf will soon learn to take its proper place at feeding time and each will then receive its right portion of feed. When calves of different ages are fed together the weaker animals are often crowded out and receive less than their share. A large calf feeding trough is apt to be insanitary because of the difficulty of scalding it. Galvanized pails can be scalded easily and this is a factor in keeping down disease and raising vigorous calves. The pails can be numbered with paint and each calf use the same pail at each feeding. When calves are raised to replace cows in the dairy herd, much of the future value of the herd depends on the quality and vigor of the calves. It is better to feed a few and do it right than to try and raise twice as many on short rations.

In the winter when the calves are housed in pens it pays to give them plenty of clean straw bedding. It seems as if the youngsters do much better and have more vigor when they ar ehoused in clean pens with a cushion of warm, clean straw on which to rest.

Preparing cows for tests, feeding and caring for them during the test, requires very careful, patient, skillful and persevering work, but the individual will be amply repaid for his trouble.

Lawndale Stock Farm

Jerseys and Shorthorns (Pure Bred)

We are at present, owing to increased demand and sales, about sold out, with the exception of one young Durham bull, dropped in July, 1919—but watch our new offerings during the summer of 1920.
